

The Rules of Reading

**I Will Read or Listen Like AudioBook On Phone or Other Technology
The Rules of Reading All Parts, On Daily Basis And Apply The Steps of
The Rules of Reading To Tasks, Deep Work, Deep Studies, Learning and
Studies, Values, Personal Life, Professional Life, Reflect and Review Of
Day, Journaling and Visualisation.**

- 1. Stop Doing Less Than Absolutely Your Best**
- 2. Skim Book Before Make Decision if I Want To Proceed or Quit Bad Books:**
- 3. If You Want To Quit Bad Books. Great rule is 100 pages minus your Age.**
- 4. Take Notes After 2nd Inspectional Reading.**
- 5. Read Or Listen A Book Daily.**
- 6. Never Speed Read The Book For Comprehension.**
- 7. Spend lots of time reading or listening the book.**
- 8. Read OR Listen Classical Book.**
- 9. Study Foundation of The Topic in Order to Proceed To Advance Level.**
- 10. Try To Apply The Book To Your Life. Point of Book not to look Smarter but do better in Life**

Brain Like Muscle, The Harder You Use, The Stronger it Becomes.

- 1. When Studying Any Topic, Start To Learn Foundation of The Topic.
Once You Know the Foundation of the Topic, then It is Easy To
Understand Advanced Level of The Topic. Without Learning
Foundation, You Cannot Progress Further.**
- 2. Focus And Act On What You Can Control And Influence Instead Of
What You Can't. Control What You Can And Do Not Worry About
Things I Cannot Control.**

"If You Don't Read Newspaper You are uninformed. If You Do Read It You Are Misinformed. What are the Responsibilities The Reporter Has? The Responsibility Of Reporter Is To Tell The Truth, Not Just To Be First, But To Tell The Truth. We Living In The Society, Where Just First Is Priority, who Cares, Just Get It Out There, Do Not Care Who Would It Hurts, Do Not Care Who Would Destroy, Do Not Care If It Is True, Just Say It And Sell It." **Denzel Washington**

If you want your name to be remembered after your death, either do things worth writing, or write things worth reading."
- Benjamin Franklin.

If You Don't Produce You Won't Thrive – No Matter How Skilled Or Talented You Are. Human beings, it seems, are at their best when immersed deeply in something challenging. If you service low-impact activities, therefore, you're taking away time you could be spending on higher-impact activities.

Two Core Abilities for Thriving in the New Economy

- 1. The ability to quickly master hard things.*
- 2. The ability to produce at an elite level, in terms of both quality and speed.*

Cal Newport.

IF You Not Study Or Learning History. History Tend To Repeat Itself. Always Try To Understand Historical Past Facts From Both Sides And Build On That Understanding Further. This Helps To Look AT The History Holistically And Understand The Future and Where Civilization Is Moving Toward.

The Table of Content

Part 1: What Do Not Do For Deep Work, Deep Study and Bible Study

- 1. Step 1-Reasons Do Not Read Generally The Newspaper On Daily Basis. Pages 18-19**
- 2. Step 2-Reasons Do Not Use Internet. Pages 20.**
- 3. Step 3-Reasons Do Not Use TV and Youtube. Pages 21-22.**
- 4. Step 4-NOT MULTITASK. Page 23.**

Part 2: Steps In Choosing Topic, Skimming The Books, Articles Debate, Discussion For Deep Work Or Deep Study Or Bible Study.

- 1. Step 5-How To Become Polymath. Page 25.**
- 2. Step 6-Choose The Topic. Pages 26-35.**
- 3. Step 7-Three Questions to Ask Yourself Before Saying YES to a New Commitment. Pages 36.**
- 4. Step 8-What Tools I Will Use For Learning? Page 37.**
- 5. Step 9-Narrow Down Subject or Topic. Pages 38-39.**
- 6. Step 10-Information Overload: Why we're facing it and how to handle it. Pages 40-41.**
- 7. Step 11-Compile Resources And Create Curriculum. Page 42.**
- 8. Step 12-Filter Resources. Pages 43.**
- 9. Step 13-Choose A Book, Article, Talk, Discussion, Debate, Speeches, Research, Newspaper, Journal And Give The Reason of The Choice. Pages 44-46.**
- 10. Step 14 Skimming: Intelligently Skimming Through The Book or Text. VERY FAST READING AND SKIMMING Pages 47-51.**
- 11. Step 15- Find Out What Kind of Resource is this? Pages 52-53.**

Part 3-Rules of Reading for Entertainment and Basic Understanding For Deep Work, Or Deep Study, Or Bible Study.

- 1. Step 16-Decide The Rules for Entertainment and Basic Understanding For Deep Work or Bible Study. Page 55.**
- 2. Step 17-Dive In. Page 56.**
- 3. Step 18-Use The Chosen Rules of Reading Method For Entertainment Or Basic Understanding and Follow Each Steps Of The Method Until Finish All Steps, And Follow Each Steps As many Times As I Want, While Re-listen Lectures, Read Books or Lecture Notes 1-1000 Times For Each Step. Pages 57-74.**

A. VERY FAST READING- Entertainment.

- I. Method 1-Speed Reading. Very FAST Reading. Pages 59-64.**

B. FAST READING: Methods for Basic Knowledge For Deep Work or Bible Study.

- I. Method 1-Survey, Question, Read, Recite, Record, Reflect (SQ4R). Pages 66-67.**
- II. Method 2-Use 80/20 Principle For Reading. Pages 68.**
- III. Method 3-Preview, Question, Read, Summary,Test (PQRST). Page 69.**
- IV. Method 4-Flip Through Pages and Analyse. Page 70.**
- V. Method 5-Devotional Bible Study by Using Devotional Books. Pages 71-72.**
- VI. Method 6-Devotional Bible Read. Pages 73-74.**

- 4. Step 19-Ask Question. While Re-listen Lectures, Read Books or Lecture Notes 1-1000 Times. Page 75.**
- 5. Step 20-Take Notes. Pages 76-91.**
 - The Blank Sheet.**
 - Conventional Notes.**
 - Note Taking.**
 - Cornell Note Taking.**
 - Richard Feynman Note Taking Technique.**
 - Flow Chart.**
 - Cornel Note Taking 2.**
 - Analytical Learners.**
 - Sentence Method.**

- SQ3R.
 - Mapping.
 - Smart Wisdom.
 - Diagram and Processes.
 - Charting.
 - CERC
 - Use Smart Notes
6. **Step 21-Ask Question. While Re-listen Lectures, Read Books or Lecture Notes 1-1000 Times. Page 92.**
 7. **Step 22-Basic Exploration, Experimentation and Practice. Page 93.**
 8. **Step 23-Take Notes. Pages 94-109.**
 - The Blank Sheet.
 - Conventional Notes.
 - Note Taking.
 - Cornell Note Taking.
 - Richard Feynman Note Taking Technique.
 - Flow Chart.
 - Cornel Note Taking 2.
 - Analytical Learners.
 - Sentence Method.
 - SQ3R.
 - Mapping.
 - Smart Wisdom.
 - Diagram and Processes.
 - Charting.

Part 4: Rules of Reading For Bible Study, Deep Work, Deep Study, Powerful Goodness.

- 1. Step 24-Decide The Rules of Reading For Bible Study, Deep Work. Page 111.**
- 2. Step 25. How Many Pages Read A DAY. Page 112.**
- 3. Step 26-Do Not Speed Read. Page 113.**
- 4. Step 27- Slow Down. Pages 114-116.**
- 5. Step 28- Isolating Myself For Bible Study and Deep Work. Pages 117-119.**
- 6. Step 29-Power of Concentration. Pages 120-124.**
- 7. Step 30-You Have Required To Do The Work to Have an Opinion on Any Topic. Pages 125-140.**
- 8. Step 31-Use The Chosen Rules of Reading Method For Bible Study, Deep Work, Deep Study. And Follow Each Steps Of The Method Until Finish All Steps, And Follow Each Steps As many Times As I Want, While Listen Lectures, Read Books or Lecture Notes 1-1000 Times For Each Step. Pages 141-307.**
 - A. Deep Work, Deep Study, Bible Study or Any Book- SLOW Reading-Complex Text.**
 - I. Method 1-Chapter Summary Method. Pages 143-147.**
 - II. Method 2-Character Quality Method. Pages 148-160.**
 - III. Method 3-Thematic Method. Pages 161-163.**
 - IV. Method 4-Biographical Method. Pages 164-176.**
 - V. Method 5-Topical Method. Pages 177-180.**
 - VI. Method 6-Word Study Method. Pages 181-189.**
 - VII. Method 7-Book Background Method. Pages 190-194.**
 - VIII. Method 8-Book Survey Method. Pages 195-205.**
 - IX. Method 9-Chapter Analysis Method. Pages 206-215.**
 - X. Method 10-Paragraph Study. Pages 216-229.**
 - XI. Method 11-Verse by Verse Analysis Method. Pages 230-234.**
 - XII. Method 12-Book Synthesis Method. Pages 235-238.**
 - XIII. Method 13-Theological Study Method of Bible Study. Pages 239-245.**
 - XIV. Method 14-Studying Bible Prophecy. Pages 246-259.**
 - XV. Method 15-Typological Study Method. Pages 260-262.**
 - XVI. Method 16- John MacArthur Way Bible Study. Pages 263-268.**
 - XVII. Method 17-Inductive Bible Study Method. Pages 269-296.**
 - XVIII. Method 18-BIBLICAL HERMENEUTICS. Pages 297-302.**

XIX.Method 19-Theological Group of Principles. Pages 303-306.

XX.Method 20- How To Read A Book Pages 307.

Part 5: Rules of Reading For Deep Work, Deep Study, Bible Study.

- 1. Step 32-Decide The Rules of Reading For. Deep Work, Shallow Work, Bible Study Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method. Pages 308-309.**
- 2. Step 33. How Many Pages Read A Day. Page 310.**
- 3. Step 34-Do Not Speed Read. Pages 311.**
- 4. Step 35- Slow Down. Pages 312-314.**
- 5. Step 36- Isolating Myself For Bible Study AND Decide The Study or Work Philosophy. Pages 315-317.**
- 6. Step 37-Power of Concentration. Pages 318-322.**
- 7. Step 38-You Have Required To Do The Work to Have an Opinion on Any Topic. Pages 323-338.**
- 8. Step 39-Use The Chosen Rules of Reading Method For More In-depth Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method. Use These Methods To Do Very DEEP Analysis of the Text or Topic Than Previous Methods. Follow Each Steps Of The Method Until Finish All Steps, And Follow Each Steps As many Times As I Want, While Re-listen Lectures, Read Books or Lecture Notes 1-1000 Times For Each Step- VERY VERY SLOW Reading-Complex Text. Pages 339-942.**
 - A. VERY VERY SLOW READING- COMPLEX TEXT. Deep Work, Shallow Work, Bible Study, Analysis of Text, Research, Investigative Journalism, Investigation and Syntopicon, Mixed Method.**
 - I. Method 21- How To Read A Book By Mortimer Adler Various edition Pages 341.**
 - II. Method 22-How To Read A Book For Various Books. Pages 342-600.**
 - III. Method 23- Syntopicon Pages 601-642.**
 - IV. Method 24-The Craft of Research. Pages 644-882.**
 - V. Method 25-Research Books can Be Used. Pages 883-897.**
 - VI. Method 26-Investigative Journalism. Pages 898-923.**
 - VII. Method 27-Mixed Methods of Rules of Reading. Pages 924-942.**

Part 6: Analysis Of Book By Using External Sources.

- 1. Step 40-Aids To Reading, Listening, Conversation, Debate. Pages 944-957.**
- 2. Step 41-Commentaries On Book and What Are Other's Take on? Pages 958.**
- 3. Step 42-Review Of The Book. Pages 959-962.**
- 4. Step 43-Analysing Author and Publisher and Audience. Pages 963-966.**
- 5. Step 44-How To Spot Bad Science. Pages 967-977.**
- 6. Step 45-Content Of Critical Review. Pages 978-979.**
- 7. Step 46-The Funding of Book, Author, Publisher, Speaker, Presenter, School, Government, Politician, Companies, Influencer, Newspaper, Journalist or Other Person. Pages 980-1017.**
- 8. Step 47-Was There Propaganda and Conspiracy Theories In the Book and Propaganda Analysis. Pages 1018-1025.**
- 9. Step 48-What did I take From the Book. Pages 1026-1031.**
- 10. Step 49-Implication of The Book. Pages 1032.**
- 11. Step 50-My Arguments For Or Against The Author, Writer, Speaker, Debater. Pages 1033-1035.**
- 12. Step 51-Improve My Arguments and I would Have Another Chance, how would I Approach. Pages 1036-1037.**
- 13. Step 52-Basic Exploration, Experimentation and Practice. Pages 1038.**
- 14. Step 53-Note Taking. Pages 1039-1054.**
 - The Blank Sheet**
 - Conventional Notes**
 - Note Taking**
 - Cornell Note Taking**
 - Richard Feynman Note Taking Technique**
 - Flow Chart**
 - Cornell Note Taking 2.**
 - Analytical Learners.**
 - Sentence Method.**
 - SQ3R.**
 - Mapping.**
 - Smart Wisdom.**
 - Diagram and Processes.**
 - Charting.**
 - CERC**

- Use Smart Notes

15. Step 54-Simplify The Topic For Myself First. Pages 1055.

16. Step 55-Reflect, Refine And Simplify. Pages 1056.

17. Step 56-Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, Journal, Newspaper, podcast or any other resource and source – and fill the gaps in your knowledge. Pages 1057-1059.

Part 7: Thinking, Logic and Mental Model For Deep Work or Deep Study, Or Bible Study

1. Step 57- Slow Down. Pages 1061-1063.

2. Step 58- NOT MULTITASK. Pages 1064.

3. Step 59-You Have Required To Do The Work For Thinking and Applying Mental Tool Models. Pages 1065-1080.

4. Step 60-Why Critical Thinking, Logic, Thinking and Mental Tools Are Important? Pages 1081-1083.

5. Step 61-Intradisciplinary Thinking. Pages 1084-1125.

6. Step 62-Multidisciplinary Thinking. Pages 1126-1168.

7. Step 63-CrossDisciplinary Thinking. Pages 1169-1211.

8. Step 64-Interdisciplinary Thinking. Pages 1212-1254.

9. Step 65-Transdisciplinary Thinking. Pages 1255-1298.

10. Step 66-Journaling. Pages 1299.

11. Step 67-Letting The World Do The Work For You. Pages 1300-1305.

12. Step 68-Journaling. Pages 1306.

13. Step 69-Letting The World Do The Work For You. Pages 1307-1312.

Part 8: Simplify Explanation and Creating Analogies.

1. Step 70-Simplify your explanations and create analogies. Streamline your notes and explanation, further clarifying the topic until it seems obvious. Additionally, think of analogies that feel intuitive. Pages 1314.

Part 9:Reflect, Refine and Simplify.

1. Step 71-Reflect, Refine, and Simplify. Page 1316.

Part 10:Organise And Review.

1. Step 72-Organise And Review. Pages 1318.

Part 11:Deep Work and Application.

- 1. Step 73- The Focus to Say No. Pages 1320.**
- 2. Step 74-Half Life.The Decay of Knowledge and What to Do About It. Pages 1321-1329.**
- 3. Step 75-Power of I do not know. Pages 1330.**
- 4. Step 76-Application. Pages 1331-1340.**
- 5. Step 77-Letting The World Do The Work For You. Pages 1341-1346.**

Part 12: Deep Work and Decision Making.

- 1. Step 78- Slow Down. Pages 1348-1350.**
- 2. Step 79-NOT MULTITASK. Pages 1351.**
- 3. Step 80-You Have Required To Do The Work For Decision Making. Pages 1352-1367.**
- 4. Step 81- Use Rules of Reading for Decision Making 1368-1369.**
- 5. Step 82-Decision Making Books. Pages 1370.**
- 6. Step 83-Decision Making. Pages 1371-1408.**
- 7. Step 84- Thinking, Logic and Mental Model. Pages 1409.**
- 8. Step 85-Letting The World Do The Work For You. Pages 1410-1415.**
- 9. Step 86-Journaling. Pages 1416.**
- 10. Step 87-Letting The World Do The Work For You. Pages 1417-1422.**

Part 13:Deep Work and Communication.

- 1. Step 88- Slow Down. Pages 1424-1426.**
- 2. Step 89-NOT MULTITASK. Pages 1427.**
- 3. Step 90-You Have Required To Do The Work For Communication. Pages 1428-1443.**
- 4. Step 91- Use Rules of Reading For Communication. Pages 1444-1446.**
- 5. Step 92-Communication Books. Pages 1447-1450.**
- 6. Step 93- Thinking, Logic and Mental Model. Pages 1451.**
- 7. Step 94-Letting The World Do The Work For You. Pages 1452-1457.**

Part 14:Deep Work and Teach.

- 1. Step 95- Slow Down. Pages 1459-1461.**
- 2. Step 96-NOT MULTITASK. Pages 1462.**
- 3. Step 97-You Have Required To Do The Work For Teaching. Pages 1463-1478.**
- 4. Step 98- Use Rules of Reading For Teaching. Pages 1479-1481.**

5. Step 99-Teaching Books. Pages 1482-1483.
6. Step 100- Thinking, Logic and Mental Model. Pages 1484.
7. Step 101-Teach. Pages 1485-1486.
8. Step 102-Letting The World Do The Work For You. Pages 1487-1492.

Part 15:Deep Work and Writing.

1. Step 103- Slow Down. Page 1494-1496.
2. Step 104-NOT MULTITASK. Pages 1497.
3. Step 105-You Have Required To Do The Work For Writing. Pages 1498-1513.
4. Step 106- Use Rules of Reading to Analyse The Topic For Writing. Pages 1514-1516.
5. Step 107-Writing Books. Pages 1517-1521.
6. Step 108- How To Become Straight A Student. Pages 1522-1594.
7. Step 109- Thinking, Logic and Mental Model. Pages 1595.
8. Step 110-Letting The World Do The Work For You. Pages 1596-1601.

Part 16:Deep Work, Shallow Work, Strategy and Tactics.

1. Step 111- Slow Down. Page 1603-1605.
2. Step 112-NOT MULTITASK. Pages 1606.
3. Step 113-You Have Required To Do The Work For Strategy and Tactics. Pages 1607-1622.
4. Step 114- Use Rules of Reading to Analyse The Topic For Strategy and Tactics. Pages 1623-1625.
5. Step 115-Strategy and Tactic Books. Pages 1626-1627.
6. Step 116-A Primer on Strategy. Pages 1628-1633.
7. Step 117-Strategy vs. Tactics: Why the Difference Matters. Pages 1634-1637.
8. Step 118-Thinking, Logic and Mental Model. Pages 1638.
9. Step 119- Tiny Gains. Massive Results. Pages 1639-1640.
10. Step 120-Letting The World Do The Work For You. Pages 1641-1646.

Part 17:Leadership And Accountability.

1. Step 121- Slow Down. Pages 1648-1650.
2. Step 122-NOT MULTITASK. Pages 1651.
3. Step 123-The Work Required To Do For Leadership. Pages 1652-1667.

4. Step 124- Use Rules of Reading to Analyse The Topic For Leadership. Pages 1668-1670.
5. Step 125-Leadership and Accountability Books. Pages 1671-1672.
6. Step 126-Thinking, Logic and Mental Model. Pages 1673.
7. Step 127-Leaders and Followers, Planners and Doers. Pages 1674-1676.
8. Step 128-Letting The World Do The Work For You. Pages 1677-1682.

Part 18: Finance, Economics and Investment.

1. Step 129-Investment Books. Pages 1684-1685.
2. Step 130-An Investment Approach That Works. Pages 1686-1687.
3. Step 131-Investing: The Rules of the Road. Pages 1688-1693.
4. Step 132-Use Rules of Reading to Analyse The Topic For Investment. Pages 1694-1696.
5. Step 133-Thinking, Logic and Mental Model. Pages 1697.
6. Step 134-Letting The World Do The Work For You. Pages 1698-1703.

Part 19: Deep Work, Thinking, Logic and Mental Model.

1. Step 135- Slow Down. Pages 1705-1707.
2. Step 136-NOT MULTITASK. Pages 1708.
3. Step 137-You Have Required To Do The Work For Deep Work, Thinking, Logic and Mental Model. Pages 1709-1724.
4. Step 138-Why Critical Thinking, Logic, Thinking and Mental Tools Are Important? Pages 1725-1727.
5. Step 139-Intradisciplinary Thinking. Pages 1728-1768.
6. Step 140-Multidisciplinary Thinking. Pages 1769-1811.
7. Step 141-CrossDisciplinary Thinking. Pages 1812-1854.
8. Step 142-Interdisciplinary Thinking. Pages 1855-1897.
9. Step 143-Transdisciplinary Thinking. Pages 1898-1941.
10. Step 144-Journaling. Pages 1942.
11. Step 145-Letting The World Do The Work For You. Pages 1943-1948.
12. Step 146-Journaling. Pages 1949.
13. Step 147-Letting The World Do The Work For You. Pages 1950-1955.

Part 20:Deep Work and Performance.

- 1. Step 148-Performance Books. Pages 1957.**
- 2. Step 149- Tiny Gains. Massive Results. Pages 1958-1959.**
- 3. Step 150-The Ultimate Deliberate Practice Guide: How to Be the Best. Pages 1960-1980.**
- 4. Step 151-Review, Reflection, Review and Accountability. Pages 1981-1982.**
- 5. Step 152-Improvement. Pages 1983**
- 6. Step 153- Feedback System In Place. Pages 1983.**
- 7. Step 154-Repeat. Pages 1984..**
- 8. Step 155-Letting The World Do The Work For You. Pages 1985-1990.**
- 9. Step 156- Spend 5k-10k Hours On subject to Become Expert. Pages 1991.**

Part 21:Deep Work and Prediction

- 1. Step 157-Prediction Book. Pages 1993.**
- 2. Step 158- Steps In Prediction. Pages 1994-1997.**
- 3. Step 159-You Have Required To Do The Work For Deep Work, Thinking, Logic and Mental Model. Pages 1998-2013.**
- 4. Step 160-Letting The World Do The Work For You. Pages 2014-2019.**

Part 22; Deep Work and Feynman Technique.

- 1. Step 161-Feynman Technique. Pages 2021-2033.**

Part 23:Sport and Jiujitsu, Judo and Wrestling.

- 1. Step 162-What Trainings Do I Do On Daily Basis Pages 2035-2038.**
- 2. Step 163-What Specific Training Do I Want To Practice Today. Pages 2039-2049.**
- 3. Step 164- Letting The World Do The Work For You. Pages 2050-2055.**
- 4. Step 165- Reflection, Review and Improvement. Pages 2056-2057.**

Part 24: Sport and Fighting Sport, Conditioning, Stretching and Flexibility, Strength, Breathing, Mental Tough And Develop Mindset.

- 1. Step 166-Books On Muscle Training. Pages 2059.**
- 2. Step 167-What Trainings Do I Do On Daily Basis Schedule. Pages 2060-2063.**
- 3. Step 168-What Specific Training Do I Want To Practice Today. Pages 2064-2073.**
- 4. Step 169- Letting The World Do The Work For You. Pages 2074-2079.**
- 5. Step 170- Reflection, Review and Improvement. Pages 2080-2081.**

Part 25: Journaling and Review of A Month.

- 1. Step 171-Materials Needed and Listen And Follow Rules of Reading For Journaling and Review of 6 Month And Month. Pages 2083.**
- 2. Step 172-Reflect. Pages 2084.**
- 3. Step 173-Analyse Strength and Weaknesses. Pages 2085.**
- 4. Step 174- Analyse Threats and Opportunities. Pages 2085.**
- 5. Step 175- Improvement. Pages 2085.**
- 6. Step 176- Steps to Take To Do Better and Improve. Pages 2086.**
- 7. Step 177- Ideas and Gratitude. Pages 2086.**

Part 26: Journaling and Review of Week And Day.

- 1. Step 178-Materials Needed and Listen And Follow Rules of Reading For Journaling and Review of The Week. Pages 2088.**
- 2. Step 179-Reflect. Pages 2089.**
- 3. Step 180-Analyse Strength and Weaknesses. Pages 2090.**
- 4. Step 181- Analyse Threats and Opportunities. Pages 2090.**
- 5. Step 182- Improvement. Pages 2090.**
- 6. Step 183- Steps to Take To Do Better and Improve. Pages 2091.**
- 7. Step 184- Ideas and Gratitude. Pages 2091.**

Part 27: Stoic and Stoicism.

- 1. Step 185-You Have Required To Do The Work For Stoic and Stoicism. Pages 2093-2108.**
- 2. Step 186-Decide The Rules of Reading for Stoic and Stoicism. Pages 2109-2111.**
- 3. Step 187- Stoic and Stoicism Books. Pages 2112-2113.**

4. Step 188-Thinking, Logic and Mental Model. Pages 2114.
5. Step 189-Journaling. Pages 2115.
6. Step 190-Letting The World Do The Work For You. Pages 2116-2121.

Part 28: Learning.

1. Step 191-Books For Studies. Pages 2123-2124.
2. Step 192-Classical Education Curriculum. Page 2125-2127.
3. Step 193- UltraLearning Pages 2128-2247.
4. Step 194- How To Be Straight A Student. Pages 2248-2320.

Part 29: Parenting.

1. Step 195-What Should I do As Parent. Pages 2321-2324.
2. Step 196- You have required to Do the Work. Pages 2325-2340.
3. Step 197- Letting the world Do The Work For you. Pages 2341-2346.

Part 30: Sales.

1. Step 198-Books On Sales Pages 2348.
2. Step 199- You have required to Do the Work. Pages 2349-2364.
3. Step 200- Letting the world Do The Work For you. Pages 2365-2370.
4. Step 201-Use Thinking, Logic, Mental Tools, Thinking Tools 2371.

Part 31: Situational Awareness.

1. Step 202-Books On Situational Awareness. Pages 2373.
2. Step 203- You have required to Do the Work. Pages 2374-2389.
3. Step 204- Letting the world Do The Work For you. Pages 2390-2395.
4. Step 205-Use Thinking, Logic, Mental Tools, Thinking Tools 2396.

Part 32: Pareto Principle, Vital Few, Trivial Many or 80/20 Principle.

1. Step 206-80/20 Principle. Pages 2398-2405.

Part 33: Classical Books, Liberal Art and Great Books of Western World

1. Step 207- Great Books Of Western World. Pages 2407-2428.
2. Step 208- Classical Books. Pages 2429-2439.
3. Step 209-How To Get Liberal Arts Education without Degree. Pages 2440-2446.

Part 34:Motivation Quotes

1. Step 210-Motivation Quotes. Pages 2448-2454.

Part 35:Mental Toughness And Focus

1. Step 211-All of David Goggins' Mental Shifts to Reach Full Potential. Pages 2456-2459.
2. Step 212- Kobe Bryant Story. Pages 2460-2463.
3. Step 213- Michael Jordan Story. Pages 2464.
4. Step 214-Tim Grover and Work Ethic. Pages 2465-2481.
5. Step 215- Focus and Books on Focus. Pages 2482.

Part 36:Deep Life, Deep Work and Benjamin Franklin Daily Routine

1. Step 216- Deep Life, Deep Work and Benjamin Franklin Daily Routine. Pages 2484-2591 .
 - I. Documents That Will Stay At Home and Documents That Will Be Brought to Work. Pages 2484-2485.
 - II. Documents That I will Use on Daily and Weekly Basis and Other Times. Pages 2486.
 - III. Stage 0- Core System. Pages 2487-2492.
 - Discipline
 - Values
 - IV. Stage 1- Core Productivity. Pages 2493-2549.
 - Identify End Goals. Page 2493.
 - Quarterly Value Plan. Pages 2494-2495.
 - Quarterly Planning. Pages 2496-2502.
 - Weekly Value Plan. Pages 2503-2504.
 - Weekly Planning. Pages 2505-2517.
 - Daily Planning. Pages 2518-2535.
 - Philosophy. Pages 2536-2548.
 - Periodic Review. Pages 2549.
 - V. Stage 2- What Projects Do I Commit. Pages 2550.
 - VI. Stage 3- How To Fix My Schedule. Pages 2551.
 - VII. Stage 4- Prepare The Environment, Tools and Eliminate Distractions. Pages 2552-2554.

- VIII.Stage 5- Hack Meetings, Phones and Emails and Other Technologies. Pages 2555-2559.
- IX. Stage 6- Understand Importance Of Slow Productivity And Apply Slow Productivity In My Life. Pages 2560-2561.
- X. Stage 7-How To Attack Large Project. Pages 2562.
- XI. Stage 8-Understand The Reward Is Waiting For Me For Doing Deep Work. Pages 2563.
- XII. Stage 9-Preparation Of The Task. Pages 2564.
- XIII.Stage 10- Remind and Understand Law Of Productivity For Deep Work. Pages 2565-2569.
- XIV.Stage 11-Pre Deep Work Routine. Pages 2570.
- XV.Stage 12- Understand About Focus and Hard Focus. Pages 2571.
- XVI.Stage 13- Being Focus Doing Deep Work. Pages 2572-2588.
- XVII.Stage 14-Post Deep Work. Pages 2589-2592.

Part: Books I Could Use

1. Step

*Step 1-Reasons Do and Do Not Read or
Review Generally The News And
Newspaper On Daily Basis.*

1. Reasons Do Read and Review News or Newspaper.

- I. Every Morning and At Any Time Temptation Arises To Read or Review News or Newspaper, Always Read and Listen Rules of Reading Pages 18-19, And Ask Yourself, If I am Going To Read and Review News and Newspaper For The Following GOOD Reasons: Deep Work, Academic Work, Employment, Self Employment, Investigation, Investigative Journalism, Analysis, Reading, Syntopicon, Research and For Various Writings, Thinking, Facts, Data, Mental Model, Critical Thinking, Performance, Make Better Life Decisions. If The Answer is I am NOT Reading or Review News and Newspaper For those GOOD reasons above, Then Do not Read and Review News and Newspaper at All. Any Other Reasons to Read and Review News and Newspaper Leads For Dopamine Increase and Entertainment. I MUST Not Read and Review News and Newspaper For Dopamine and Entertainment, As These Are Bad Reasons.**

2. Reasons Do Not Read Generally The Newspaper On Daily Basis.

- I. The problem is news doesn't make us informed. In fact, the more news we consume the more misinformed we become.**
- II. The speed of news delivery has increased. We used to have to wait to get a newspaper or gossip with people in our town to get news, but not anymore. Thanks to alerts, texts, and other interruptions, the news finds us almost the minute it's published.**
- III. The cost of producing news has dropped significantly. Some people write 12 blog posts a day for major newspapers. It's nearly impossible to write something thoughtful on one topic, let alone 12. The fluency of the person you're getting news from in the subject they're covering is near zero. As a result, you're filling your head with surface-level insights. "When information is cheap, attention becomes expensive." Information is something we are all curious about but how accurately can we predict the future if we fail to understand the past?**
- IV. News doesn't make you more informed; it just makes you more confident the information you have is all there is. News reinforces what we already believe. Rarely do we read things we disagree with, walking away saying, "well that was a good point, I was wrong."**

- V. As news has become easier to distribute and cheaper to produce, the quality has decreased and the quantity has increased.
- VI. The incentives are misaligned. When the news is free, you still need to pay people. If people aren't paying, advertisers are. And if advertisers are in charge, the incentives change. Page views become the name of the game. More page views mean more revenue. When it comes to page views, the more controversy, the more enraged you become, the better.
- VII. We do not to ask ourselves questions about the media we consume: Is this good for me? Is this dense with detailed information? Is this important? Is this going to stand the test of time? Is the person writing someone who is well informed on the issue? Asking those questions makes it clear the news isn't good for you.
- VIII. News producers perpetuate a culture of "tune in, don't miss out, someone knows something you don't, follow this or you'll be misinformed.
- IX. Most of what you read online today is pointless. It's not important to living a good life. It's not going to help you make better decisions. It's not going to help you understand the world. It's not dense with information. It's not going to help you develop deep and meaningful connections with the people around you.
- X. Like a drug, the news is addictive. Not only does it alter your mood, but it keeps you wanting more.
- XI. While platforms like Facebook play a role in our excessive media consumption, we are not innocent. Far from it. We want to be well informed. (More accurately, we want to appear to be well informed.) And this is the very weakness that gets manipulated. "To be completely cured of newspapers, spend a year reading the previous week's newspapers."
- XII. When you stop reading the news the first thing you notice about people who read the news is how misinformed they are. Often, they cherry-pick one piece of information and give it enormous weight in their opinions. Like the dog that didn't bark you realise that they have a tiny lens into a big and messy issue.
- XIII. Another thing you notice is that you weren't as well informed as you thought. The news didn't make your opinions more rational, it just made you more confident you were right. Rarely do we read things we disagree

with. It's much easier to just put our walls up and tune out. Filtering our own news like this self-reinforces what we already believe.

XIV. Another thing you notice is how people who are in the news a lot worry about what the news says about them. Not only does this increase their anxiety but it changes how they think and act. Instead of getting feedback from reality, they crave validation in the printed opinion of others.

XV. Not reading news shows you how often what you thought was your thinking belonged to someone else. **Thinking is hard**. It's much easier to let someone else think for you. Without news in my life, I find that I say "I don't know" more often.

XVI. Instead of the news, we should read good books. More than just read them, we should re-read them.

Step 2 - Reasons Do and Do Not Use Internet.

1. Book For NOT Using Internet and digital media.

- I. Cal Newport Digital Minimisation.

2. Reason Do Use Internet.

- I. **Every Morning and At Any Time Temptation Arises To Use Internet, Always Read and Listen Rules of Reading Pages 20, And Ask Yourself, If I am Going To Use Internet For The Following GOOD Reasons: What is Written in Digital Minimisation By Cal Newport, Deep Work, Academic Work, Employment, Self Employment, Investigation, Investigative Journalism, Analysis, Reading, Syntopicon, Research, For Various Writings, Searching For Books, Articles, Talks, Discussion, Debate, Speeches, Newspaper, Journal, Facts, Data ETC.**
- II. **For Personal: Sport and Sport Analysis, Before or While Driving To Find The Road, Restaurant, Place, Or Any Other Area and Use Google or Google Maps. If The Answer is I am NOT Going To Use Internet For those GOOD reasons above, Then Do not Use Internet at All. Any Other Reasons to To Use Internet Leads For Dopamine Increase and Entertainment. I MUST Not Use Internet For Dopamine and Entertainment, As These Are Bad Reasons.**

3. Reasons Do Not Use Internet.

- I. **Mental Health Issues**-Depression, anxiety and other mental health disorders have risen because the diagnosis methods have improved yes, but also because of isolation and the triggers and stresses. We know that Instagram harms the mental health of young girls.
- II. **The Addictive Internet**-Internet outlets are designed to be addictive. Notifications from Facebook give dopamine rewards for those red numbers, sites are made blue so you trust them more, and yellow so that you are more likely to be generous with your donations.

Step 3-Reasons Do And Do Not Use TV and Youtube, Email And Whatsapp.

1. Reason Do Watch Youtube And TV

- I. **Every Morning and At Any Time Temptation Arises To Use TV and Youtube, Always Read and Listen Rules of Reading Pages 20-21, And Always Ask Yourself, If I am Going To Watch Youtube or TV For Following GOOD Reasons: Deep Work, Employment, Self Employment, Academic Work, Investigation, Investigative Journalism, Improve Skills, Learning, Analysis, Syntopicon, Research, Data, Facts, Academic, Communication, Finance, Professional, Teaching, Sermon, For Various Writing,**
- II. **FOR Personal: Listen Music, Watch With Family Cartoon or Movie and Relax, Strategy, Tactic, Sport, Sport Analysis. If The Answer is I am NOT Going To Use TV and Youtube For those GOOD reasons above, Then Do not Use TV and YOUTUBE at All. Any Other Reasons to To Use TV and Youtube Leads For Dopamine Increase and Entertainment. I MUST Not Use TV And Youtube For Dopamine and Entertainment, As These Are Bad Reasons.**

2. Reasons Do Not Use TV and Youtube.

- I. **It feeds your mind with lies.** A great reason to stop watching television is that it's feeding your mind with lies. Mainstream television is controlled by the corporate elite, which, due to its vested interests, brainwashes TV viewers with false information.
- II. **It makes you feel bad about yourself.** For advertisements to work, they first need to convince you that you are not good enough as you are. For example, in order to persuade you to buy beauty and fashion products, they first need to make you believe that you are ugly and unattractive.
- III. **It's harming your health.** Another obvious yet often unrecognised reason why you'd better stop watching TV is that it's having a negative impact on your health. Indeed, over the last years research has shown that watching TV for even just a

couple of hours every day can significantly increase the chances of obesity, heart disease, and diabetes.

IV. It disconnects you from people. People are social beings with a deep desire to connect and communicate with others. However, being used to spending hours upon hours watching TV, the majority of them sooner or later end up feeling lonely.

3. Check SMS, Email and WhatsApp Twice A day.

I. At Lunch Time and In the Evening.

4. Times To Answer A Call

I. Family (At All Time).

II. Urgent Call (At Any Time).

III. Job (At Any Time During My Working Hours).

IV. Job Interview (Specified Time).

V. For Others Be Very Hard To Reach. They Can Reach Either Call or Email.

5. Every Morning and At Any Time Temptation Arises To Use PC, Ask Yourself What are the reasons to use PC. Below are Good Reasons to Use PC.

I. For Employment, Self Employment, Profesional, Academic, Investigation, Investigative Journalism, Studying, Learning, Deep Study, Deep Work.

II. For Reading, Analysis, Syntopicon, Research, Bible Study, For Various Writing, Journaling, Setting Up Goals, Sport Analysis, Analysis, Teaching, Strategy and Tactics

III. For Check Emails, Letters, Finance and Investment.

IV. For Inserting Sport Techniques and What do I do.

IF I am Not using for Good Reasons, then Do not USE PC at All.

Step 4-NOT MULTITASK.

1. Of course you can do more than one thing at once. The catch is you can't do more than one thing at once that requires concentration. You can walk and chew gum, but you can't write an email and a report at the same time. When you're doing two things at once that are cognitively demanding, what you're really doing is switching back and forth very quickly from one task to another.
2. There is a mental cost—called a switching cost—to all of this multitasking. But that's not all it makes deep thinking impossible.
3. I think people that multitask pay a huge price. They think they're being extra productive, and I think they're (out of their mind). I use the metaphor of the one-legged man in the ass-kicking contest. I think when you multi-task so much, you don't have time to think about anything deeply. You're giving the world an advantage you shouldn't do. Practically everybody is drifting into that mistake. Concentrating hard on something that is important is. I can't succeed at all without doing it. I did not succeed in life by intelligence. I succeeded because I have a long attention span.
4. It sounds counter-intuitive but if you want to increase discretionary time and reduce stress you need to schedule time to think. The tiny fragments of time many of us find ourselves with have a negative effect on our ability to think deeply about a problem. Furthermore they impede our ability to learn — we stay at a surface level and never move into a deep understanding. Deresiewicz warns: "You simply cannot (think) in bursts of 20 seconds at a time, constantly interrupted by Facebook messages or Twitter tweets, or fiddling with your iPod, or watching something on YouTube."
5. The opposite approach is to focus on a problem or subject and try to achieve a deep fluency. How many of us, however, have time? We don't do the work required to have an opinion. Instead we operate with surface knowledge. We tackle problems with the first thought that comes to mind. Because we make a poor initial decision, we spend countless hours attempting to correct it. No wonder we have no time to think. We're not heeding the advice of Joseph Tussman and letting the world do the work for us.
6. Listen and Apply The Following Books:

A. The Myth of Multitasking_ How Doing it All Gets Nothing Done

*Part 2: Steps In Choosing Topic,
Skimming The Books, Articles
Debate, Discussion For Deep Work
Or Deep Study Or Bible Study.*

Step 5 - How To Become Polymath.

1. What Are The Lesson, How To Become Polymath.

A. Lesson 1- Diversify

- I. The winning strategy of polymath is diversification.
- II. Polymath always has several projects on the go.
- III. The successful polymath trying to get range of skills in the areas between fields that they will be able to explore and capitalise on.
- IV. Many polymaths has peers who worked on the same projects and even have rivals.

B. Lesson 2-Be fearless

- I. Polymath are working by themselves despite sometimes extreme resistance and interference from the rest of world.
- II. Many of polymaths have had to push back against ignorance, fear, politics and more.
- III. Polymath is driven by deep inner drive for knowledge, the misunderstanding and disapproval of others is just small impediment.

C. Lesson 3-Seek Authenticity

- I. Polymaths strive for new and unique achievement: fresh visions, novel horizons and totally original combination of ideas.
- II. Polymaths resist easy definition and focus simply on being what they are, following what inspires them and exploring their unique endowment of gifts to the fullest.
- III. Polymath acknowledge mistakes, because the faster they admit they are wrong, the sooner they can find a way to be right.
- IV. Polymath is motivated by curiosity and the will for mastery.

2. Listen, and Apply The Following Books on Polymaths

A. Learn Like like a polymath how to teach yourself anything By Peter Hollins

**B. THE POLYMATH UNLOCKING THE POWER OF HUMAN VERSATILITY By
WAQĀS AHMED**

Step 6-Choose The Topic.

- 1. Read About The Past: If You do not know the Past, then we will tend to Repeat The Same Mistakes.**
- 2. Decide the reason of wanting to read:**
 - A. Reading to Entertain — The level of reading taught in our elementary schools.**
 - B. Reading to Inform — A superficial read. You skim, dive in and out, get a feel for the book, and get the gist of things.**
 - C. Reading to Understand— The real workhorse of reading. This is a thorough reading where you chew on things and digest them.**
 - D. Reading to Master — If you just read one book on a topic, odds are you have a lot of blind spots in your knowledge. Synoptical reading is reading various books and articles on the same topic, finding and evaluating the contradictions, and forming an opinion.**
- 3. List of Ideas, Problems, Historical Events, Inventions, Inventors, Historical People, Great Problems and Topics.**
 - A. Academic Fields.**
 - I. Humanities.**
 - Performance Arts.
 - Visual Arts.
 - History.
 - Languages and Literature.
 - Law.
 - Philosophy.
 - Religious Studies.
 - Theology.
 - II. Social Science.**
 - Anthropology.
 - Archeology.
 - Economics.
 - Geography.

- **Political Science.**
- **Psychology.**
- **Sociology.**
- **Social Work.**

III. Natural Science.

- **Biology.**
- **Chemistry.**
- **Earth Science.**
- **Astronomy.**
- **Physics.**

IV. Formal Science.

- **Computer Science.**
- **Mathematics.**

V. Applied Science.

- **Agriculture.**
- **Architecture and Design.**
- **Business.**
- **Divinity.**
- **Education.**
- **Engineering and Technology.**
- **Environmental studies and forestry.**
- **Family and Consumer Science.**
- **Human Physical performance and recreation.**
- **Journalism, media studies and communication.**
- **Law.**
- **Library and Museum Studies.**
- **Medicine and Health.**
- **Military Science.**
- **Public Administration.**
- **Social Work.**
- **Transportation.**

- B. Syntopicon Part 1 and Part 2**
- C. Great Conversation**
- D. Great Problems and how to solve them in my Working Industry.**
- E. Great Inventions.**
- F. Character Quality.**
- G. Thematic**
- H. Topics**
- I. Words**
- J. Great Inventors.**
- K. Great Thinkers**
- L. Great Philosophers**
- M. Great Problems in History.**
- N. Great Events in History.**
- O. Great People in History.**
- P. Great Ideas.**
 - I. Truth.**
 - II. Goodness.**
 - III. Beauty.**
 - IV. Liberty.**
 - V. Equality.**
 - VI. Justice.**
 - VII. ANGEL.**
 - VIII. ANIMAL.**
 - IX. ARISTOCRACY.**
 - X. ART.**
 - XI. ASTRONOMY AND COSMOLOGY.**
 - XII. BEING.**
 - XIII. CAUSE.**
 - XIV. CHANCE.**
 - XV. CITIZEN.**
 - XVI. CONSTITUTION.**
 - XVII. COURAGE.**
 - XVIII. CUSTOM AND CONVENTION.**
 - XIX. DEFINITION.**
 - XX. DEMOCRACY.**

XXI.DESIRE.
XXII.DIALECTIC.
XXIII.DUTY.
XXIV.EDUCATION.
XXV.ELEMENT.
XXVI.EMOTION.
XXVII.EQUALITY.
XXVIII.ETERNITY.
XXIX.EVOLUTION.

CVI.WISDOM.

4. Books on the Ideas, Problems, Historical Events, Inventions, Inventors, Historical People, Great Problems and Topics.

- I. The Great Ideas: A Syntopicon of Great Books of Western World part 1
By Mortimer Adler.**
- II. The Great Ideas: A Syntopicon of Great Books of Western World part 2
By Mortimer Adler.**
- III. Great Thinkers, Great Ideas By Vincent J Falcone.**
- IV. The Oxford Companion to English Literature.**
- V. Treasury Scripture Knowledge.**

5. Pick Different Areas To Achieve.

- I. Pick a minimum of Three Ideas, Problems, Historical Events, Inventions, Inventors, Historical People, Great Problems and Topics, or skills that are sufficiently distinct from each other. Do not choose subset of the same subject.**
- II. Instead choose combination which are different and distinct and even better if these have some relevance to your work.**

6. Decide Any Topics, Problem or Courses I Will Study Academically, Self Learning and Autodidactic or Deep Work.

I. Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.

II. Brainstorm Idea, Topics and Problems.

A. What Ideas, Problems, Historical Events, Inventions, Inventors, Historical People, Great Problems and Topics Do I want To Study?

B. Do I want to study the topic related to my Job, Hobby and Interest?

C. Do I want To Study Newest Topic, Problem or The topic which stood the test of time?

D. Make A list of Ideas, Problems, Historical Events, Inventions, Inventors, Historical People, Great Problems and Topics that I am Interested.

III. Select A Topic or Course.

A. Pick Ideas, Problems, Historical Events, Inventions, Inventors, Historical People, Great Problems and Topics. I am interested in at the moment.

B. Choose a problem or topic above yourself which are challenging.

- Choose your topics carefully: Not everything that you study suits this technique. Usually abstract complex ideas are best understood by Feynman technique but ideas that are evidence-based or observational might not really be suited for this.

C. Why should I solve this problem? (give positives).

D. Why should I solve this problem? (give negatives, what would happen if I would not solve this problem?).

E. Define the topic or problem?

F. Read Great Books of Western World, and Reflect on the current world and Move Forward.

G. Read About The Past: If You do not know the Past, then we will tend to Repeat The Same Mistakes.

7. Write What I Do Know About the Topic or Problem and What I Do Not Know.

- I. Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.
- II. Selecting a concept to study compels you to be intentional about. what you know, what you don't know and what You think You know. It also forces you to choose a topic that's small enough that it could reasonably fit onto one or several pages.
 - A. Before you start reading a new book, take out a blank sheet of paper. Write down what you know about the book/subject you're about to read — a mind map.

B. **Circle Of Competence**-Understanding my Circle of Competence helps to avoid problems, identify opportunities for improvement and learn from Others. Circle of Competence is simple: Each of us, through experience or study, has built up useful knowledge on certain areas of the world. Some areas are understood by most of us, while some areas require a lot more specialty to evaluate. For example, most of us have a basic understanding of the economics of a restaurant: You rent or buy space, spend money to outfit the place and then hire employees to seat, serve, cook, and clean. (And, if you don't want to do it yourself, manage.) From there, it's a matter of generating enough traffic and setting the appropriate prices to generate a profit on the food and drinks you serve—after all of your operating expenses have been paid. Though the cuisine, atmosphere, and price points will vary by restaurant, they all have to follow the same economic formula. That basic knowledge, along with some understanding of accounting and a little bit of study, would enable one to evaluate and invest in any number of restaurants and restaurant chains, public or private. It's not all that complicated. Far more important is to honestly define what we do know and stick to those areas. Our circle of competence can be widened, but only slowly and over time. Mistakes are most often made when straying from this discipline. Where should we devote our limited time in life, to achieve the most success? So, the simple takeaway here is clear. If you want to improve your odds of success in life and business, then define the perimeter of your circle of competence, and operate inside. Over time, work to expand that circle but never fool yourself about where it stands today, and never be afraid to say "I don't know."

- C. **You face what you don't know.** By writing a topic down on a blank page, you acknowledge you're starting from scratch or at least filling in some blanks. In doing so, take the initial step in the process.
- D. **You need to be specific.** Given the accumulated knowledge in the universe, most of us know nothing about most things! Writing down explicitly what you don't know provides you with a starting point.

III. Write Down General Facts About The Topic That I Know.

IV. Identify and define the current assumptions on topic or problem.

- V. Write Down What Would I like To Learn About The Subject.**
- VI. Identify where you are reasoning from analogy.**
- VII. Break Down the problem into its fundamental principles.**
- VIII. How am I going to conduct research?**
- IX. Who else has same problem, and solved the problem.**
- X. Have they written a book about this topic?**
- XI. Have they recommended any books related to this topic?**
- XII. Have they recommended a of book related to this topic?**
- XIII. Build your foundation. The key here is brutal honesty with yourself about
What we really know about the Topic.**
- XIV. Understanding the basics allows us to predict what matters. Put simply,
people who understand the basics are better at understanding the
Consequences.**
- XV. This helps to find out what exactly we do know and do not know about
the topic.**
- XVI. Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time
and Do Not Rush Process.**

8. Analyse Current Skills and Experience.

- I. Analyse current skills, experiences and interests to spot gaps in
knowledge.**
- II. Where are you lacking compared to your future self?**
- III. What do you already know and do well?**
- IV. What do you still need to learn?**
- V. Can other people fill in these gaps of knowledge?**
- VI. Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and
Do Not Rush Process.**

Step 7-Questions to Ask Yourself Before Saying YES to a New Commitment AND What Type of Mindset To Have.

1. Everyone wants a part of your time. The problem is we don't really understand the nature of time. And so we waste it. We can learn to better harmonise our time across the things that we want. One of the ways to do that is to avoid things that are unproductive.
2. We need to learn that the most powerful productivity tool ever invented is simply the word "no." And you can say no with grace. But how do we know when we should say yes and when we should say no?
3. Ask yourself three simple questions before you accept any new commitment.
 - I. Am I the right person?
 - II. Is this the right time?
 - III. Do I have enough information?
 - IV. If the answer to any of those questions is no, then don't do it.
4. What Type of Mindset To Have, When Starting To Read, Analyse, Syntopicon, Research, Listen, Communication, Performance, DEEP WORK, Bible Study, Investigative Journalism, Investigation And Mixed Method.
 - I. Be attentive to Detailed Focus, and review information few times to ensure the information I providing are correct and True.
 - II. Be analytical mindset, and analyse information and Situation to smallest details.
 - III. Be curious mindset
 - IV. Be working at natural pace, this helps to ensure that information provided are correct and well analysed.
 - V. Have learning mindset, and enjoy learning new things, this helps me to grow.
 - VI. Be Problem Solving Mindset
 - VII.Be growing mindset.

Step 8-What Tools I Will Use For Learning?

1. The Broad Overview.

- I. Look at the ***What to use in different situation***, and find out what tools will I use for learning.
- II. Find Overall Broad Overview of the Topic.
- III. What are the essential details we need to know before attempting to master it?
- IV. What does this topic or skill truly entail?
- V. How extensive is the subject?
- VI. Taken big topic cut it down to pieces and decided which piece we like best
 - Coding as broad subject, we divided into specific languages and agreed upon one or a few languages to learn.
 - Focus on one or two offers us much bigger and higher chance of success.
- VII. Our goal is to infer the appropriate scope for our topic such that it takes from few weeks to a month to grasp.
- VIII. Determine appropriate scope that can be learned within a practical timeframe.
This time period must also be carefully chosen to maximise focus on task.
- IX. Follow your own method of breaking down subjects into small parts. You are organise information for your own specific goals, not based on how others have done it.
- X. Condemnation before investigation. Set Aside Whatever you been taught and believe about topic and look with fresh eyes and try to hear what text is saying.
- XI. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.**

Step 9 - Narrow Down Subject or Topic.

1. Narrow Down.

- I. Narrow down your subject, but this one is restricted to understand enough about the topic to discuss intelligibly and found out for yourself what the true scope is.
 - What is it about?
 - Is the topic something basic that a layperson could grasp in few hours or is it too complex like physics for an untrained individual to pursue?
 - How much literature has been devoted to this subject?
 - How much do you need to learn to understand the topic adequately?
- II. What are Basics, Foundation and Fundamental of the Craft or Topic.
 - Without Basics, Foundation and Fundamentals, You cannot Progress.
- III. What Do I need For Fundamental, Foundation and Basic?
- IV. You don't need to understand the latest study in biology, but you sure as heck better understand the concept of evolution because it applies to so much more than animals.
- V. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.**

2. Define Success.

- I. Look at the ***What to use in different situation***, and find out what tools will I use for learning.
- II. We need to design an objective, measurable criteria for success so that we can know whether we have fulfilled it to a mathematical certainty.
- III. The best way to effectively complete this step is to consider why you intended to learn your chosen subject at all.
- IV. Is there a particular task or function that you would like to be able to perform through learning your chosen subject?
 - E.g Digital photography-the goal of learning digital photography and criteria of using manual modes along with manipulating lighting are both sound.
 - To master digital photography completely, you would have to learn about all of its various subtopics and depending on your motivation for studying, it might be gratifying to achieve that outcome through learning experience.

- V. Ideally the goal should be to learn something that is practically beneficial since using your new skills will reinforce your entire learning process, making easier for you to retain the knowledge.

Step 10 - Information overload: Why we're facing it and how to handle it.

1. It's learning how to search out, consume, and filter it in the best way possible.

- I. There's nothing wrong with having a healthy thirst for current events. The problem is that our news sources have turned from a water fountain to a firehose and propaganda.
- II. Instead of making a choice and feeling good about it, we end up in a constant state of FOMO, stressing that we've made the wrong decision and searching for something better.
- III. "You have to choose what you consume consciously... The information you allow yourself to process affects you greatly. You can become confused quickly with all of the conflicting voices, opinions, and options in the world today."

2. How not to be overloaded with Information

- I. Choose "Just in time" over "Just in case" information. There's a difference between searching out information because you need it now versus just storing it for later.
- II. "Think about the last technical topic you learned from either a class or a book. How much of the details do you remember? The answer probably depends a lot on whether you knew that you needed to be able to do that particular thing you were learning. And that's huge. "Because if even at a high level you know you need to learn PHP, if the parts your studying don't seem directly related to what you know you want to do, the learning will be weak." Think about how you can apply this technique to your information consumption. Rather than read every news story just in case it comes up in conversation, seek out only what you need now. This doesn't mean that you should forgo any information that doesn't have an immediate purpose. But simply to use this as a filter when you're feeling the effects of information overload.

- III. Slow the news cycle by choosing a trusted source and signing up for their newsletter.**
- IV. Rather than get caught up in the “breaking” part of news where facts are more uncertain, slow news is the idea of a longer news cycle that focuses more on fact-checking and careful reporting than being first to report on a story. Gillmor’s gone so far as to cut down on news-based RSS feeds, stop checking Twitter, and even deleted his browser bookmarks to news sites. As he explains: “The more current the news is, the more skeptical I am of what I’m seeing.” Instead, he gets his “slow news” from mailing lists where experts send out links to information they believe is useful and important.**
- V. If you’re feeling the effects of information overload, you can always take a break. Wikipedia never prompts you to go take a break. While YouTube and Netflix purposefully push you to consume more and more. Instead, it’s up to us to become better content and information consumers. We should all schedule breaks into our day, set hard limits on when and how much information we consume, and keep our digital and physical spaces clutter free and well organised.**

Step 11-Compile Resources And Create Curriculum.

1. Compiling Resources.

- I. Look at the ***What to use in different situation***, and find out what tools will I use for learning.
- II. We need to do is compile every recourse we can find on our topic without filtering them. Given the plurality and different mediums used for sharing information. It is advisable to give your method of compilation some lengthy consideration to help you think out of the box.
- III. Find the appropriate books, but consider other mediums like blogs, courses, through friends, find expert, podcasts, magazines, journals, articles, newspapers.
- IV. Read Great Books Of Western World or Classical Books.
- V. Maximise the Number of good resources at your disposal on the topic.
- VI. Create a folder for bookmarks on the topic with relevant resources.
- VII. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.**

2. Create A Curriculum.

- I. Look at the ***What to use in different situation***, and find out what tools will I use for learning.
- II. Create a learning plan for the subject. This is creating an outline what you want to learn.
- III. The Subtopic you have chosen, break down into smaller parts.
 - Review and Analyse table of contents in the books, videos, blogs that you chosen.
 - This can help you to see the structure and even see how everything begins to coverage and overlap. Observe different authors have break down the topic. If all the authors break down similar way the topic, then you should follow same learning plan.
 - Based on the different authors, you can also get the sense of which perspective on the topic are less frequently included.

Step 12-Filter Resources.

1. Filter Resources.

- I. Look at the ***What to use in different situation***, and find out what tools will I use for learning.
- II. **As Learner, if I am going to search for the resources online, does Search Engines put me in the Filter Bubble?**
 - A. **We're increasingly trapped inside an algorithm that filters our news based on what it thinks is best for us.**
 - B. **Computers and the algorithms they run are increasingly aware of the things we seem to like. They learn from what we click on and tailor results so we get more of what we like and less of what we don't like.**
 - C. If Google knows that I'm a democrat or republican they *could* now add a filter to my news to show me only the stories I'm predisposed to agree with. Based on their guess as to my education level, they may then tailor the article's words and language to maximise its impact on me. In this world, I only see things I agree with and writing that I easily comprehend and that's a problem
- III. As Learner, there are number of resources available on any given topic, but we simply don't have the time to pursue them all.
- IV. Attempt to read every book, blogpost or article on single topic bound to result in failure.
- V. Filter resources. The primary goal at this point is to prune (cut) our collection of resources to preserve only the best and avoid overwhelmed by all the material we have collected.
- VI. This helps financially, since you won't need to purchase ten different books to learn about topic.
- VII. The most important part of this step is to carefully and efficiently scan through your resources to select the best ones among them.
- VIII. The entire purpose of selecting these particular resources is for you to learn a specific topic that you choose earlier, not to take all information you have gathered.
- IX. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.**

*Step 13-Choose A Book, Article, Talk,
Discussion, Debate, Speeches, Research,
Newspaper, Journal And Give The Reason
of The Choice*

1. **Study Foundation and Start the Beginning Of The Topic.** Get back to basics. Understanding the basics, as boring as it sounds, is one of the key elements of effective thinking. A lot of people assume the basics are not important and never really take the time to learn them, preferring the sexiness of complexity. Understanding a simple idea deeply, however, creates more lasting knowledge and builds a solid foundation for complex ideas later. The more basic knowledge you have ... the less new knowledge you have to get. Build your foundation. The key here is brutal honesty with yourself about what you really know. Take the time to do a Feynman One Pager on an idea you think you know really well. While easy, this process will reveal any gaps you have in your knowledge. The multidisciplinary mind understands the basic ideas. Acquiring the basic mental models from multiple disciplines allows you to see things that other people can't. You don't need to understand the latest study in biology, but you sure as heck better understand the concept of evolution because it applies to so much more than animals. Understanding the basics allows us to predict what matters. Put simply, people who understand the basics are better at understanding second and subsequent order consequences. Plus, how are we to have a chance of understanding complex ideas without a firm understanding of the basics. Remember, the slightest wind blows over a house without a foundation.
2. **Find Who is Leading Figure On That Topic.**
3. **Let Time Filter Books.** What has been will continue to be. The second idea is the Lindy Effect, which is just a fancy way of saying what's been around will continue to be around. The nonperishable is anything that does not have organic or avoidable expiration dates. Time can predict value. While produce and humans have a mathematical life expectancy that decreases with each day, some things, like books, increase in life expectancy with each passing day.

4. This is where the art of not reading comes in. We have a choice, even if we refuse to exercise it. Schopenhauer offers us guidance on what to read. Remember rather that the man who writes for fools always finds a large public: and only read for a limited and definite time exclusively the words of great minds, those who surpass other men of all time and countries, and whom the voice of fame points to as such. These alone really educate and instruct.
5. Furthering this notion, he adds: One can never read too little of bad or too much of good books: bad books are intellectual poison; they destroy the mind. Which can equally apply to the websites and articles that consume us. Before we know it, we develop a Pot-Belly of Ignorance.
6. Inverting the problem, Schopenhauer suggests, “in order to read what is good, one must make it a condition never to read what is bad; for life is short, and both time and strength limited.” It is because people will only read what is the newest instead of what is the best of all ages, that writers remain in the narrow circle of prevailing ideas, and that the age sinks deeper and deeper in its own mire.
7. Understanding Time-Tested Ideas. So let’s combine these ideas and focus on reading basic ideas that have stood the test of time as a means to understanding them better. Knowledge has a half-life. The most useful knowledge is a broad-based multidisciplinary education of the basics. These ideas are ones that have lasted, and thus will last, for a long time. And by last, I mean mathematical expectation; I know what will happen in general but not each individual case.

8. To Find Book, Article, Talk, Discussion, Debate, Speeches, Research, Newspaper and Journal, Use the Following Books

- I. Great Books of the Western World Part 1: By Mortimer Adler.
- II. Great Books of the Western World Part 1: By Mortimer Adler.
- III. The CBPC Reference Library Catalogue.
- IV. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 1.
- V. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 2.
- VI. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 3.
- VII. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 4.
- VIII. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 5.
- IX. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 6.
- X. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 7.
- XI. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 8.
- XII. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 9.
- XIII. An Index to English Periodical Literature on the Old Testament and Ancient Near Vol 10.
- XIV. Google.
- XV. Library.
- XVI. Google Scholar.
- XVII. internet.

9. Choose A Book, Article, Talk, Discussion, Debate, Speeches, Research, Newspaper, Journal And Give The Reason of The Choice.

- I. It turns out that most of the time the best way to improve your Reading Return on Invested Time (RROIT) is to carefully filter the books you read.
- II. Create a tentative bibliography of your subject by recourse to library catalogues, advisors, and bibliographies in books.
- III. Inspect *all* of the Books, Articles, Talk, Discussion, Debates, Speeches, Research, Newspaper on the tentative bibliography to ascertain which are germane to your subject, and also to acquire a clearer idea of the subject.
- IV. Do not choose the Books, Articles, Talk, Discussion, Debates, Speeches, Research, Newspaper which has idea have not stood the test of time.
- V. Choose Books, Articles, Talk, Discussion, Debates, Speeches, Research, Newspaper on Topic that Time was Tested and withstand the scrutiny.
- VI. Return on Investment on reading and understanding a concept from 500 years ago is highly likely to be exponentially greater in the long run than one presented only 5 years ago.
- VII. Read Great Books of Western World, and Reflect on the current world and Move Forward.
- VIII. If you must read the news, read it for the facts and the data, not the opinions.

10. Ask Questions, Why I Will Use This Book, Articles, Talk, Discussion, Debates, Speeches, Research, Newspaper.

- I. What is the reason I'm choosing this Book, Article, Talk, Discussion, Debate, Speeches, Researches, Newspaper and Journal on the topic?
- II. Why do I think this book will be helpful or good on this topic?
- III. Decide the reason I will Listen, read, research this Book, Article, Talk Discussion, Debate, Speeches, Researches, Newspaper and Journal on the topic?
- IV. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.**

11. There are few type of reading:

- Read for Entertainment
- Read for Information
- Read for Understanding and Learning

Step 14 - My Philosophy

1. When it comes to reading, you don't need to finish what you start. You can quit. Once you realize that you can quit without guilt, everything changes.
2. Reading a great book twice is better than reading ten average ones. All the time you spend reading something bad comes at the expense of reading something good.
3. My philosophy with reading is simple:
 - I. Skim a lot of books.
 - II. Read a few that deserve undivided attention.
 - III. Immediately re-read the best ones twice.

Step 15-Intelligently Skimming Through The Book. VERY VERY FAST READING AND SKIMMING.

1. Intelligently Skimming Through The Book.

- I. Doing the Intelligently Skimming: Book, Text, Discussion, Talk, Speech, Communication, Research, Writing, Preach, Debate, Public Speaking.
- II. Should take approximately 1-3 hours.
- III. Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.
- IV. Intelligently Skimming.
- V. Decide, if this is worth to Pursue Further, Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method.

VERY VERY FAST READING AND Systematic Skimming or Pre-Reading.

Inspectional Reading I: Systematic Skimming or Pre-reading

1. **LOOK AT THE TITLE PAGE AND, IF THE Source HAS ONE, AT ITS PREFACE.**
Read each quickly. Note especially the subtitles or other indications of the scope or aim of the book or of the author's special angle on his subject. Before completing this step you should have a good idea of the subject, and, if you wish, you may pause for a moment to place the book in the appropriate category in your mind. What pigeonhole that already contains other books does this one belong in?
2. **STUDY THE TABLE OF CONTENTS** to obtain a general sense of the book's structure; use it as you would a road map before taking a trip. It is astonishing how many people never even glance at a book's table of contents unless they wish to look something up in it. In fact, many authors spend a considerable amount of time in creating the table of

contents, and it is sad to think their efforts are often wasted. It used to be a common practice, especially in expository works, but sometimes even in novels and poems, to write very full tables of contents, with the chapters or parts broken down into many subtitles indicative of the topics covered. Milton, for example, wrote more or less lengthy headings, or “Arguments,” as he called them, for each book of *Paradise Lost*. Gibbon published his *Decline and Fall of the Roman Empire* with an extensive analytical table of contents for each chapter. Such summaries are no longer common, although occasionally you do still come across an analytical table of contents. One reason for the decline of the practice may be that people are not so likely to read tables of contents as they once were. Also, publishers have come to feel that a less revealing table of contents is more seductive than a completely frank and open one. Readers, they feel, will be attracted to a book with more or less mysterious chapter titles—they will want to read the book to find out what the chapters are about. Even so, a table of contents can be valuable, and you should read it carefully before going on to the rest of the book. At this point, you might turn back to the table of contents of this book, if you have not already read it. We tried to make it as full and informative as we could. Examining it should give you a good idea of what we are trying to do.

3. **Understand the language of the Resource.** This means skimming the index. Not only will this give you an idea for the range of topics covered but it will also tell you the other people the book connects to and the jargon used in the book.
4. **CHECK THE INDEX** if the book has one—most expository works do. Make a quick estimate of the range of topics covered and of the kinds of books and authors referred to. When you see terms listed that seem crucial, look up at least some of the passages cited. (We will have much more to say about crucial terms in Part Two. Here you must make your judgment of their importance on the basis of your general sense of the book, as obtained from steps 1 and 2.) The passages you read may contain the crux—the point on which the book hinges —or the new departure which is the key to the author’s approach and attitude. As in the case of the table of contents, you might at this point check the index of this book. You will recognise as crucial some terms that have already been discussed. Can you identify, for example, by the number of references under them, any others that also seem important?

5. **If the Source is a new one with a dust jacket, READ THE PUBLISHER'S BLURB.**

Some people have the impression that the blurb is never anything but sheer puffery. But this is quite often not true, especially in the case of expository works. The blurbs of many of these books are written by the authors themselves, admittedly with the help of the publisher's public relations department. It is not uncommon for authors to try to summarise as accurately as they can the main points in their book. These efforts should not go unnoticed. Of course, if the blurb is nothing but a puff for the book, you will ordinarily be able to discover this at a glance. But that in itself can tell you something about the work. Perhaps the book does not say anything of importance—and that is why the blurb does not say anything, either. Upon completing these first four steps you may already have enough information about the book to know that you want to read it more carefully, or that you do not want or need to read it at all. In either case, you may put it aside for the moment. If you do not do so, you are now ready to skim the book, properly speaking.

6. **One reason why titles and prefaces are ignored by many readers is that they do not think it important to classify the Source they are reading.**

They do not follow this first rule of analytical reading. If they tried to follow it, they would be grateful to the author for helping them. Obviously, the author thinks it is important for the reader to know the kind of book he is being given. That is why he goes to the trouble of making it plain in the preface, and usually tries to make his title—or at least his subtitle—descriptive. Thus, Einstein and Infeld, in their preface to *The Evolution of Physics*, tell the reader that they expect him to know “that a scientific book, even though popular, must not be read in the same way as a novel.” They also construct an analytical table of contents to advise the reader in advance of the details of their treatment. In any event, the chapter headings listed in the front serve the purpose of amplifying the significance of the main title.

7. **From your general and still rather vague knowledge of the Source's contents, LOOK NOW AT THE CHAPTERS THAT SEEM TO BE PIVOTAL TO ITS ARGUMENT.**

If these chapters have summary statements in their opening or closing pages, as they often do, read these statements carefully. At this point, you have an overview of the jargon and the journey the author is taking you on. It should be relatively easy to identify the pivotal chapter to the argument. Dive into these reading bits and pieces. How are they structured? How connected is it to the rest of the book?

Is this a place you want to end up? Turn the pages and dive in here and there with a few paragraphs or even pages.

8. **Finally, TURN THE PAGES, DIPPING IN HERE AND THERE, READING A PARAGRAPH OR TWO, SOMETIMES SEVERAL PAGES IN SEQUENCE, NEVER MORE THAN THAT.** Thumb through the book in this way, always looking for signs of the main contention, listening for the basic pulse beat of the matter. Above all, do not fail to read the last two or three pages, or, if these are an epilogue, the last few pages of the main part of the book. Few authors are able to resist the temptation to sum up what they think is new and important about their work in these pages. You do not want to miss this, even though, as sometimes happens, the author himself may be wrong in his judgment.
9. **Read the end.** Authors generally do a good job summarizing their work in the last few pages. This where they sum up what they think is most important about their work.
10. **Listen to an interview.** While this has nothing to do with the actual book, interviews can be a great way to get the gist of a book in 30m or so. Authors do so much promotion now that it's relatively easy to find interviews. And of course, they use the best examples from the book in these interviews.
11. If the book is over your head this is reason to read it, as this helps to improve yourself and forces you to work on the book to understand.
12. There are Books that can be:
 - I. Tasted.
 - II. Swallowed.
 - III. Chew and Digested.
13. **Deciding to Read a Book.**
14. That's how you intelligently skim a book. Once you get some practice, it should take at most, an hour.
15. Skimming helps you reach a decision point: Does this book deserve more of my time and attention? Why?

16. Unless you're reading for entertainment, if you can't answer that question, you can toss the book.
17. Mastering intelligent skimming will:
- Save you a lot of time because most books are not worth reading.
 - Offer knowledge of the book's blueprint and contents so you know where to find stuff if you need it in the future.
 - Improve retention, if you decide to read the book in its entirety because you've primed your brain with the contents.
18. Do I need prerequisite for this book or not? Do I need Some Tools Necessary for Understanding this Book? Or Am I intellectually Lazy for this Book?
19. Do I need to put Enough of Thought and time to this book?
20. Never Read A book Just to Win an Argument, but be open minded for Author's Persuasion and convince.
21. It is not about how many books do you read, it is whether you digest of master thinkers. It is not about quantity, but about quality, like great books of western world or Stoics.
22. Great Writers are very specific about the words they use and how they use them. Great Writers, wrote a sentence that can be commented in a Book. While modern writers write a book that can be sum up in a sentence.
23. Do Not Try to put your thoughts, or what I feel the text could mean or mean to me into, but let the author say what does he mean and says in the text.
24. Some Books You need a Teacher, who Studied The Text to help you through the text.
25. Be informed citizen is read more classical books and history. This unfolds how the real world works and where it is going. If You read Classical Books, then you can well predict what would happen next in the future based on the events happening.
26. Do not read the newest books, but the great books of western world, stoic and classics, as these books stood the test of time.

Step 16- Find Out What Kind of Resource is this?

1. Find Out What Kind of Book, Article, Debate, Discussion, Monologue, Dialogue, Discourse, Video, Newspaper, Newsletter, Letter is this.

- I. Bible Study.**
- II. Theology.**
- III. Poetry.**
- IV. History.**
- V. Theoretical.**
- VI. Practical.**
- VII. Biography.**
- VIII. Autobiography.**
- IX. Current Event.**
- X. Science.**
- XI. Popular Science.**
- XII. Mathematics.**
- XIII. Philosophy.**
- XIV. Canonical.**
- XV. Philosophy.**
- XVI. Social Science.**
- XVII. Stories.**
- XVIII. Plays.**
- XIX. Epic.**
- XX. Tragedy.**
- XXI. Poems.**
- XXII. Lyrics.**
- XXIII. Non-Fiction.**
- XXIV. Syntopicon.**
- XXV. Research.**
- XXVI. Speech.**

XXVII.Video.
XXVIII.Podcast.
XXIX.Dialogue.
XXX.Conversation.
XXXI.Communication.
XXXII.Films.
XXXIII.Debate.
XXXIV.Academic Journals
XXXV.Academic Articles
XXXVI.Documentary.
XXXVII.Conference.

*PART 3: Rules of Reading for
Entertainment and Basic
Understanding For Deep Work, Or
Deep Study, Or Bible Study*

Step 17- Decide The Rules for Entertainment and Basic Understanding.

1. There are few type of reading:

- Read for Entertainment.
- Read for Information.
- Read for Understanding and Learning.

2. Decide The Rules for Basic Understanding.

A. VERY FAST READING- Entertainment.

- I. Method 1-Speed Reading. VERY FAST Reading. Pages 59-64.**

B. FAST READING: Methods for Basic Knowledge For Deep Work or Bible Study.

- I. Method 1-Survey, Question, Read, Recite, Record, Reflect (SQR4). Pages 66-67.**
- II. Method 2-Use 80/20 Principle For Reading. Pages 68.**
- III. Method 3-Preview, Question, Read, Summary,Test (PQRST). Page 69.**
- IV. Method 4-Flip Through Pages and Analyse. Page 70.**
- V. Method 5-Devotional Bible Study by Using Devotional Books. Pages 71-72.**
- VI. Method 6-Devotional Bible Read. Pages 73-74.**

Step 18-Dive In.

1. Dive In.

- I. In this step, you would need to learn enough about the topic or module to then grasp it more extensively. This means you need to find basic information before attempting to learn it in further depth.
- II. In this step it is simply to gain a basic familiarity with a particular module so that you can explore it independently.
- III. Spend minimal amount of time on this step.
- IV. Familiarise with concept of the topic.
- V. Make notes of the concept that seems to be most relevant to my module.
- VI. My goal is to only understand the basics, so that I am prepared for the next step.
- VII. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.**

Step 19 - The Best Way to Find More Time to Read

How do you find the time to read so much?" or "how can I find more time to read?"

Let me share with you how I find time to read, learn, and give myself an advantage.

Everyone looks at my reading list and assumes that I either have no life or speed-read.

When I tell people that I do have a life and I don't speed-read, the question becomes:

what's your secret? How do you find more time to read than the average person?

Well, first, there is no secret. As simple as it sounds, finding time to read boils down to choices about how you allocate your time. And allocating your time is how successful people increase productivity.

In a good week, I can read three to five books. Sometimes fewer. I'm an average reader, likely within one standard deviation in terms of speed and retention. In short, I'm no different from you when it comes to how fast I read.

For example, while remarkably enjoyable, *Blood and Beauty* consumed almost a week. I was incredibly slow reading *Seneca's Epistles 1-65*, and even slower with *Antifragile*.

These are books I don't want to rush. On the other hand, I can cruise through something like *Fate of the States* in an afternoon.

When reading, I generally take notes. I'm underlining, synthesizing, asking questions, and relating concepts from other things I've read.

After I finish a book, I let it age for a week or two and then pick it up again. I look at my notes and the sections I've marked as important. I write them down. Or I let the book age for another week or two.

Finding More Time to Read

Let's look at this another way. Rather than say what I do, I'll tell you what I don't do.

What gets in the way of reading?

I don't spend a lot of time watching TV. (The lone exception to this is during football season, when I watch one game a week.)

I watch very few movies.

I don't spend a lot of time commuting.

I don't spend a lot of time shopping.

These choices are deliberate. I don't even have cable TV. I watch NFL through Game Pass, which also saves time (if you don't watch games live, you can watch the full game in under 30 minutes).

I live downtown; I can walk to the grocery store, purchase a bagful of groceries, and return home all within 15 minutes.

If you assume that the average person spends 3–4 hours a day watching TV, an hour or more commuting, and another 2–3 hours a week shopping, that's 28 hours a week on the low end.

Twenty-eight hours. That's 1,680 minutes. That's huge. If you read a page a minute, that's more than 1,600 pages a week.

Books Are Important

Few things are as rewarding as making friends with the eminent dead. Reading isn't something to be done once a week to check a box; it's something to do every day.

If you're a knowledge worker, you're paid to use your brain, so it's in your best interest to make that brain as big as possible.

Wherever I go, a book is not far behind. It might be on my phone or physical, but there is always a book close by.

Finding time to read is easier than you might think. Waiting for a bus? Stop staring down the street and read. Waiting for a taxi? Read. On the train? Read. On the plane? Read. Waiting for your flight? Read.

What I read depends on the situation.

If I know I have only a few minutes, I'm not going to read something that requires a lot of mental context switching to get back into. I'll keep it simple, with something like Phil Jackson's *Eleven Rings: The Soul of Success* or *Grow Regardless*. Waiting around is also a great time to read magazines and printed copies of articles from the web. These tend to be short, rather disposable, and easily digested.

Early in the evening, say around 8 or 9, I'll grab a glass of wine and sink into something serious. Something I want to read without interruption. Some nights I'll read well past midnight; other nights I'll stop reading around 10 or 11.

I'll then do a little bit of blogging and plop myself into bed and read till I fall asleep.

Sometimes I'll read something light before going to bed, and sometimes I'll read something requiring more thought so I can ponder an idea while I'm falling asleep.

When I'm not reading, I'm trying to think about what I've just read. I don't pull out a book while I'm in the checkout line at the grocery store. While everyone else is playing the "which line is longer game," I'm toying with something I've read recently.

[quote]Ignorance is more expensive than a book.[/quote]

Investments

The biggest problem with reading so much is money.

Books are expensive. I often joke that the only group I'm in the 1% of is Amazon customers.

After I graduated from university, I made a choice that I've rarely deviated from: I don't worry about any money spent on books. I'm not alone. I know other people do this, too. The first thing I did when I started making money was to call my younger brothers and tell them that until they graduated high school, I'd buy them whatever books they wanted as long as they promised to read them. As many as they wanted; whatever they wanted.

Why Do You Read?

Some people read for entertainment. Some people read to acquire knowledge. Some read for both.

To me, reading is more than a raw input. I read to increase knowledge. I read to find meaning. I read for better understanding of others and myself. I read to discover. I read to make my life better. I read to make fewer mistakes.

To borrow words from David Ogilvy, reading can be "a priceless opportunity to furnish your mind and enrich the quality of your life."

Remember the tagline of this website: *Mastering the best that other people have already figured out*. That'd be nearly impossible without reading. In fact, it is largely through reading that we walk this path.

We've been recording knowledge in books for a long time. That means there's not a lot that's new; it's just recycled old knowledge. Even Nassim Taleb, author of *Antifragile*, points out that several ancient philosophers grasped the concept of antifragility. Odds are that no matter what you're working on, someone somewhere, who is smarter than you, has probably thought about your problem and put it into a book.

In *The Prince*, Machiavelli writes, "A wise man ought always to follow the paths beaten by great men, and to imitate those who have been supreme, so that if his ability does not equal theirs, at least it will savor of it." That's not to say that this is the only way, but why not start with the best thinking that has come before you? Seneca, on the same subject, wrote, "Men who have made these discoveries before us are not our masters, but our guides."

The Library

When I get into detailed discussions on my book buying habits, people often ask why I never use the library. "Think of all the money you'd save," they say.

The truth is, I keep most of the books I read and I go back to them. “If you are OK giving the books back after two weeks,” writes Ryan Holiday, “you might want to examine what you are reading.” I take that one step further: If you’re not keeping what you read, you probably want to think about what you’re reading and how.

While not impossible, it’s harder to have conversations with library books. You can’t pull out a pen and write in the margin. You can’t highlight something. Having conversations with books is one of the ways that I learn.

“The rich invest in time, the poor invest in money.”

— Warren Buffett

If you wanted to look something up again in a library book, you’d have to get in your car and drive back to the library. But how much time have you spent now driving back and forth?

How do you value your time? We can make more money; we can’t make more time.

Charlie Munger, voracious reader, billionaire, and vice chairman of Berkshire Hathaway, once commented: “In my whole life, I have known no wise people (over a broad subject matter area) who didn’t read all the time – none, zero.”

It’s pretty simple: Either you read or you don’t. If you read, you probably want to do it more. If you don’t read, I’m not going to convince you to put down the remote.

Reading more isn’t a secret. It comes down to choices.

Warning: Side effects of reading more may include (1) increased intelligence; (2) an uncomfortable silence when someone asks you what happened on *Game of Thrones* last night and you say “Game of what?”; (3) better ideas; and (4) increased understanding of yourself and others.

So what are you waiting for? Cancel your cable and buy some books. Looking for a place to start?

Step 20 - Just Twenty- Five Pages a Day

- Reading doesn't need to take up all of your time.
- The most effective way to read more is to start with 25 pages a day.
- Twenty-five pages a day is almost 10,000 pages a year.
- The number of pages you read is not as important as the fact that you enjoy it.

I love bookshelves. I love the physical act of having the books on the shelves to be looked at, admired, and remembered.

When I was younger, I really enjoyed the library, and I still do. But I learned over time that for me to *own* a book — intellectually — I needed to *own* the damn book. I needed to have it close by for reference. I needed to be able to write in it and take it down off the shelf and put it back on the shelf and take it down off the shelf and put it back on the — you get it. So I built my Anti-library, and today, even after giving away hundreds of books, my shelves are stocked. I've probably read 1/4 of them. But I keep adding.

It's a classic on power politics in New York in the early to middle 20th century, seen through the eyes of the brilliant and wicked Robert Moses. The glory and curse of the book, though, is that it's a doorstopper. It runs at about 1,110 pages — dense ones. I think Caro said it came to about 700,000 words. (Which was down from his original finished draft of over a *million*.) It's well written, not a slog in any sense of the word, but even great books take time due to sheer volume.

When you think about reading a book like that, even taking it off the shelf seems to generate anxiety. Let's do the math: I'm a pretty good reader, I think I read in the neighborhood of 300 words per minute. It might be plus or minus 50 words, but my guess is that's a close estimate for a text written in modern English prose.

At 300 words per minute, a 700,000-word text will take me 2,333 minutes, or about 39 hours to read. And there's the issue: the brain doesn't seem to like to get started on 39-hour projects it isn't being paid to complete. The gap between where you are and completion is too large. Instead, we pick something shorter and easier. Still counts, right? I thought about all of the *other* great works I wanted to get to in my lifetime. Caro has four (eventually five) books about LBJ that are masterpieces on 20th-century American politics. I want to read Gibbon's Decline and Fall of the Roman Empire. I want to read Tolstoy's Anna Karenina and War and Peace. I want to read Boswell's Johnson.

Shirer's Rise and Fall of the Third Reich. Adam Smith's The Wealth of Nations. More of Ron Chernow's biographies. (Titan is one of my favorites of all time, and I hear great things about Alexander Hamilton.) All doorstoppers.

That got me thinking. How the heck does anyone get these books read? How do I become a person that's *read* all these books rather than talked about them?

We do a lot of reading for Farnam Street, but it's hard to take a week off from our standard fare to sit and read War and Peace. It's the same for any busy person with a profession that takes up their days.

The solution I devised for myself is a simple one: 25 pages a day. That's it. Just commit to that, and then do it. What will 25 pages a day get you?

Let's say that two days out of each month, you probably won't have time to read. Plus Christmas. That gives you 340 days a year of solid reading time. 25 pages a day for 340 days is 8,500 pages. 8,500. What I have also found is that when I commit to a minimum of 25 pages, I almost always read more. So let's call the 8,500 pages 10,000. (I only need to extend that 25 pages into 30 to get there.)

With 10,000 pages a year, at a general pace of 25/day, what can we get done?

Well, The Power Broker is 1,100 pages. The four LBJ books are collectively 3,552 pages. Tolstoy's two masterpieces come in at a combined 2,160. Gibbons is six volumes and runs to about 3,660 pages. That's 10,472 pages.

That means, in about one year, at a modest pace of 25 pages a day, I've knocked out 13 masterful works and learned an enormous amount about the history of the world. In one year!

That leaves 2017 to read Shirer's Rise and Fall (1,280), Carl Sandburg's Six Volumes on Lincoln (2,000?), Adam Smith's Wealth of Nations unabridged (1,200), and Boswell's Johnson (1,300) with plenty of pages left to read something else.

This is how great works get read. Day by day. 25 pages at a time. No excuses.

Before anyone takes this too literally, the point isn't the number. (Although 25 pages is my literal rule.) It could be 20 pages, 10 pages, thirty minutes, an hour, or 2,000 words. Regardless of what unit of reading you choose, the math will still work out: In six months, a year, or five years, you'll have digested a large swath of human wisdom.

Did you ever want to read Moby Dick? Or Ulysses? Or some of Jane Austen's books? Or David Foster Wallace's Infinite Jest? Done! Start today. 25 pages. Then do it tomorrow. Read in the morning, read at lunch, read before bed, read at the dentist's

office...it doesn't matter. Just get your pages in, day in and day out. And then you'll be a person who reads the books everyone else simply talks about.

What you choose to read is up to you. I love history. I love biography. I love science.

Tolstoy aside, I don't read many novels. But the task no longer seems daunting, does it?

All it takes is commitment and a little assiduity. So let's go get smart.

*Step 21-Use The Chosen Rules of
Reading Method For Entertainment Or
Basic Understanding and Follow Each Steps
Of The Method Until Finish All Steps,
And Follow Each Steps As many Times As
I Want, While Re-listen Lectures, Read
Books or Lecture Notes 1-1000 Times For
Each Step. VERY FAST READING.*

VERY Fast Reading For Entertainment-Basic

Level

Method 1-VERY Fast Reading Speed Reading

Inspectional Reading I: Systematic Skimming or Pre-reading.

1 LOOK AT THE TITLE PAGE AND, IF THE BOOK HAS ONE, AT ITS PREFACE. Read each quickly. Note especially the subtitles or other indications of the scope or aim of the book or of the author's special angle on his subject. Before completing this step you should have a good idea of the subject, and, if you wish, you may pause for a moment to place the book in the appropriate category in your mind. What pigeonhole that already contains other books does this one belong in?

2. STUDY THE TABLE OF CONTENTS to obtain a general sense of the book's structure; use it as you would a road map before taking a trip. It is astonishing how many people never even glance at a book's table of contents unless they wish to look something up in it. In fact, many authors spend a considerable amount of time in creating the table of contents, and it is sad to think their efforts are often wasted. It used to be a common practice, especially in expository works, but sometimes even in novels and poems, to write very full tables of contents, with the chapters or parts broken down into many subtitles indicative of the topics covered. Milton, for example, wrote more or less lengthy headings, or "Arguments," as he called them, for each book of *Paradise Lost*. Gibbon published his *Decline and Fall of the Roman Empire* with an extensive analytical table of contents for each chapter. Such summaries are no longer common, although occasionally you do still come across an analytical table of contents. One reason for the decline of the practice may be that people are not so likely to read tables of contents as they once were. Also, publishers have come to feel that a less revealing table of contents is more seductive than a completely frank and open one. Readers, they feel, will be attracted to a book with more or less mysterious chapter titles—they will want to read the book to find out what the chapters are about. Even so, a table of contents can be valuable, and you should read it carefully before going on to the rest of the book. At this point, you might turn back to the table of contents of this book, if you have not already read it. We tried to make it as full and informative as we could. Examining it should give you a good idea of what we are trying to do.

3. CHECK THE INDEX if the book has one—most expository works do. Make a quick estimate of the range of topics covered and of the kinds of books and authors referred to. When you see terms listed that seem crucial, look up at least some of the passages cited. (We will have much more to say about crucial terms in Part Two. Here you must make your judgment of their importance on the basis of your general sense of the book, as obtained from steps 1 and 2.) The passages you read may contain the crux—the point on which the book hinges—or the new departure which is the key to the author's approach and attitude. As in the case of the table of contents, you might at this point check the index of this book. You will recognise as crucial some terms that have already been discussed. Can you identify, for example, by the number of references under them, any others that also seem important?

4. If the book is a new one with a dust jacket, READ THE PUBLISHER'S BLURB. Some people have the impression that the blurb is never anything but sheer puffery. But this is quite often not true, especially in the case of expository works. The blurbs of many of these books are written by the authors themselves, admittedly with the help of the publisher's public relations department. It is not uncommon for authors to try to summarise as accurately as they can the main points in their book. These efforts should not go unnoticed. Of course, if the blurb is nothing but a puff for the book, you will ordinarily be able to discover this at a glance. But that in itself can tell you something about the work. Perhaps the book does not say anything of importance—and that is why the blurb does not say anything, either. Upon completing these first four steps you may already have enough information about the book to know that you want to read it more carefully, or that you do not want or need to read it at all. In either case, you may put it aside for the moment. If you do not do so, you are now ready to skim the book, properly speaking.

5. One reason why titles and prefaces are ignored by many readers is that they do not think it important to classify the book they are reading. They do not follow this first rule of analytical reading. If they tried to follow it, they would be grateful to the author for helping them. Obviously, the author thinks it is important for the reader to know the kind of book he is being given. That is why he goes to the trouble of making it plain in the preface, and usually tries to make his title—or at least his subtitle—descriptive. Thus, Einstein and Infeld, in their preface to *The Evolution of Physics*, tell the reader that they expect him to know "that a scientific book, even though popular, must not be read in the same way as a novel." They also construct an analytical table of contents to advise the reader in advance

of the details of their treatment. In any event, the chapter headings listed in the front serve the purpose of amplifying the significance of the main title.

6. From your general and still rather vague knowledge of the book's contents, LOOK NOW AT THE CHAPTERS THAT SEEM TO BE PIVOTAL TO ITS ARGUMENT. If these chapters have summary statements in their opening or closing pages, as they often do, read these statements carefully.

7. Finally, TURN THE PAGES, DIPPING IN HERE AND THERE, READING A PARAGRAPH OR TWO, SOMETIMES SEVERAL PAGES IN SEQUENCE, NEVER MORE THAN THAT. Thumb through the book in this way, always looking for signs of the main contention, listening for the basic pulse beat of the matter. Above all, do not fail to read the last two or three pages, or, if these are an epilogue, the last few pages of the main part of the book. Few authors are able to resist the temptation to sum up what they think is new and important about their work in these pages. You do not want to miss this, even though, as sometimes happens, the author himself may be wrong in his judgment.

Inspectional Reading II: Superficial Reading

1. Skimming through Audiobook between 190 words per minute to 375 words per minute or between 1.25-2.5 times speed.
2. Normally listen audiobook from beginning to end between 190 words per minute to 285 words per minute or between 1.25-1.9 times speed.
3. Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed.
4. Read or Listen The Full Book Without Stopping.
5. Read or listen 25min and 5min break.
 - Read or Listen 20 pages an Hour according Mortimer Adler.
6. Read or Listen between 1-50 times the book.
7. Speed of Audiobook.
 - Normally listen audiobook from beginning to end between 150 words per minute to 300 words per minute or between 1-2 times speed.
8. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.
9. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem.
10. With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at different speeds—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

Inspectional Reading III: Superficial Reading

1. Read or Listen The Full Book Without Stopping.
2. That rule is simply this: In tackling a difficult book for the first time, read it through without ever stopping to look up or ponder the things you do not understand right away.
3. Pay attention to what you can understand and do not be stopped by what you cannot immediately grasp. Go right on reading past the point where you have difficulties in understanding, and you will soon come to things you do understand. Concentrate on these.

Basic Questions a Reader Asks

1 Understand the language of the book. This means skimming the index. Not only will this give you an idea for the range of topics covered but it will also tell you the other people the book connects to and the jargon used in the book.

2. Identify the pivotal points. At this point, you have an overview of the jargon and the journey the author is taking you on. It should be relatively easy to identify the pivotal chapter to the argument. Dive into these reading bits and pieces. How are they structured? How connected is it to the rest of the book? Is this a place you want to end up? Turn the pages and dive in here and there with a few paragraphs or even pages.

3. WHAT IS THE BOOK ABOUT AS A WHOLE? You must try to discover the leading theme of the book, and how the author develops this theme in an orderly way by subdividing it into its essential subordinate themes or topics.

4. WHAT IS BEING SAID IN DETAIL, AND HOW? You must try to discover the main ideas, assertions, and arguments that constitute the author's particular message.

5. IS THE BOOK TRUE, IN WHOLE OR PART? You cannot answer this question until you have answered the first two. You have to know what is being said before you can decide whether it is true or not. When you understand a book, however, you are obligated, if you are reading seriously, to make up your own mind. Knowing the author's mind is not enough.

6. **WHAT OF IT?** If the book has given you information, you must ask about its significance. Why does the author think it is important to know these things? Is it important to you to know them? And if the book has not only informed you, but also enlightened you, it is necessary to seek further enlightenment by asking what else follows, what is further implied or suggested.

7. What is the structure, or blueprint, of the book “whereby the author develops his conception or understanding of that general subject matter?”

8. Always Have doubt about everything, and always. Do not be afraid to ask questions About Everything. Ask Questions:

- Who?
- What?
- When?
- Where?
- Why?
- How?

8. **Listen to an interview.** While this has nothing to do with the actual book, interviews can be a great way to get the gist of a book in 30m or so. Authors do so much promotion now that it's relatively easy to find interviews. And of course, they use the best examples from the book in these interviews.

*FAST READING Methods for Basic
Knowledge*

Method 1-Survey, Question, Read, Recite, Record,

Reflect (SQR4)

SQR4

- I. Condemnation before investigation. Set Aside Whatever you been taught and believe about topic and look with fresh eyes and try to hear what text is saying.
- II. Survey - Review the chapter before read or listen. The first step, survey or **skim**, advises that one should resist the temptation to read the book and instead first go through a chapter and note the headings, sub-headings and other outstanding features, such as figures, tables, marginal information, and summary paragraphs. This survey step typically only takes 3–5 minutes, but it provides an outline or framework for what will be presented. The reader should identify ideas and formulate questions about the content of the chapter.
- III. Questions-**Generate questions** about the content of the reading. For example, convert headings and sub-headings into questions, and then look for answers in the content of the text. Other more general questions may also be formulated:
 - What is this chapter about?
 - What question is this chapter trying to answer?
 - How does this information help me?
- IV. Always Have doubt about everything, and always. Do not be afraid to ask questions About Everything. Ask Questions:
 - Who?
 - What?
 - When?
 - Where?
 - Why?
 - How?
- V. Read or Listen-Use the background work done with "S" and "Q" in order to begin reading actively. This means reading in order to answer the questions

raised under "Q". Passive reading, in contrast, results in merely reading without engaging with the study material.

VI. Recite-The second "R" refers to the part known as "Retrieve." The reader should try to retrieve from memory what was learned in the same manner as telling someone else about the information. It is important that the reader use his/her own words in order to formulate and conceptualise the material. Try recalling and identifying major points (heading/subheadings) and answers to questions from the "Q" step. This recital step may be done either in an oral or written format and is related to the benefits of retrieval ([testing effect](#)) in boosting long-term memory for the material.

VII. Record.

VIII. Reflect-The final "R" is "Review." Once you reach the end of the passage, review the material by repeating back to yourself what the point of the passage is using your own words. You may then repeat the process on the second set of questions.

Method 2 - Use 80/20 Principle For Reading

- I. Never read a book from cover to cover, except for pleasure. When you are working, find out what the book is saying much faster than you would by reading it through.
- II. Read Conclusion
- III. Read Introduction
- IV. Then Dip Lightly Into Any Interesting Bits.
- V. Apply 80/20 Principle to find out, What are 20% of Pages, which provides 80% of Information.
 - **Once you Find Out, what is 20% input that gives 80% Output. Then You need to Put 100% effort into those 20% inputs, to achieve the best results. Additionally Remove Trivial Many.**
- VI. Once You Identified 20%, then you need to put 100% effort into those 20%.
The You need to do the following:
 - Read.
 - Ask Questions.
 - Review.
 - Read.
 - Ask Questions Again.
 - Review.
- VII. **Summary:** The student summarises the topic, bringing his or her own understanding of the process. This may include written notes, spider diagrams, flow diagrams, labeled diagrams, [mnemonics](#), or even voice recordings.
 - Who?
 - What?
 - When?
 - Where?
 - Why?
 - How?
- VIII. **Test:** The student answers the questions drafted earlier, avoiding adding any questions that might distract or change the subject.

Method 3-Preview, Question, Read,

Summary, Test(PQRST)

PQRSTF

- I. **Preview:** The student looks at the topic to be learned by glancing over the major headings or the points in the syllabus.
- II. **Question:** The student formulates questions to be answered following a thorough examination of the topic(s).
- III. **Read or Listen:** The student reads through the related material, focusing on the information that best relates to the questions formulated earlier.
- IV. **Summary:** The student summarises the topic, bringing his or her own understanding of the process. This may include written notes, spider diagrams, flow diagrams, labeled diagrams, [mnemonics](#), or even voice recordings.
 - Who?
 - What?
 - When?
 - Where?
 - Why?
 - How?
- V. **Test:** The student answers the questions drafted earlier, avoiding adding any questions that might distract or change the subject.
- VI. Always Have doubt about everything, and always. Do not be afraid to ask questions About Everything. Ask Questions:
 - Who?
 - What?
 - When?
 - Where?
 - Why?
 - How?

Method 4-Flip Through Pages and Analyse

Flipping through the pages and analyse

- I. Flip through pages or listen through few pages.
 - Find out what is on page.
 - Check Pictures, tables, how long is chapter.
- II. Go to the end of chapter and see if there is any quiz or questions.
 - Check quiz or questions is to know what look for.
 - What the author think is important.
 - Use 80/20 rules.
- III. Read or Listen Bold printed text.
 - Title.
 - Subtitle.
 - Headings.
 - Broke down information.
- IV. Read or Listen first and last sentence of each paragraph.
 - First sentence is introduction and gives indication of what the paragraph looks like.
 - Last sentence summoned up the paragraph.
- V. 80/20 Rules apply.
 - Review and decide the most important information 20% of material to give 80% of result or most important information.
- VI. Repetition as many times as possible.
- VII. Always Have doubt about everything, and always. Do not be afraid to ask questions About Everything. Ask Questions:
 - Who?
 - What?
 - When?
 - Where?
 - Why?
 - How?

Method 5-Devotional Bible Study by Using

Devotional Books

Step 1-Open Part 4-6 For Deep Work, Deep Study Bible. Then Open Bible. Choose A devotional Book.

1. Morning and Evening by Charles Spurgeon.
2. The MacArthur Daily Bible by John MacArthur.
3. The NKJV Daily Bible_ Read the Entire Bible in One Year.
4. Amplified Cross-Reference Bible.
5. New Spirit-Filled Life Bible_ Kingdom Equipping Through the Power of the Word.
6. The MacArthur Study Bible, English Standard Version.
7. Through the Bible Through the Year_ Daily Reflections From Genesis to Revelation.
8. Learn the Bible in 24 hrs. (complete).
9. How to Read the Bible through the Jesus Lens_ A Guide to Christ-Focused Reading of Scripture.

Step 2-Record Passage Information.

1. Record the name of the book in which passage you are studying is found.
2. Record chapter and verse number you have selected to study.

Step 3 Identify The Subject

1. Read the portion of Scripture which you have selected to study.
2. Select a title that summarises the subject and record it on your chart.

Step 4-identify the Key verse

1. Which verse provides the best summary of the scripture portion you are studying?
2. Write the verse and reference on your chart.

Step 5-Summarise

1. In your own words, summarise what the portion of Scriptures Teaches.
2. Outline the main points covered.
3. Use Chart to summarise the passage.
4. Make a brief summary statement.
5. Paraphrase the passage. Paraphrasing is when you take a verse and summarise it In your own word. Follow the text, but put it in the language today.
6. Ask Questions
 - Who?
 - What?
 - When?
 - Where?
 - Why?
 - How?

Step 6-Pray For Insight on How to Apply the Passage

1. Ask God to help you apply the Scripture you are studying and show you specifically what he wants you to do. You already know that God wants you to do two things: obey his Word and share it with others. In your prayer tell God that you are ready to obey what he will show you and that you are willing to share that application with others.

Method 6-Devotional Bible Read

Step 1-Open Part 4-6 For Deep Work, Deep Study Bible. Then Open Bible. Choose A devotional Book.

1. Amplified Cross-Reference Bible.
2. New Spirit-Filled Life Bible_ Kingdom Equipping Through the Power of the Word.
3. The MacArthur Study Bible, English Standard Version.

Step 2-Record Passage Information

1. Record the name of the book in which passage you are studying is found.
2. Record chapter and verse number you have selected to study.

Step 3 Identify The Subject

1. Read the portion of Scripture which you have selected to study.
2. Select a title that summarises the subject and record it on your chart.

Step 4-identify the Key verse

1. Which verse provides the best summary of the scripture portion you are studying?
2. Write the verse and reference on your chart.

Step 5-Summarise

1. In your own words, summarise what the portion of Scriptures Teaches.
2. Outline the main points covered.
3. Use Chart to summarise the passage.
4. Make a brief summary statement.
5. Paraphrase the passage. Paraphrasing is when you take a verse and summarise it In your own word. Follow the text, but put it in the language today.

Step 6-Pray For Insight on How to Apply the Passage

1. Ask God to help you apply the Scripture you are studying and show you specifically what he wants you to do. You already know that God wants you to do two things: obey his Word and share it with others. In your prayer tell God that you are ready to obey what he will show you and that you are willing to share that application with others.

Step 7-Write out an Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.

Step 8-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarise its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

*Step 19-Ask Question. While Re-listen
Lectures, Read Books or Lecture Notes
1-1000 Times.*

1. **Ask Question. While Re-listen Lectures, Read Books or Lecture Notes 1-100 Times.**
 - A. Who?
 - B. What?
 - C. Where?
 - D. When?
 - E. Why?
 - F. How?
 - G. So What?
 - H. Ask What I do Understand and Find Out What I did not understand.
 - I. Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.

Step 20 - Take Notes.

1. The Blank Sheet

The single biggest change you can make to getting more out of the books you read is using the blank sheet method.

Over the years I've tested multiple approaches and this one works best for simplicity and effectiveness — it will 10x your comprehension overnight.

The blank sheet primes your brain for what you're about to read and shows you what you're learning.

Here's how it works:

1. Before you start reading a new book, take out a blank sheet of paper. Write down what you know about the book / subject you're about to read — a mind map if you will.
2. After you finish a reading session, spend a few minutes adding to the map with a different color.
3. Before you start your next reading session, review the page.
4. When you're done reading, put these 'blank sheets' into a binder that you periodically review.

2. Conventional Notes

Forget the teacher that yelled at you for writing in your book when you were a kid. You bought this thing. It's your property. You need to [write in the margins](#).

Here is a very [simple process to take notes while reading](#):

- At the end of each chapter write a few bullet points that summarise the main idea or specific points. Use your own words and not the authors. Try and connect it to something in your life — a memory or another idea. Also, make note any unanswered questions you had while reading.
- When you're done the book, put it down for a week.
- Pick up the book again and go through all your notes. In a lot of cases, reading your notes will be as good as reading the book again.
- On the inside cover write out the main idea of the book using your own words. If you find yourself stuck, review your notes. (This is called [the Feynman Technique](#)). Writing is the process by which we often discover we don't know what we are talking about.
- You can even make a custom index on the back cover with themes or topics.
- (Optional) Copy out the excerpts by hand and put them on the back of your blank sheet from above or type them out and put them into Evernote. Tag accordingly.

3. Note Taking

- I. Normal note-taking with as much detail as you can.
 - Copy down the information you ordinarily you need to know as you encounter the material.
- II. Summarising the information in your own words, clarifying the significance and noting question.
 - Do not repeat the initial note, even if you took your notes in complete sentences.
 - Converting the note to language that helps you understand the meaning is essential.
 - Try to make connection and find relationship within the information.
 - List any questions you have about the notes you have took in step 1.
- III. Connecting this particular piece of information to the lesson at large.
 - State any connection you can find between the subject of that note and the broader topic you are studying.
 - Is there any cause and effect relationship with broader topic.
- IV. Answering remaining questions and then summarising each distinct page or section again.
 - Revisit, synthesise and transform the information you have learned.

4. Cornell Note Taking

This method of note taking is useful because it enables you to keep track of questions or thoughts that occur to you while making notes. It also allows you to go back and add comments to a page of notes or connect ideas from one source to another.

The Cornell note taking method serves multiple purposes:

- Notes from the lecture or readings, so that you have a record of information you may have forgotten (Details section).
- Summary of what was covered in the lecture or reading which you can easily look through (Summary section).
- A set of key points and/or questions that serve as a mini study guide (Main Ideas section).

Method

During class

- o take down information in largest area of the page.
- o when instructor moves to new point, skip a few lines.

After class

- o complete phrases & sentences as much as possible.
- o for all significant information, write cue in left margin.

After writing the notes in the main space, use the left-hand space to label each idea and detail with a key word or "cue"

An example of Cornell Note taking form is below – blank sample follows.

DATE:

IDEA/ Name of the lecture:

Main Ideas and Questions

Details

Summary of Notes After Class

Homework For Next Week or Months

Important Information For assignment, Exam or Other

5. Richard Feynman Note-Taking Technique.

- I. Choose a concept and Write At the TOP Page. Select a topic you're interested in learning about and write it at the top of a blank page in a notebook.**
 - A. Write What You do Know About The Topic or Concept. Write what you know, as if you were explaining to yourself.**
 - B. Write What you Do not Know About The Topic or Concept. You need to be specific. Given the accumulated knowledge in the universe, most of us know nothing about most things! Writing down explicitly what you don't know provides you with a starting point.**
 - C. What Book Explains the Best About This Topic.**
 - D. You have to start small. You really only have a page (or a few) to fill up with information. You can't fit everything there is to know about "Evolutionary Science" or "Microeconomics" or "Psychology" on a page. Instead work on smaller more defined concepts or what might reliably be found on a midterm or final exam.**
 - E. Fully understand the complex topic first: Don't begin the learning process by explaining it before you actually understand it. Retention methods such as Feynman technique, active-recall and spaced repetition are for solidifying information that you already understand. Trying to solidify an information before you understand it might end up encoding wrong interpretation of a topic.**
 - F. Actually put the time and effort: Once you have selected the correct set of topics, make sure you actually spend the time and effort to go through the entirety of the techniques. Feynman technique is great for having a basic framework of the topic inside your head with the details chopped off. It's important to get a very clear picture of the basics in your head right - the details can be filled in later.**

G. Make it your own.

- Start with not knowing.
- Ask 'why?'. ask why $x=y$. or why does music has 12 notes and not 14.
- Study the story of what you are studying. E.g. study what was physics before Quantum theory. Why QT was needed, who were the people involved in developing the QT and how it changed the world.

H. Take Notes On the Topic From Study.

- I. Consolidate the information concisely onto a flashcard or some other place for long term retention: Once we really understand a topic to be able to explain the core principles without having to use jargon, we should hold onto that understanding. Unfortunately, a large portion of that information that we just gathered is lost within first 48 hours after learning. So note it down somewhere before you lose it. Optimise for spaced-repetition for next sessions.

J. Don't write notes on notes: Life is short.

II. Simplify The Topic For Myself First.

- A. Simplify your explanation so that YOU understand it. As long as the explanation is not simple enough for YOU to understand, spend more hours to break it down to basic, bare-bone, core ideas.
- B. Avoid jargon and complexity. The simpler the explanation, the more likely you are to remember it.
- C. Only Use Simple Words. The words a child would understand.
- D. Anyone can make a subject complicated but only someone who understands can make it simple. Jargon hides our lack of understanding. When forced to write out an idea from start to finish in simple language, you discover where you struggle, where it doesn't quite make sense, where you get frustrated, where you don't really understand as well as you thought. Only by identifying gaps in your knowledge can you fill them.
- E. But true understanding requires a more active process like *teaching*. Start out by formally teaching yourself. Write out a summary in your own words without looking at your notes. Or explain it to yourself out loud. Then take it to the next level by teaching other people. Teaching also initiates a feedback loop, where critique or questions can help us learn and sharpen our thinking.
- F. **It makes it harder to trick yourself.** When you have to truly explain something, whether through writing or aloud, you encounter the holes in your reasoning and the white spaces in your knowledge. Think of writing and teaching as a process to *obtain understanding*, not something you do once you already understand.

III. Reflect, Refine, and Simplify

- A. Only when you can explain the subject in simple terms do you understand it.
- B. Simple is beautiful.
- C. Review your notes to make sure you didn't mistakenly borrow any jargon or gloss over anything complicated.
- D. Read it out loud as if to a child. If the explanation isn't simple enough or sounds confusing, that's a good indication that you need to reflect and refine.
- E. Go back to the source material, reviewing the parts you don't quite understand yet.
- F. Repeat until you have a simple explanation.

- IV. Teach it to yourself or someone else. Write everything you know about a topic out as if you were explaining it to yourself. Alternately, actually teach it to someone else.**
- V. Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, podcast – and fill the gaps in your knowledge.**
- VI. Simplify your explanations and create analogies. Streamline your notes and explanation, further clarifying the topic until it seems obvious. Additionally, think of analogies that feel intuitive.**
 - A. Every field of study has its own specialised terms. While it may be important to know them, it's also important to not confuse knowing jargon with knowing concepts. The Feynman Technique involves simplifying our initial explanations and refining our understanding through simple analogies..Why this step works:
 - B. Simplicity is a proxy for understanding. It's easy enough to commit terms to memory, and repeat them back when prompted. But memorisation is not understanding. When we can't rely on big words that make us sound smart, we have to distill what we truly know to the most basic form. This is where true understanding takes place.
 - C. Analogies are easier to recall and explain. When you understand a challenging concept, analogies allow you to create a short-hand for recalling it quickly and explaining it to others clearly. Learning material often provides ready-made analogies for us. For example, we all probably have "the mitochondria are the powerhouse of the cell" burned into our collective memories. However, pushing ourselves to create our own analogies is even more powerful than regurgitating a borrowed one that we may not actually understand.

VII. Each it to yourself or someone else. Write everything you know about a topic out as if you were explaining it to yourself. Alternately, actually teach it to someone else.

- A. Classic learning mistake is reading an article or textbook and considering our learning complete. In reality, reading is not understanding. We might even take notes, essentially transcribing a resource's sentences into our notebooks. We often nod to ourselves, thinking we've grasped a subject. After all, *we've taken notes*.
- B. Remove any jargon or complexity.
- C. Only Use Simple Words. The words a child would understand.
- D. Anyone can make a subject complicated but only someone who understands can make it simple. Jargon hides our lack of understanding. When forced to write out an idea from start to finish in simple language, you discover where you struggle ... where it doesn't quite make sense ... where you get frustrated ... where you don't really understand as well as you thought. Only by identifying gaps in your knowledge can you fill them.
- E. But true understanding requires a more active process like *teaching*. Start out by formally teaching yourself. Write out a summary in your own words without looking at your notes. Or explain it to yourself out loud. Then take it to the next level by teaching other people. Teaching also initiates a feedback loop, where critique or questions can help us learn and sharpen our thinking.
- F. **It makes it harder to trick yourself.** When you have to truly explain something, whether through writing or aloud, you encounter the holes in your reasoning and the white spaces in your knowledge. Think of writing and teaching as a process to *obtain understanding*, not something you do once you already understand.
- G. **It's even harder to trick others.** If an explanation you're providing doesn't make sense, they'll often tell you or you can pick up cues like blank stares. As a test, ask them to repeat what you taught them in their own words. If they can't do this, your explanation is too complex — simplify it and use plain language.
- H. **You build confidence.** When you truly understand something, it clicks. You can explain it forward and backwards, pointing out exceptions and spotting logical inconsistencies. When this happens, it builds confidence and pushes

you to tackle even more challenging subjects knowing you have a solid framework for learning.

VIII. Reflect, Refine, and Simplify.

- A. Only when you can explain the subject in simple terms do you understand it.**
- B. Simple is beautiful.**
- C. Review your notes to make sure you didn't mistakenly borrow any jargon or gloss over anything complicated.**
- D. Read it out loud as if to a child. If the explanation isn't simple enough or sounds confusing, that's a good indication that you need to reflect and refine.**
- E. Go back to the source material, reviewing the parts you don't quite understand yet.**
- F. Repeat until you have a simple explanation.**

IX. Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, Journal, Newspaper, podcast or any other resource and source – and fill the gaps in your knowledge.

X. Simplify your explanations and create analogies. Streamline your notes and explanation, further clarifying the topic until it seems obvious. Additionally, think of analogies that feel intuitive.

- A. Every field of study has its own specialised terms. While it may be important to know them, it's also important to not confuse knowing jargon with knowing concepts. The Feynman Technique involves simplifying our initial explanations and refining our understanding through simple analogies..Why this step works:
- B. Simplicity is a proxy for understanding. It's easy enough to commit terms to memory, and repeat them back when prompted. But memorisation is not understanding. When we can't rely on big words that make us sound smart, we have to distill what we truly know to the most basic form. This is where true understanding takes place.
- C. Analogies are easier to recall and explain. When you understand a challenging concept, analogies allow you to create a short-hand for recalling it quickly and explaining it to others clearly. Learning material often provides ready-made analogies for us. For example, we all probably have "the mitochondria are the powerhouse of the cell" burned into our collective memories. However, pushing ourselves to create our own analogies is even more powerful than regurgitating a borrowed one that we may not actually understand.

XI. Organize and Review

- A. To test your understanding in the real world, run it by someone else. How effective was your explanation? What questions did they ask? What parts did they get confused about?
- B. When you're happy with your understanding, take the page you created with a simple explanation and put it into a binder. Following this technique for everything you learn gives you a binder full of learning that you can review a couple of times a year.

6. Flow Chart (More for the Debate, Discussion, Dialogue, Conversation and Communication)

A. Take Notes While the Opposition is speaking in Debate, Dialogue, Conversation and Communication:

- How To Take Notes- Flow Chart. By Taking Notes, I am sure that I am responding to my opponent's arguments and everything he brings up.

I. Make 11-12 Columns on the Pad. Prepare the left column in advance of the communication, debate. The Left Column needs to be filled in, if you starting first. If not, then leave left column as blank.

II. First Left Hand Column Are My Arguments.

III. Second Left Hand Column are Opposition Arguments and Responses to My arguments.

IV. Third Left Column are My Responses to the Opponent responses.

V. Fourth Left Hand Column are My Rebuttal.

VI. Fifth Left Hand Column are Opponent Rebuttal.

VII. Sixth Left Hand Column are my Responses to the Opponent rebuttal.

VIII. Seventh Left Hand Column is the Final My Rebuttal.

IX. Eight Left Hand Column is The opponent Rebuttal.

X. Ninth Left Hand Column is my closing statements.

XI. Tenth Left Hand Column is the opponent closing statements.

XII. Eleventh Left Hand Column is the Cross Examination.

- My Answer.
- Opponent Answer.
- My response to the response of the opponent.

7. Use Cornell Note Taking.

- A. Name.**
- B. Date.**
- C. Class and Period.**
- D. Topic.**
- E. Essential Question at the Top of Page.**
- F. Questions and Main Ideas on the Left Page of the Blank Page.**
- G. Notes On the Right Page of the Blank Page.**
- H. Summary at the bottom of the page.**

8. **Analytical Learners: Outline/ List.** Good Works well for recording terms, definitions, facts and sequences.
9. **Sentence Method:** The goal is to jot down your thoughts as quickly as possible. Works well in meetings or lectures that lack organisation. Use when information is being presented very quickly.
10. **SQ3R (Survey, Question, Read, Recite, Review).** Use for dense readings (like business books, text books, white papers, etc.). You start the process by skimming the material for bolded text, images, diagrams and summaries in order to produce a list of headlines or main topics.
11. **Mapping.** Mapping is a nonlinear system of note-taking that resembles a tree and root structure. Ideas stem from one major concept and are connected by lines (or “branches”). As a note-taking system, mapping works particularly well for visual learners, but it can also be a great tool for analytical-thinkers who have trouble brainstorming because it allows you to make connections you’d otherwise miss with a linear format. Works well for planning essays, recording meetings. Use for big-picture brainstorming sessions.
12. **Smart Wisdom.** It’s a tool optimised for active listening in lecture situations. Instead of taking notes in full sentences, you record only keywords and place them in a chain that maps the thought process.
13. **Diagram And Processes.** Diagrams help visually represent content. However they are not always versatile. A diagram usually serves one purpose best, so selecting the right diagram will make your notes more meaningful.
14. **Diagram And Processes.** Diagrams help visually represent content. However they are not always versatile. A diagram usually serves one purpose best, so selecting the right diagram will make your notes more meaningful.
15. **Charting.** Charting is a great note-taking strategies when you need to compare and contrast ideas. The most widely used charting method is the Pro and Con list.

16. CERC.

- A. Claim.**
- B. Evidence.**
- C. Reasoning.**
- D. Conclusion.**

17. Use Smart Notes.

- A. What is big Idea.**
- B. Question.**
- C. Evidence.**
- D. Conclusion.**

*Step 21-Ask Question. While Re-listen
Lectures, Read Books or Lecture Notes
1-1000 Times. Do It Correctly, Slowly,
Patiently, Methodically, Logically Take It
Time and Do Not Rush Process.*

**1. Step 1-Ask Question. While Re-listen Lectures, Read Books or
Lecture Notes 1-100 Times.**

- A. Who?
- B. What?
- C. Where?
- D. When?
- E. Why?
- F. How?
- G. So What?
- H. Ask What I do Understand and Find Out What I did not understand.

Step 22 - Basic Exploration, Experimentation and Practice.

1. Basic Exploration, Experimentation and Practice.

- I. The primary goal here is to simply explore based on your instincts without attempting to achieve any particular purpose. The experimentation is obviously with respect to the particular module you are focusing.
- II. If your modules focus on some technology-orientated topic, then in this step you play around with different software to familiarise yourself with these different tools to understand ways in which they functions.
- III. If your topic is something more theoretical, then you would need to ponder what exactly you want to learn about and then form some hypotheses about how those concepts or process manifest themselves, and the best way you can start learning them.
- IV. The goal of this step is to stipulate (demand) our mind to start asking the right questions about our modules. These questions will be most important outcome of this step.
- V. This step entails answering the questions you came up with in the previous step.
- VI. In this steps you will attempt to answer at least some of these questions if not all of them. For this, you would need to revisit the various resources you aggregated earlier and use them to first, answer all the questions you came up. Second to acquire as much knowledge as you can. Continue this process until you believe you have learned enough about this specific module.
- VII. You would need to go back and forth between learning new things and applying them practically to reinforce your newfound knowledge.
- VIII. Split time between learning and practical application.
- IX. Experiment on trial and error.
- X. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process.**

Step 23 - Take Notes.

1. The Blank Sheet

The single biggest change you can make to getting more out of the books you read is using the blank sheet method.

Over the years I've tested multiple approaches and this one works best for simplicity and effectiveness — it will 10x your comprehension overnight.

The blank sheet primes your brain for what you're about to read and shows you what you're learning.

Here's how it works:

1. Before you start reading a new book, take out a blank sheet of paper. Write down what you know about the book / subject you're about to read — a mind map if you will.
2. After you finish a reading session, spend a few minutes adding to the map with a different color.
3. Before you start your next reading session, review the page.
4. When you're done reading, put these 'blank sheets' into a binder that you periodically review.

2. Conventional Notes

Forget the teacher that yelled at you for writing in your book when you were a kid. You bought this thing. It's your property. You need to [write in the margins](#).

Here is a very [simple process to take notes while reading](#):

- At the end of each chapter write a few bullet points that summarise the main idea or specific points. Use your own words and not the authors. Try and connect it to something in your life — a memory or another idea. Also, make note any unanswered questions you had while reading.
- When you're done the book, put it down for a week.
- Pick up the book again and go through all your notes. In a lot of cases, reading your notes will be as good as reading the book again.
- On the inside cover write out the main idea of the book using your own words. If you find yourself stuck, review your notes. (This is called [the Feynman Technique](#)). Writing is the process by which we often discover we don't know what we are talking about.
- You can even make a custom index on the back cover with themes or topics.
- (Optional) Copy out the excerpts by hand and put them on the back of your blank sheet from above or type them out and put them into Evernote. Tag accordingly.

3. Note Taking

- I. Normal note-taking with as much detail as you can.
 - Copy down the information you ordinarily you need to know as you encounter the material.
- II. Summarising the information in your own words, clarifying the significance and noting question.
 - Do not repeat the initial note, even if you took your notes in complete sentences.
 - Converting the note to language that helps you understand the meaning is essential.
 - Try to make connection and find relationship within the information.
 - List any questions you have about the notes you have took in step 1.
- III. Connecting this particular piece of information to the lesson at large.
 - State any connection you can find between the subject of that note and the broader topic you are studying.
 - Is there any cause and effect relationship with broader topic.
- IV. Answering remaining questions and then summarising each distinct page or section again.
 - Revisit, synthesise and transform the information you have learned.

4. Cornell Note Taking

This method of note taking is useful because it enables you to keep track of questions or thoughts that occur to you while making notes. It also allows you to go back and add comments to a page of notes or connect ideas from one source to another.

The Cornell note taking method serves multiple purposes:

- Notes from the lecture or readings, so that you have a record of information you may have forgotten (Details section).
- Summary of what was covered in the lecture or reading which you can easily look through (Summary section).
- A set of key points and/or questions that serve as a mini study guide (Main Ideas section).

Method

During class

- o take down information in largest area of the page.
- o when instructor moves to new point, skip a few lines.

After class

- o complete phrases & sentences as much as possible.
- o for all significant information, write cue in left margin.

After writing the notes in the main space, use the left-hand space to label each idea and detail with a key word or "cue"

An example of Cornell Note taking form is below – blank sample follows.

DATE:

IDEA/ Name of the lecture:

Main Ideas and Questions

Details

Summary of Notes After Class

Homework For Next Week or Months

Important Information For assignment, Exam or Other

5. Richard Feynman Note Talking Technique

- I. Choose a concept and Write At the TOP Page. Select a topic you're interested in learning about and write it at the top of a blank page in a notebook.**
 - A. Write What You do Know About The Topic or Concept. Write what you know, as if you were explaining to yourself.**
 - B. Write What you Do not Know About The Topic or Concept. You need to be specific. Given the accumulated knowledge in the universe, most of us know nothing about most things! Writing down explicitly what you don't know provides you with a starting point.**
 - C. What Book Explains the Best About This Topic.**
 - D. You have to start small. You really only have a page (or a few) to fill up with information. You can't fit everything there is to know about "Evolutionary Science" or "Microeconomics" or "Psychology" on a page. Instead work on smaller more defined concepts or what might reliably be found on a midterm or final exam.**
 - E. Fully understand the complex topic first: Don't begin the learning process by explaining it before you actually understand it. Retention methods such as Feynman technique, active-recall and spaced repetition are for solidifying information that you already understand. Trying to solidify an information before you understand it might end up encoding wrong interpretation of a topic.**
 - F. Actually put the time and effort: Once you have selected the correct set of topics, make sure you actually spend the time and effort to go through the entirety of the techniques. Feynman technique is great for having a basic framework of the topic inside your head with the details chopped off. It's important to get a very clear picture of the basics in your head right - the details can be filled in later.**

G. Make it your own.

- Start with not knowing.
- Ask 'why?'. ask why $x=y$. or why does music has 12 notes and not 14.
- Study the story of what you are studying. E.g. study what was physics before Quantum theory. Why QT was needed, who were the people involved in developing the QT and how it changed the world.

H. Take Notes On the Topic From Study.

- I. Consolidate the information concisely onto a flashcard or some other place for long term retention: Once we really understand a topic to be able to explain the core principles without having to use jargon, we should hold onto that understanding. Unfortunately, a large portion of that information that we just gathered is lost within first 48 hours after learning. So note it down somewhere before you lose it. Optimise for spaced-repetition for next sessions.

J. Don't write notes on notes: Life is short.

II. Simplify The Topic For Myself First.

- A. Simplify your explanation so that YOU understand it. As long as the explanation is not simple enough for YOU to understand, spend more hours to break it down to basic, bare-bone, core ideas.
- B. Avoid jargon and complexity. The simpler the explanation, the more likely you are to remember it.
- C. Only Use Simple Words. The words a child would understand.
- D. Anyone can make a subject complicated but only someone who understands can make it simple. Jargon hides our lack of understanding. When forced to write out an idea from start to finish in simple language, you discover where you struggle, where it doesn't quite make sense, where you get frustrated, where you don't really understand as well as you thought. Only by identifying gaps in your knowledge can you fill them.
- E. But true understanding requires a more active process like *teaching*. Start out by formally teaching yourself. Write out a summary in your own words without looking at your notes. Or explain it to yourself out loud. Then take it to the next level by teaching other people. Teaching also initiates a feedback loop, where critique or questions can help us learn and sharpen our thinking.
- F. **It makes it harder to trick yourself.** When you have to truly explain something, whether through writing or aloud, you encounter the holes in your reasoning and the white spaces in your knowledge. Think of writing and teaching as a process to *obtain understanding*, not something you do once you already understand.

III. Reflect, Refine, and Simplify

- A. Only when you can explain the subject in simple terms do you understand it.
- B. Simple is beautiful.
- C. Review your notes to make sure you didn't mistakenly borrow any jargon or gloss over anything complicated.
- D. Read it out loud as if to a child. If the explanation isn't simple enough or sounds confusing, that's a good indication that you need to reflect and refine.
- E. Go back to the source material, reviewing the parts you don't quite understand yet.
- F. Repeat until you have a simple explanation.

- IV. Teach it to yourself or someone else. Write everything you know about a topic out as if you were explaining it to yourself. Alternately, actually teach it to someone else.**
- V. Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, podcast – and fill the gaps in your knowledge.**
- VI. Simplify your explanations and create analogies. Streamline your notes and explanation, further clarifying the topic until it seems obvious. Additionally, think of analogies that feel intuitive.**
 - A. Every field of study has its own specialised terms. While it may be important to know them, it's also important to not confuse knowing jargon with knowing concepts. The Feynman Technique involves simplifying our initial explanations and refining our understanding through simple analogies..Why this step works:
 - B. Simplicity is a proxy for understanding. It's easy enough to commit terms to memory, and repeat them back when prompted. But memorisation is not understanding. When we can't rely on big words that make us sound smart, we have to distill what we truly know to the most basic form. This is where true understanding takes place.
 - C. Analogies are easier to recall and explain. When you understand a challenging concept, analogies allow you to create a short-hand for recalling it quickly and explaining it to others clearly. Learning material often provides ready-made analogies for us. For example, we all probably have "the mitochondria are the powerhouse of the cell" burned into our collective memories. However, pushing ourselves to create our own analogies is even more powerful than regurgitating a borrowed one that we may not actually understand.

VII. Teach it to yourself or someone else. Write everything you know about a topic out as if you were explaining it to yourself. Alternately, actually teach it to someone else.

- A. Classic learning mistake is reading an article or textbook and considering our learning complete. In reality, reading is not understanding. We might even take notes, essentially transcribing a resource's sentences into our notebooks. We often nod to ourselves, thinking we've grasped a subject. After all, *we've taken notes*.
- B. Remove any jargon or complexity.
- C. Only Use Simple Words. The words a child would understand.
- D. Anyone can make a subject complicated but only someone who understands can make it simple. Jargon hides our lack of understanding. When forced to write out an idea from start to finish in simple language, you discover where you struggle ... where it doesn't quite make sense ... where you get frustrated ... where you don't really understand as well as you thought. Only by identifying gaps in your knowledge can you fill them.
- E. But true understanding requires a more active process like *teaching*. Start out by formally teaching yourself. Write out a summary in your own words without looking at your notes. Or explain it to yourself out loud. Then take it to the next level by teaching other people. Teaching also initiates a feedback loop, where critique or questions can help us learn and sharpen our thinking.
- F. **It makes it harder to trick yourself.** When you have to truly explain something, whether through writing or aloud, you encounter the holes in your reasoning and the white spaces in your knowledge. Think of writing and teaching as a process to *obtain understanding*, not something you do once you already understand.
- G. **It's even harder to trick others.** If an explanation you're providing doesn't make sense, they'll often tell you or you can pick up cues like blank stares. As a test, ask them to repeat what you taught them in their own words. If they can't do this, your explanation is too complex — simplify it and use plain language.
- H. **You build confidence.** When you truly understand something, it clicks. You can explain it forward and backwards, pointing out exceptions and spotting logical inconsistencies. When this happens, it builds confidence and pushes

you to tackle even more challenging subjects knowing you have a solid framework for learning.

VIII. Reflect, Refine, and Simplify.

- A. Only when you can explain the subject in simple terms do you understand it.**
- B. Simple is beautiful.**
- C. Review your notes to make sure you didn't mistakenly borrow any jargon or gloss over anything complicated.**
- D. Read it out loud as if to a child. If the explanation isn't simple enough or sounds confusing, that's a good indication that you need to reflect and refine.**
- E. Go back to the source material, reviewing the parts you don't quite understand yet.**
- F. Repeat until you have a simple explanation.**

IX. Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, Journal, Newspaper, podcast or any other resource and source – and fill the gaps in your knowledge.

X. Simplify your explanations and create analogies. Streamline your notes and explanation, further clarifying the topic until it seems obvious. Additionally, think of analogies that feel intuitive.

- A. Every field of study has its own specialised terms. While it may be important to know them, it's also important to not confuse knowing jargon with knowing concepts. The Feynman Technique involves simplifying our initial explanations and refining our understanding through simple analogies..Why this step works:
- B. Simplicity is a proxy for understanding. It's easy enough to commit terms to memory, and repeat them back when prompted. But memorisation is not understanding. When we can't rely on big words that make us sound smart, we have to distill what we truly know to the most basic form. This is where true understanding takes place.
- C. Analogies are easier to recall and explain. When you understand a challenging concept, analogies allow you to create a short-hand for recalling it quickly and explaining it to others clearly. Learning material often provides ready-made analogies for us. For example, we all probably have "the mitochondria are the powerhouse of the cell" burned into our collective memories. However, pushing ourselves to create our own analogies is even more powerful than regurgitating a borrowed one that we may not actually understand.

XI. Organize and Review

- A. To test your understanding in the real world, run it by someone else. How effective was your explanation? What questions did they ask? What parts did they get confused about?
- B. When you're happy with your understanding, take the page you created with a simple explanation and put it into a binder. Following this technique for everything you learn gives you a binder full of learning that you can review a couple of times a year.

6. Flow Chart (More for the Debate, Discussion, Dialogue, Conversation and Communication)

A. Take Notes While the Opposition is speaking In Debate, Dialogue, Conversation and Communication:

- How To Take Notes- Flow Chart. By Taking Notes, I am sure that I am responding to my opponent's arguments and everything he brings up.

I. Make 11-12 Columns on the Pad. Prepare the left column in advance of the communication, debate. The Left Column needs to be filled in, if you starting first. If not, then leave left column as blank.

II. First Left Hand Column Are My Arguments.

III. Second Left Hand Column are Opposition Arguments and Responses to My arguments.

IV. Third Left Column are My Responses to the Opponent responses.

V. Fourth Left Hand Column are My Rebuttal.

VI. Fifth Left Hand Column are Opponent Rebuttal.

VII. Sixth Left Hand Column are my Responses to the Opponent rebuttal.

VIII. Seventh Left Hand Column is the Final My Rebuttal.

IX. Eight Left Hand Column is The opponent Rebuttal.

X. Ninth Left Hand Column is my closing statements.

XI. Tenth Left Hand Column is the opponent closing statements.

XII. Eleventh Left Hand Column is the Cross Examination.

- My Answer.
- Opponent Answer.
- My response to the response of the opponent.

7. Use Cornell Note Taking.

- A. Name.**
- B. Date.**
- C. Class and Period.**
- D. Topic.**
- E. Essential Question at the Top of Page.**
- F. Questions and Main Ideas on the Left Page of the Blank Page.**
- G. Notes On the Right Page of the Blank Page.**
- H. Summary at the bottom of the page.**

8. **Analytical Learners: Outline/ List.** Good Works well for recording terms, definitions, facts and sequences.
9. **Sentence Method:** The goal is to jot down your thoughts as quickly as possible. Works well in meetings or lectures that lack organisation. Use when information is being presented very quickly.
10. **SQ3R (Survey, Question, Read, Recite, Review).** Use for dense readings (like business books, text books, white papers, etc.). You start the process by skimming the material for bolded text, images, diagrams and summaries in order to produce a list of headlines or main topics.
11. **Mapping.** Mapping is a nonlinear system of note-taking that resembles a tree and root structure. Ideas stem from one major concept and are connected by lines (or “branches”). As a note-taking system, mapping works particularly well for visual learners, but it can also be a great tool for analytical-thinkers who have trouble brainstorming because it allows you to make connections you’d otherwise miss with a linear format. Works well for planning essays, recording meetings. Use for big-picture brainstorming sessions.
12. **Smart Wisdom.** It’s a tool optimised for active listening in lecture situations. Instead of taking notes in full sentences, you record only keywords and place them in a chain that maps the thought process.
13. **Diagram And Processes.** Diagrams help visually represent content. However they are not always versatile. A diagram usually serves one purpose best, so selecting the right diagram will make your notes more meaningful.
14. **Diagram And Processes.** Diagrams help visually represent content. However they are not always versatile. A diagram usually serves one purpose best, so selecting the right diagram will make your notes more meaningful.
15. **Charting.** Charting is a great note-taking strategies when you need to compare and contrast ideas. The most widely used charting method is the Pro and Con list.

16. CERC.

- A. Claim.**
- B. Evidence.**
- C. Reasoning.**
- D. Conclusion.**

17. Use Smart Notes.

- A. What is big Idea.**
- B. Question.**
- C. Evidence.**
- D. Conclusion.**

*PART 4: Rules of Reading For
Bible Study, Deep Work, Deep
Study And Powerful Goodness.*

Step 24- Decide The Rules of Reading For Bible Study Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method.

1. Decide The Rules of Reading For Bible Study, Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method.

- I. Method 1-Chapter Summary Method.
- II. Method 2-Character Quality Method.
- III. Method 3-Thematic Method.
- IV. Method 4-Biographical Method.
- V. Method 5-Topical Method.
- VI. Method 6-Word Study Method.
- VII. Method 7-Book Background Method.
- VIII. Method 8-Book Survey Method.
- IX. Method 9-Chapter Analysis Method.
- X. Method 10-Paragraph Study.
- XI. Method 11-Verse by Verse Analysis Method.
- XII. Method 12-Book Synthesis Method.
- XIII. Method 13-Theological Study Method.
- XIV. Method 14-Studying Bible Prophecy.
- XV. Method 15-Typological Study Method.
- XVI. Method 16- John MacArthur Way Bible Study.
- XVII. Method 17-Inductive Bible Study Method.
- XVIII. Method 18-BIBLICAL HERMENEUTICS.
- XIX. Method 19-Theological Group of Principles.
- XX. Method 20- How To Read A Book.

Step 25-How Many Pages Read A Day.

1. Step 1-How Many Pages Read A Day.

- I. Read no more than 2-25 pages a day, and do The Work Required to Have an Opinion on Any Topic and Anything.
- II. The ideal is not merely to read or Listen faster, but to read or Listen at different speeds, and to know when the different speeds are appropriate.

Step 26 - Do Not Speed Read.

1. Do Not Speed Read.

- I. **Don't fool yourself.** While reading is the key to getting smarter, speed reading is just a fancy way of fooling yourself into thinking you're learning something. In reality Speed reading is just turning pages quickly.
- II. **Reading fast is not thinking.** If you're reading fast you're not thinking and challenging what you're reading. You're not being critical. You're not making connections with existing knowledge. You're not arguing with the author. You're not reading something at the edge of your cognitive ability. All of that is work. And if you're not doing the work, you're only walking away with surface knowledge. Reading is mentally demanding.
- III. **Reading fast is worse than not reading.** Reading fast gives you two things that should never mix: surface knowledge and overconfidence. And that's a recipe for really bad decisions. Bad decisions reduce the free time we have. After all, we have to run around fixing all of these mistakes.
- IV. **Visible costs get attention, invisible ones don't.** Most people choose the path of low upfront visible costs and high visible costs later. If you're willing to incur the cost of reading correctly and appropriately (it takes more time than speed reading), you get a massive benefit later. If you speed-read, you're incurring invisible costs that show up later in your lack of real understanding. Ignorance is more expensive than investing the time necessary to get smarter.
- V. **There's a better solution, anyways.** Learning what a good book really looks like, and learning how to skip the bad ones, is a far more robust time saver than speed-reading. Hope your radar for a great book, be a little ruthless about culling and quitting the weak. Don't waste time reading.
- VI. **Most people want to create the impression they read.** That they have unique insights. That they know what they're talking about. In the end however, when it comes to doing the work, they walk away. That's why there is so much value in reading. Do the work.
- VII. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process Of Reading.**

Step 27-Slow Down

- 1. Do Not Rush Any Tasks I will do At Any Time.**
- 2. Listen and Apply Book “The Slow Fix Solve Problems, Work Smarter, and Live Better in a World Addicted to Speed”**
- 3. Listen and Apply Book *In Praise Of Slowness Challenging the Cult of Speed BY Carl Honore.**

- I. We live in a world scarce of understanding and abundant with information. We complain that we never have any free time yet we seek distraction. If work can't distract us, we distract ourselves. We crave perpetual stimulation and motion. We're so busy that our free time comes in 20 second bursts, just long enough for us to read the gist and assume we understand. If we are to synthesize learning and understanding we need time to think.
- II. The modern storm of bits and stimulation, relents only when we sleep. (And then only if we remember to turn off the phone.) Lost in all of this is the art of stillness. We live in a world with more information than ever and yet we understand less. We have come into the belief that the simple act of reading confers understanding. Worse, most of our reading is elementary reading, or skimming — a far cry from syntopical reading, which seems more fertile for the mind willing to do the work.
- III. But that's just it. We don't want, or can't find the time, to do the work that's required to hold an opinion. It's much easier to simply read the opinions of another and let them think for us.
- IV. Understanding comes from focusing, chewing, and relentlessly ragging on a problem. It comes with false starts, dead ends, and frustration. Thinking requires time and space. It's slow. It means saying I don't know. In short, thinking is everything the modern workplace is designed to eradicate.
- V. We're expected to have an opinion about everything and yet our time to think is near zero. We hold more opinions than ever but have less understanding. We don't even understand ourselves. How could it be otherwise?
- VI. As Milan Kundera wrote in his 1996 novella Slowness, “When things happen too fast, nobody can be certain about anything, about anything at all, not even about himself. “In our fast-moving modern world, it always seems that the time-train is

pulling out of the station just as we reach the platform. No matter how fast we go, no matter how cleverly we schedule, there are never enough hours in the day.”

VII. Carl Honore, wrote a book, In Praise of Slowness: Challenging the Cult of Speed, to explore why we’re always in such a rush, what if anything is the cure for time-sickness, and whether it’s desirable to slow down. The book is not an all-out declaration of war against speed. Speed has helped to remake our world in ways that are wonderful and liberating. Who wants to live without the Internet or jet travel? The problem is that our love of speed, our obsession with doing more and more in less and less time, has gone too far; it has turned into an addiction, a kind of idolatry. Even when speed starts to backfire, we invoke the go-faster gospel.

VIII. When we rush, we skim the surface, and fail to make real connections with the world or other people.” Moreover we don’t make connections with ideas. We don’t synthesize. We don’t test theories over time. We don’t play with ideas.

IX. The implications on thinking are fascinating. We are all fast-thinkers now. We have forgotten how to look forward to things, and how to enjoy the moment when they arrive. Restaurants report that hurried diners increasingly pay the bill and order a taxi while eating dessert. Many fans leave sporting events early, no matter how close the score is, simply to steal a march on the traffic. Then there is the curse of multi-tasking. Doing two things at once seems so clever, so efficient, so modern. And yet what it often means is doing two things not very well. Like many people, I read the paper while watching TV— and find that I get less out of both. In this media-drenched, data-rich, channel-surfing, computer-gaming age, we have lost the art of doing nothing, of shutting out the background noise and distractions, of slowing down and simply being alone with our thoughts. Boredom — the word itself hardly existed 150 years ago— is a modern invention. Remove all stimulation, and we fidget, panic and look for something, anything, to do to make use of the time. When did you last see someone just gazing out the window on a train? Everyone is too busy reading the paper, playing video games, listening to iPods, working on the laptop, yammering into mobile phones. Instead of thinking deeply, or letting an idea simmer in the back of the mind, our instinct now is to reach for the nearest sound bite. In modern warfare, correspondents in the field and pundits in the studio spew out instant analyses of events as they occur. Often their insights turn out to be wrong. But that hardly matters nowadays: in the land of speed, the man with the instant response is king. With satellite feeds and twenty-four-hour news channels, the electronic media is dominated by what one

French sociologist dubbed “le fast thinker”— a person who can, without skipping a beat, summon up a glib answer to any question.

- X. Fast eats time. One consequence of fast is that we make poor decision after poor decision. Those decisions don't go away never to be seen again. It's not like we make a bad decision and we're done with it. No, the consequences are much worse. Poor decisions eat time. They come back to haunt you. They create issue after issue. They feed into the perpetual motion machine of busyness. And in a culture where people wear busyness as a badge of honour bad decisions actually lead us to think that we're doing more.

4. Do The Tasks Slowly, and Step By Step.

5. The Art of Slowing down and Do Not Rush Anything.

- I. The Art of Stillness is a persuasively argued case for the pleasures of slowing down and being in one place. Today we're going faster and faster in search of contentment and meaning. This is largely a recipe for ensuring we will never be happy. We have the sense, too often, of running at top speed and never being able to catch up.
- II. Too many of us see going nowhere as turning away from something rather than turning towards something.
- III. Going nowhere isn't about turning your back on the world; it's about stepping away now and then so that you can see the world more clearly and love it more deeply. “There is nothing either good or bad, but thinking makes it so.”
- IV. The idea behind choosing to sit still long enough to learn about yourself is simple and has been around for ages. Marcus Aurelius and Epictetus reminded us many millennia ago that it's how we respond to our experiences, not the experiences themselves, which shape us.
- V. The greatest weapon against stress is our ability to choose one thought over another. Part of making better decisions is making time to think. Something that few of us are able to do.
- VI. “Our creations come not when we're out in the world, gathering impressions, but when we're sitting still, turning those impressions into sentences.

Step 28-Isolating Myself For Deep Study, Deep Work AND Decide The Study or Work Philosophy

1. Listen and Apply Book on Deep Book and Power of Habits.

- I. 7 Habits of Highly Effective Families.
- II. Atomic Habit by James Clear.
- III. Deep Work by Cal Newport.
- IV. The Power of Habit_ Why We Do What We Do in Life and Business.
- V. The Ultimate Focus Strategy_ How to Set the Right Goals, Develop Powerful Focus, Stick to the Process, and Achieve Success.
- VI. Tools of Titans by Tim Ferris.

2. Create Physical and Mental Space For Isolated Work.

- I. Collaboration doesn't just happen online or over digital tools. And while most knowledge workers spend their days in **open offices** designed to create more interaction and collaboration. In reality, they rarely do that. Rather than increase our face-to-face interactions, open offices have been found to decrease them by up to 70%.
- II. If you **work at home** or remotely, you're not completely safe from this issue either. Yes, you need a physical space **devoid of distractions** to do focused work. But you also need to create mental space as well. This means getting over the feeling of needing to "catch up" and always be around on Slack and IM.
- III. To stay "bursty" try to only check in at specific times. That way your team knows when you're available and you can schedule your deep work around those periods.
- IV. To be the best collaborator possible, you need to balance between being around and being heads down. And according to the research, there are few better ways to do that then bringing a bit of "burstiness" into your day.

3. Power of Intermittent Isolation For Deep Study and Deep Work.

- I. We're actually more productive, efficient, and creative when we follow the lead of the ants and work "intermittently" rather than trying to be "always on." Especially when it comes to complex problem-solving.
- II. The isolated time helps to come up with the most creative ideas, and then came together as a group to explain, learn from each other, and narrow in on the highest-quality ones to present, I am working In the group.
- III. **We all do better work when we have time for both collaboration and private creative thinking.**
- IV. Constant communication—especially over tools like Slack and instant messengers—actually decrease both our productivity and **creativity**.
- V. Researchers looking at the productivity of remote teams found that those who practiced a "bursty" style of communication—rapid periods of collaboration followed by long periods of silence—were the most successful.
- VI. "During a rapid-fire burst of communication, team members can get input necessary for their work and develop ideas. Conversely, during longer periods of silence everyone is presumably hard at work acting upon the ideas that were exchanged in the communication burst."

4. Decide and Write Study Philosophy I Will Use For Today.

- I. **Monastic Philosophy.** The monastic philosophy involves cutting out all shallow activities to focus on deep work. This is a rather radical approach that focuses entirely on deep work and nothing else for weeks or months on end.
- II. **Bimodal Philosophy.** The bimodal philosophy involves splitting your schedule based on the amount of work. This would look like an individual spending at least a day or weeks on deep work, and once that is completed, the individual will focus on only shallow work. If you do this approach on a weekly basis, you could try to do all your deep work during weekdays, and your shallow work such as responding to emails, using social media, etc. on the weekends.
- III. **Rhythmic Philosophy.** The rhythmic strategy involves doing deep work as a daily habit. While the time of day you do your deep work each day doesn't matter, it's essential that if you choose this strategy, you stick with it. Time blocking certain hours, about 1 to 4 hours each day, to complete your deep work tasks is key. For example, Time blocking from 12 P.M. to 4 P.M. to do all your deep work tasks.

IV. Journalistic Philosophy. Journalistic strategy involves trying to do deep work whenever it fits into your schedule. This is extremely difficult to do. This is because constantly switching from deep to shallow work efficiently is hard and oftentimes only works for those who are more experienced with deep work.

Step 29 - The Power of Concentration

- I. Listen and Apply the following book-*The Ultimate Focus Strategy_ How to Set the Right Goals, Develop Powerful Focus, Stick to the Process, and Achieve Success.*
- II. The core of mindfulness is the ability to pay attention. That's exactly what Holmes does when he taps together the tips of his fingers, or exhales a fine cloud of smoke. He is centering his attention on a single element. And somehow, despite the seeming pause in activity, he emerges, time and time again, far ahead of his energetic colleagues.
- III. That's the thing about mindfulness. It seems to slow you down, but it actually gives you the resources you need to speed up your thinking.
- IV. All of humanity's problems stem from man's inability to sit quietly in a room alone."
- V. Step In Concentration
 - A. Eliminate distractions. How do we focus better if we are always bombarded with information? Make a practice to block time in your schedule to do a specific task or activity. During this time, request that you be left alone or go to a place where others are unlikely to disturb you: a library, a coffee shop, a private room.

Close social media and other apps, silence notifications, and keep your phone hidden from sight in a bag or backpack. As described in HBR, researchers found that cognitive capacity was significantly better when the phone was out of sight, not just turned off. Keep Your primary focus is to complete what you need to do. Shutting off both internal and external disturbances can help you to concentrate.
 - B. Reduce multitasking. Attempting to perform multiple activities at the same time makes us *feel* productive. It's also a recipe for lower focus, poor concentration, and lower productivity. And lower productivity can lead to burnout. Examples of multitasking include listening to a podcast while responding to an email or talking to someone over the phone while writing your report. Such multitasking not only hampers your ability to focus but compromises your work quality.

- C. Practice mindfulness and meditation. Meditating or practicing mindfulness activities can strengthen well-being and mental fitness and improve focus. During the meditation process, our brain becomes calmer and our whole body becomes more relaxed. We focus on our breath during the process so that we will not be distracted by our minds. With practice, we can learn to use our breath to bring our attention back to a particular task so that it can be done well even if we get interrupted. Steps in Mindfulness
- A. Step 1: Breathe In Deeply, And Breathe Out Slowly, Letting Yourself Relax.
 - B. Step 2: Gently Ask Your Mind To Keep Aside All Your Worries And Concerns.
 - C. Step 3: Bring More Awareness Into Breathing, Feeling It With Your Senses.
 - D. Step 4: Start Counting Your Breaths Slowly. Bring Your Mind Back If It Wanders.
 - E. Step 5: Get Immersed In The Present, Losing Consciousness Of Your Surroundings.
 - F. Step 6: Accept The Thoughts And Emotions Moving Across Your Mind Just As They Are.
- G. Get more sleep. Many factors affect your sleep. One of the most common is reading from an electronic device like a computer, phone, or tablet or watching your favourite movie or TV show on an LED TV just before bedtime. Research has shown that such devices emit light towards the blue end of the spectrum. Such light will stimulate your eye retina and prevent the secretion of melatonin that promotes sleep anticipation in the brain. Use a filter or "blue light" glasses to minimise such blue light or avoid all electronic devices before bed. Other ways to improve sleep include avoiding exercise late in the day, staying hydrated throughout the day, using journaling or breathing exercises to quiet the mind, and creating a predictable bedtime routine and schedule.
- H. Choose to focus on the moment. It might feel counterintuitive when you feel unable to concentrate, but remember that you choose where you focus. It's tough to concentrate when your mind is always in the

past and worrying about the future. While it isn't easy, make an effort to let go of past events. Acknowledge the impact, what you felt, and what you learned from it, then let it go. Similarly, acknowledge your concerns about the future, consider how you are experiencing that anxiety in your body, then choose to let it go. We want to train our mental resources to focus on the details of what matters at the moment. Our minds go in the direction we choose to focus.

- I. Take a short break. This also might seem counterintuitive, but when you focus on something for a long time, your focus may begin to die down. You may feel more and more difficulty devoting your attention to the task. Researchers have found that our brains tend to ignore sources of constant stimulation. Taking very small breaks by refocusing your attention elsewhere can dramatically improve mental concentration after that. The next time you are working on a project, take a break when you begin to feel stuck. Move around, talk to someone, or even switch to a different type of task. You will come back with a more focused mind to keep your performance high.
- J. Connect with nature. Research has found that even having plants in office spaces can help increase concentration and productivity, as well as workplace satisfaction and better air quality. Finding time to take a walk in the park or appreciating the plants or flowers in your garden can boost your concentration and help you feel refreshed.
- K. Train your brain. Scientific research is starting to amass evidence on the ability of brain training activities to enhance cognitive abilities, including concentration, in adults. Such brain training games can also help you develop your working and short-term memory, as well as your processing and problem-solving skills. Examples of such games include jigsaw puzzles, sudoku, chess, and brain-stimulating video games.
- L. Exercise. Start your day with simple exercise and get your body moving. According to the May 2013 issue of the Harvard Men's Health Watch, regular exercise releases chemicals key for memory, concentration, and mental sharpness. Other research found that exercise can boost the brain's dopamine, norepinephrine, and serotonin levels and all these will affect focus and attention.

Individuals who do some form of exercise or sports perform better on cognitive tasks when compared with those who have poor physical health. Physical movement helps relax the muscles and relieve tension in the body. Since the body and mind are so closely linked, when your body feels better so, too, will your mind.

M. Listen to music. Music has been shown to have therapeutic effects on our brains. Light music may help you to concentrate better, but some music may distract you. Experts generally agree that classical music and nature sounds, such as water flowing, are good choices for concentration while music with lyrics and human voices may be distracting. Multiple apps and services offer background music and soundscapes designed for different types of focus and work needs.

N. Eat well. Choose foods that moderate blood sugar, maintain energy, and fuel the brain. Fruits, vegetables, and high-fibre foods can keep your blood sugar levels even. Reduce sugary foods and drinks that cause spikes and dips in your sugar levels make you feel dizzy or drowsy.

Your brain needs lots of good fat to function properly. Nuts, berries, avocados, and coconut oil are all great ways to get healthy fats into your diet and help your brain run more smoothly. The science on Research has found that foods like blueberries can boost concentration and memory for up to 5 hours after consumption due to an enzyme that stimulates the flow of oxygen and blood to the brain, helping with memory as well as our ability to focus and learn new information. Leafy green vegetables such as spinach contain potassium which accelerates the connections between neurons and can make our brain more responsive.

O. Set a daily priority. Write down what you want to accomplish each day, ideally the night before, and identify a single priority that you commit to accomplishing. This will help focus your brain on what matters, tackling the big jobs first and leaving the small stuff till later. Break large tasks into smaller bytes so that you will not be overwhelmed. Identifying true priorities can help relieve distracting anxiety, and achieving small daily goals can wire your brain to achieve success.

- P. Create space for work.** Create a calm, dedicated space for work, if possible. Not everyone can have a well-appointed office, but desk organizers, noise-canceling headphones, an adjustable monitor, and adjustable lighting can help. Clear clutter out of sight, make it as ergonomic and comfortable as possible, and try to keep your space neat and ventilated.
- Q. Use a timer.** Train your brain to hyper-focus on a task by using a timer or phone alarm. First, decide what task you want to complete. Set your timer for 20 minutes (generally not more than 30 minutes) and concentrate on the task. When the alarm rings take a short break for 5 minutes. You can either take a walk and do some stretching exercise, then reset the timer and start again. This technique has shown to be effective to improve your concentration.
- R. Switch tasks.** While we may want to concentrate on a particular task, sometimes we get stuck and our brain needs something fresh to focus on. Try switching to other tasks or something you love to do. Switching tasks can help you stay alert and productive for a longer period.

Step 30-You Are Required To Do The Work to Have an Opinion on Any Topic.

1. When Give Opinion on Anything, Do Not Be so Angry and Mean to Others.
2. People Need To Stop Doing By Coming Unprepared To Give Opinion On Any Subject, Without Having Good Idea Of The Literature, and Arguments Written on Topic and Theme Available To Them. The people coming unprepared and not doing any Hard Work To Have an Opinion On The Subject or Topic. When People Coming Overconfidence, which could be resulting in Lack of Preparation, Which Could Lead That Your Position can be Destroyed with Ease. They simply won't do the work required. It's easy to come home, sit on the couch, watch TV, and zone out until bedtime rolls around. But that's not going to help you get smarter.
 - A. People Who Do Not Put The Required Work: The first thing they always do is tell you what they think. When someone has an opinion about everything, they want to share it with you. They often tout stats and research as if they had an imaginary checklist of facts they need to be able to rattle off to establish themselves as an expert in a field they actually know very little about. Because they have an opinion on everything, they are quick to judge others – for their lack of opinions, for their lack of knowledge, for their lack of outrage, and the list goes on.
 - B. People who have opinions about everything barf so much noise that it's hard to find the signal. Your brain has to work overtime to figure out if they did the work to come up with their opinions themselves or if they're simply regurgitating some oped in a newspaper. Over time, opinionated people also end up in their own prisons and they try to take you with them.
 - C. The problem comes from how we see the world. Our opinions are often rooted in how we think the world should work, according to our morals, values, and principles. If we see the world through the lens of our opinions, much of what happens will not agree with us. This is feedback, and how we respond to this feedback is key.

3. Do Not Have the Opinion and do not make any judgement about Anything, I see and hear, If I did not work Hard to have an opinion. I need to Read, Analyse, Research the topic from every angle, so that I can have an opinion or Make Judgement on the topic.
4. Be informed citizen is read more classical books and history. This unfolds how the real world works and where it is going. If You read Classical Books, then you can well predict what would happen next in the future based on the events happening.
5. How to Get Smarter Read. A lot. Warren Buffett says, "I just sit in my office and read all day." What does that mean? He estimates that he spends 80% of his working day reading and thinking. When asked how to get smarter, Buffett once held up stacks of paper and said, "Read 500 pages like this every week. That's how knowledge builds up, like compound interest." All of us can build our knowledge, but most of us won't put in the effort. "Go to bed smarter than when you woke up."
6. Do not read the newest books, but the great books of western world, stoic and classics, as these books stood the test of time.

7. How Long Does it Take To Prepare:

- A. Depend on the topic and opponent, and how much he's written.
- B. If the opponent nothing published, then there was very little preparation to be made because I simply didn't know what to expect.
- C. On the other hand, if the opponent has published lots of written work and have some videos. Read and what his written and videos and prepare the summaries articles, videos, and have sense where he is coming from. This can take Weeks or Months.

8. **Before Preparation.** The difference between the people who do the work and the people who just reel off memorized opinions is huge. When you do the work, you can answer the next question. You know when to follow the rules and when they'll get you in trouble. When I did my postgraduate I was surrounded by people who could answer the test questions. They got good grades — actually, they got *great* grades but an odd thing happened after school: a lot of those people couldn't apply their knowledge to problems they hadn't seen before. They were chauffeurs — they knew the memorized answer. They couldn't answer the next question. We're all chauffeurs in some aspects of our lives. This is why understanding your circle of competence is so critical to living a rational life.

I. Circle of Competence:

A. **Circle Of Competence**-Understanding my Circle of Competence helps to avoid problems, identify opportunities for improvement and learn from Others. Circle of Competence is simple: Each of us, through experience or study, has built up useful knowledge on certain areas of the world. Some areas are understood by most of us, while some areas require a lot more specialty to evaluate. For example, most of us have a basic understanding of the economics of a restaurant: You rent or buy space, spend money to outfit the place and then hire employees to seat, serve, cook, and clean. (And, if you don't want to do it yourself, manage.) From there, it's a matter of generating enough traffic and setting the appropriate prices to generate a profit on the food and drinks you serve—after all of your operating expenses have been paid. Though the cuisine, atmosphere, and price points will vary by restaurant, they all have to follow the same economic formula. That basic knowledge, along with some understanding of accounting and a little bit of study, would enable one to evaluate and invest in any number of restaurants and restaurant chains, public or private. It's not all that complicated. Far more important is to honestly define what we do know and stick to those areas. Our circle of competence can be widened, but only slowly and over time. Mistakes are most often made when straying from this discipline. Where should we devote our limited time in life, to achieve the most success? So, the simple takeaway here is clear. If you want to improve your odds of success in life and business, then define the perimeter of your circle of competence, and operate inside. Over time, work to expand that circle

but never fool yourself about where it stands today, and never be afraid to say “I don’t know.”

II. Two Type of Knowledge: The Max Planck and Chauffeur Test

A. The Two Types of Knowledge: The Max Planck and Chauffeur Test: How to distinguish between the two types of knowledge: real knowledge and pretend knowledge.

- The first type of knowledge is real. It can’t be bought. It can’t be copied. If you want real knowledge you need to earn it. One is Planck knowledge, the people who really know. They’ve paid the dues, they have the aptitude. You are going to have the problem in your life of getting the responsibility into the people with the Planck knowledge and away from the people with the chauffeur knowledge. Real knowledge comes when people do the work. The problem is that it’s difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.
- The second type of knowledge is copied. On the surface you know the answer but you lack the understanding to show your work. Then we’ve got chauffeur knowledge. They’ve learned the talk. They may have a big head of hair, they may have fine temper in the voice, they’ll make a hell of an impression. But in the end, all they have is chauffeur knowledge. I think I’ve just described practically every politician in the United States. We have the people who don’t do the work — they pretend. While they’ve learned to put on a good show, they lack understanding. They can’t answer questions that don’t rely on memorization. They can’t explain things without using jargon or vague terms. They have no idea how things interact. They can’t predict the consequences. The problem is that it’s difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.
- How To Distinguish Real Knowledge and Fake Knowledge. With journalists, it is more difficult. Some have acquired true knowledge.

Often they are veteran reporters who have specialised for years in a clearly defined area. They make a serious effort to understand the complexity of a subject and to communicate it. They tend to write long articles that highlight a variety of cases and exceptions. The majority of journalists, however, fall into the category of chauffeur. They conjure up articles off the tops of their heads or, rather, from Google searches. Their texts are one-sided, short, and— often as compensation for their patchy knowledge. The same superficiality is present in business. The larger a company, the more the CEO is expected to possess “star quality.” Dedication, solemnity, and reliability are undervalued, at least at the top. Too often shareholders and business journalists seem to believe that showmanship will deliver better results, which is obviously not the case. One way to guard against this is to understand your circle of competence. Dobelli concludes with some advice worth taking to heart. Be on the lookout for chauffeur knowledge. Do not confuse the company spokesperson, the ringmaster, the newscaster, the schmoozer, the verbiage vendor, or the cliché generator with those who possess true knowledge. How do you recognize the difference? There is a clear indicator: True experts recognize the limits of what they know and what they do not know. If they find themselves outside their circle of competence, they keep quiet or simply say, “I don’t know.” This they utter unapologetically, even with a certain pride. From chauffeurs, we hear every line except this.

III. Batesian Mimicry Problem. Batesian Mimicry: Why Copycats Are Successful.

Mimic and the Real Thing:

- A. "There's two kinds of snakes you come across. There's the Texas Coral Snake, and the Mexican Milk Snake, and they both look exactly alike. The Texas Coral Snake is dangerous, it's venomous, it can kill you in a minute. The Mexican Milk Snake can't do anything to you; it's an impostor." How is it that these two look alike? It's due to a phenomenon called Batesian Mimicry.
- B. In the 1850s, the naturalist Henry Walter Bates found a certain set of butterflies who were clearly *not* of the same species but whose wings looked almost the same to the naked eye. After thinking it over, Bates eventually figured out what was going on: While the butterflies which were toxic to potential predators (the "models") were able to operate freely and relatively unmolested, there had also developed a "mimic" population of butterflies which wasn't toxic at all, yet still went untouched! In fact, biologists eventually figured out that the more toxic and dangerous the "model" was and the more frequently they appeared in the local population, the easier it was for its "mimics" to get by! Predators simply wouldn't take the risk of mixing up the two. If there aren't as many "models" around or they aren't that dangerous, the mimics have a harder time.
- C. This is a wonderful model, and in the practical world we live in, a similar phenomenon abounds: Copycats or "pretenders to the throne" are often very effective, very convincing "mimics" of the true champions. They dress the part, they talk the talk, and they know what buttons to push. But in the end, they are merely chauffeurs. We see a very Batesian effect at work: The more impressive the "model," the more effective its mimics can be in convincing people they too are impressive, and in all the same ways. But for every Warren Buffett (just one by our count), there has been many "future" Warren Buffett's. For every Steve Jobs, there have been many "next" Steve Jobs'. In fact, sometimes even just *appearances* can be quite convincing: now-disgraced Theranos founder Elizabeth Holmes was very fond of wearing a very Steve Jobsian black turtleneck outfit. Because they can be very convincing, we must be wise enough to watch out for Batesian mimicry

— even in ourselves. This brings up an interesting, at times paradoxical, question: Who can best tell the difference between a Coral Snake and its Mimics? The Coral Snake itself. The real thing knows a fake. It's worth taking the time to work on learning all the big ideas you can find, not just the ones you want to learn. In that search, you'll find a host of big winners you didn't even know existed.

9. Preparation:

- A. While we all hold an opinion on almost everything. Have I do the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it?
 - I. I have to do the reading.
 - II. I have to talk to competent people and understand their arguments.
 - III. Never try to be biased toward any of the side, but question both side of the argument.
 - IV. Do not support any side, until all the facts are put out there, clear and obvious.
 - V. Once known all the facts then analyse both sides of the argument like William Lane Craig.
 - VI. I have to think about the key variables and how they interact over time.
 - VII. I have to listen and chase down arguments that run counter to your views.
 - VIII. I have to think about how you might be fooling yourself.
 - IX. I have to see the issue from multiple perspectives.
 - X. I have to think.
 - XI. I need to become your most intelligent critic and have the intellectual honesty to kill some of your best-loved ideas If The arguments are not supported by arguments and evidence..
 - XII. Be honest with yourself and open minded. ANALYSE both side of the argument logically and see which is true logically. Means has the clear terms, premises are true, and conclusion follows from premises.
 - XIII. Never say your opinion about anything that requires the analysis of the arguments and facts. Work very very hard to have an opinion about anything.

XIV.Listen very carefully other side and use ancient method *state the opposition argument in my own words and ask him/her if the argument I stated in my own words represents correctly their argument and if I UNDERSTOOD Correctly their arguments.

XV.Never use cheap shots to win argument, like logical fallacies.

XVI.Debate and discussion is not about just win at any cost, but let other person to think about your arguments and engage with them. Second reason never use in discussion cheap shots toward other person, but be civil. Third reason is win the debate and discussion. Fourth is find the truth.

B. For Affirmative and Negative Case:

- I. Read, analyse, Research, Syntopicon and Investigate Published Work.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading, deductive and inductive methodology..
 - Investigate Line of logic of My own Arguments
- II. Read Opponents Books, Articles, Newspapers, Blogs. Reading Published work. What objections he would raise against the topic and prepare the responses for each of these points.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of opponent Arguments.
- III. Watch Video. Watching Videos of the opponent. What objections he would raise against the topic and prepare the responses for each of these points.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of My own Arguments.
- IV. Listen The recording that the opposition made, in which he addresses these issues.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of My own Arguments.
- V. Talk with People who are students in his class, who can tell me, privately, insights into his thinking and character.
- VI. If that sounds like a lot of work, just say, “I don’t have an opinion on that; why don’t you tell me how you got to have such a firm one? It sounds like I could learn something.”
- VII. Another way to get smarter, outside of reading, is to surround yourself with people who are not afraid to challenge your ideas. “Develop into a lifelong self-learner through voracious reading; cultivate curiosity and strive to become a little wiser every day.”

10. **Compound Knowledge-** Are The Resources I will Choose Concentrating On the Expiring Information or Compound Knowledge?

- I. Are on the Resources providing expiring information?
 - A. Will you care about what you're reading in a month? In a year? In five years?
 - B. Are you focused enough on the same thing to build cumulative knowledge or are you too spread out?
 - C. What do you spend time on that's likely to change in the next few years? What's not likely to change?
 - D. What would need to happen for you to stop outsourcing organisation of information to the computer?
- II. Signs of The Information in the resources are expiring
 - A. First, it's marketed to you.
 - B. Second, lacking details and nuance, it's easily digestible. This is why it's commonly telling you what happened, not why it happened or under what conditions it might happen again
 - C. Third, it won't be relevant in a month or a year. Expiring information is one reason I stopped reading most news. It's a false map.
- III. While most of us focus on consuming information that we won't care about next month, let alone next year, focus on knowledge and companies that change very, very slowly or not at all. And because the information he was learning changed slowly he could compound his knowledge over time.
- IV. Doing his own thinking and vacuums up the details. When we don't think for ourselves it's easy to put the blame on someone else, to "pass the buck" so to speak.
- V. When we consume information that doesn't expire or expires slowly; is very detailed; and we spend time thinking about it not passing the buck, we can match patterns. This is how you learn to see what other people are missing. The longer you do this, the more advantage you get.
- VI. Just like the rest of us, Buffett's dependent on information and knowledge to make great decisions. Unlike most of us, he has a great memory—perhaps because he's not trying to outsource his memory or thinking to others.
- VII. A lot of what the snowball is about the concept of learning, and creating, and the advantage of having the information and knowing it. When I came here today one

of the things that I was thinking is that what you do is so much at the intersection, because retrieving information is different from having it already in your head.

VIII. What you do is different. You work on manipulating how you use the information.

In fact, Warren Buffett and Charlie Munger have the files in their head. That's why they aren't really out there googling all the time looking for, trying to look stuff up, because they already know it.

IX. I think a lot of the work that you do here is helpful to the ordinary person, but Warren Buffett or Charlie Munger don't need it. At the same time, the lesson that they have, which is that learning yourself, making yourself as smart as you can is extremely valid, and not just relying on a library where you can look something up all the time, because a lot of times when you need to make a decision, and you need 50 pieces of information, you need to know it then.

11. The Art of Anticipation of Objections.

- A. Analyse My Arguments, and Scrutinise The arguments by using Rules of Reading.
- B. Analyse the arguments of the opponent. Scrutinise Their arguments by using Rules of Reading.
- C. Analyse My own arguments. Scrutinise My own arguments, and the potential Loopholes in the argument by Use Rules of Reading.
- D. Use Think, Logic, Stratagem, Thinking models.
- E. Write.
- F. Prepare The responses to anticipated objections that, I think the opponent will bring up.
- G. Be intellectually Prepared. This means That I need to know my arguments, so well, that nothing new can surprise me. I would also invest lots of time in knowing and know better opposite side arguments. I would read both side of the arguments, and work Hard on analysing the arguments and evidence of both sides. Doing the work required to hold an opinion means you can argue against yourself better than others can. Only then can you say, "I can hold this view because I can't find anyone else who can argue better against my view." Great thinkers, like Charles Darwin, did the work. And it's one of the biggest reasons he's buried at Westminster Abbey. While we all hold an opinion on almost everything. Have I do the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it? If that sounds like a lot of work, just say, "I don't have an opinion on that; why don't you tell me how you got to have such a firm one? It sounds like I could learn something."
- H. Doing the work required to hold an opinion means you can argue against yourself better than others can. Only then can you say, "I can hold this view because I can't find anyone else who can argue better against my view." Great thinkers, like Charles Darwin, did the work. And it's one of the biggest reasons he's buried at Westminster Abbey.
- I. Doing the work counteracts our natural desire to seek out only information that confirms what we believe we know. When Darwin encountered opinions or facts that ran contrary to his ideas, he endeavored not only to listen but also not to rest

until he could either argue better than his challengers or understand how the fact fit. Darwin did the work. It's wasn't easy, but that's the point.

- J. Have the best work ethic on daily basis. This is everyday process, and try to figure it out, the strengths and weaknesses of my position and opposing person position, This leads to the True Confidence.
- K. As Per Kobe Bryant statement: Trivial things should not be taken your attention. The attentions should be focused on things that are very important. Anything outside of the most important things in life, you should not have time for. You Should love the challenge in life, and always be curious, if you can be at the top , as these greats in that area. Always focus on one thing and not multiple things, this gives an edge and advantage over other people, who focusing on multiple things in life. The World Becomes a library to you, to be better at your craft.: Everything you see whether TV show I saw, Books, Journals, I read, whether discussion, debate I listen, people I talk to. Everything was done to try to learn to become better at the craft you're focusing. When you have this point of view, then the world becomes your library to help you to become better at the craft.
- L. I Always need to ask myself: Have I done the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it? If that sounds like a lot of work, just say, "I don't have an opinion on that; why don't you tell me how you got to have such a firm one? It sounds like I could learn something."
- M. I might need to Suspend my judgement and tell them that I do not have an opinion on this specific Topic.
- N. Never Under Prepare, but Vastly Over Prepare for the Opponent and their arguments and responses
- O. Spend years in preparation, take debate class at the college or university. You need to participate in debates. You need to have mock debates, where someone play role of your opponent, and then you respond to them. You need to do reading and learn how to flow the debates. How to construct affirmative case and negative case. You need to take time to prepare and have enormous preparation.
- P. Memorize the arguments for my case

12. When Dialogue, Discussion, Debate Takes A Place.

A. As Affirmative Speaker, you need to present Prima Facie Case for proposition that is under debate. Prima Facie Case will be one that will establish the truth of proposition you are defending. If I am defending proposition that God Exist, I will want to give 3-5 arguments leading to that Conclusion, that God Exists, and then I will lay those out with great clarity in my opening speech, and say this is the groundwork for the debate. I am not interested in talking about other issues for example if Christianity bad for society Then, I come back to those in every speech over and over again. The goal is to make opponent argue on your grounds. You do not go over to his grounds, and let your audience forget, your affirmative case, rather you reorganise opponent speech, so that you answer his objections in so far as they reply to your arguments, so you may answer them in a very different order than he gave them, because you will be seeing for example: now what answer or response did he have to the cosmological argument, I see two basic responses and then you deal with them.

- Make Briefs, where I have suitable objection, and then have two or three responses to those objections.
- Use The Brief During Exchange with the Opponent. File these Briefs into Folders, and spread These Manila Folders out in front of me on Desk, When I am interacting with the Opponent. Once the opponent Rises his point I just pull These briefs from these folders and never have to think on my feet because I am completely prepared. Key is never have to think on the feet to be so well prepared, that I would have my responses ready for anything he brings up.
- Quote Peer Review Scientific Articles on the topic in support the conclusions.

B. Take Notes While the Opposition is speaking:

- How To Take Notes- Flow Chart. By Taking Notes, I am sure that I am responding to my opponent's arguments and everything he brings up.

I. Make 11-12 Columns on the Pad. Prepare the left column in advance of the communication, debate. The Left Column needs to be filled in, if you starting first. If not, then leave left column as blank.

II. First Left Hand Column Are My Arguments.

III. Second Left Hand Column are Opposition Arguments and Responses to My arguments.

IV. Third Left Column are My Responses to the Opponent responses.

V. Fourth Left Hand Column are My Rebuttal.

VI. Fifth Left Hand Column are Opponent Rebuttal.

VII. Sixth Left Hand Column are my Responses to the Opponent rebuttal.

VIII. Seventh Left Hand Column is the Final My Rebuttal.

IX. Eight Left Hand Column is The opponent Rebuttal.

X. Ninth Left Hand Column is my closing statements.

XI. Tenth Left Hand Column is the opponent closing statements.

XII. Eleventh Left Hand Column is the Cross Examination.

- My Answer.

- Opponent Answer.

- My response to the response of the opponent.

C. Always Remind the audience what are your three to five arguments and what are the responses of the opponent, if any to your arguments.

D. Always allow the opponent allow to lay out his argument without interruption.

E. Take the opponent arguments and put in my own words and correctly represent their argument carefully without misrepresentation.

F. Be Honest.

G. Be Open Minded.

H. Always from Your side be honest and rigorous exchange of arguments and counter Arguments from which me and opponent would benefit.

I. One of good technique is whenever you can quote an opponent against himself, this is powerful device. Have the manuscript, point to the footnote, cite the book, and the quotation and have the page number.

J. Never Take Cheap Shots at the Opponent.

- K. Encourage not just trust someone say so, but demand published peer reviewed articles in support of the positions that one take
- L. Always look at the reality of the situation, and do not let the emotion cloud the situation and the execution. Always be in the present and the moment.

*Step 31-Use The Chosen Rules of Reading
Method For Bible Study, Deep Work And
Follow Each Steps Of The Method Until
Finish All Steps,
And Follow Each Steps As many Times As
I Want, While Re-listen Lectures, Read
Books or Lecture Notes 1-1000 Times For
Each Step. Do It Correctly, Slowly,
Patiently, Methodically, Logically Take It
Time and Do Not Rush Process.*

SLOW READING- COMPLEX

TEXT-Bible Study, Deep Work, Deep Study

Method 1-Chapter Summary Method

Step 1-Tools Required for this Method

1. Cross Reference.
2. Treasure Scripture Knowledge.
3. BOOK
4. Read it in a Bible without notes. If you try using this method by reading a Bible in which you have made notes, you will have the tendency to concentrate on the same ideas. Let God speak to you in a fresh way and give you new insights.
5. Read it without stopping. During your first few readings, don't stop in the middle of a chapter, but read it from start to finish. Your goal is to feel the flow of the chapter, so don't be concerned with the details at the outset. Try to capture the central message and the writer's overall theme.
6. Read it in several different contemporary translations. This will give you additional insights as you see how each translator rendered the original writing. Make notes on the interesting differences you find.
7. Read it aloud quietly to yourself. If you have a problem with concentration, this will help tremendously because you will be hearing yourself read. Many people have found that reading aloud helps them better focus their attention on the text.

Step 2-Select A chapter Title

1. Record on chapter study chart the name of the book and chapter number you are studying.
2. Read the entire chapter and give it a title which reflects its content.

Step 3-Mark Paragraph Divisions

1. Mark the paragraph division within chapter.
2. If your Bible or Books has neither paragraph marks or bold face marking then you must determine the paragraph division your ourself.
3. Mark the paragraph division in you Bible by drawing a circle around the verse number where each paragraph begins.

Step 4-Create a Chapter Study Chart

1. On the chapter study Chart record the title of the chapter.
2. List the verse of the paragraph division.
3. Give each paragraph a title which reflects the content of that paragraph.
4. Use the column with the headings to record your thoughts about the relation between parts of the chapter.

Step 5-Create A Chapter Outline

1. Use paragraph divisions and paragraph titles for the main points.
2. Select sub-points and outline the verses in each paragraph of the chapter.
3. Record the verse number by points and sub-points.
4. Include any other Bible references which relate to the subject and explain it more fully.
5. If the number of the paragraphs exceeds the space on the chapter  form use additional forms.

Step 6-Content

1. Describe, summarise, paraphrase, outline, or make a list of the major points in a chapter. The method you choose will depend on the literary style of the chapter and on your own preference. Some people like to summarise; analytical people enjoy outlining. Choose the method with which you feel most comfortable and is easy for you to do. Don't try to interpret the chapter; just make observations on its contents. Record on your form what you feel the writer said.

Step 7-What Is Immediate Context of The Chapter?

Step 8- What Are The Facts Within Context Provided in The Chapter?

Step 9-Chief People

1. List the most important people in the chapter. Ask questions such as, Who are the main people in this chapter? Why are they included? What is significant about them? If the chapter contains pronouns (he, she, they, etc.) you may have to refer to the previous chapter to identify the people. Write down your reasons for choosing certain people as the chief ones of the chapter. When you come to long genealogies (lists of people), don't try to list each one, but summarise the list.

Step 10-Choice verse

1. Choose a verse that summarises the whole chapter or one that speaks to you personally. In some chapters you may find a key verse that summarises the writer's argument; in other chapters there may not be a key verse. On occasion you may want to pick a verse from which you will be writing your application, a verse that you believe God would have you apply to your life.

Step 11-Crucial Word/Words

1. Write down the key word or words of the chapter. Many times the key word will be the one that is used most frequently ("love" in 1 Corinthians 13 and "faith" in Hebrews 11). Sometimes the crucial word may be the most important word but not the most used one. In Romans 6, for example, the word "count" (kjv , "reckon") is the important word even though it is used only once (Rom. 6:11). Also, a chapter may have more than one crucial word.

Step 12-Challenges

1. List any difficulties you may have with the passage. Are there any statements you do not understand? Is there any problem or question you would like to study further? Often while doing a chapter summary you will get ideas for other types of studies you may want to do in the future. For instance, a certain word in the chapter may catch your attention. Take note of that word; later you may want to do an in-depth study of it (see chapter 7). A question about a doctrinal matter might motivate you to do a topical study on that particular teaching.

Step 13-Cross references

1. Using the cross-references in your study Bible, look up other verses that help clarify what the chapter is talking about and list them on your form. Ask the question, What else in the Bible helps me understand this chapter? Cross-references are important because they are helpful tools in interpreting the meaning of a chapter; they enable you to see what the Bible as a whole has to say on any given teaching. You can look for several types of cross-references, and these are described in the section on correlation in the Chapter Analysis Method (see chapter 10) and in chapter 10 of Walter A. Henrichsen and Gayle Jackson's book *Studying, Interpreting, and Applying the Bible*.

Step 14-Christ Seen

1. The entire Bible is a revelation of the person of Jesus Christ. In fact, Jesus used the Old Testament to teach his disciples about himself. On the day of resurrection on the Emmaus road, Jesus taught two of his disciples: "Beginning with Moses and all the Prophets, he explained to them what was said in all the Scriptures concerning himself" (Luke 24:27). As you study each chapter, be alert for statements that tell you something about Jesus Christ, the Holy Spirit, or God the Father. Ask yourself, What can I learn about the nature of Jesus from this chapter? What attributes of God in Christ are illustrated here? (Some examples: his love, justice, mercy, holiness, power, and faithfulness.) This step may be the most difficult to complete in some portions of the Bible, particularly in Old Testament narratives and in passages where symbolism is used.

Step 15-Central Lesson/Lessons

1. Write down the major principles, insights, and lessons you learn from this chapter. Ask yourself, Why does God want this passage in the Bible? What does he want to teach me from this chapter? What is the central thought the writer is trying to develop? A possible answer might be "We should be loving in all interpersonal relationships" (1 Cor. 13).

Step 16-Conclusion

1. This is the application portion of your study. As discussed in chapter 1, develop a project to help you implement in your life a lesson you have learned from the chapter or portion. It will benefit you to conclude your chapter summary by asking yourself two questions: (1) How do these truths apply to me personally and (2) What specifically am I going to do about them?

Step 17-What Further Analysis I Need To Do, Next Time?

Step 18-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a Book, bible portion to study, identify its subject and key verse and summarise its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 2 - Character Quality Method

Step 0-List of the Positive and Negative Characters Quality

1. Positive Characteristics to Look for in a Person.

- Honesty
- Integrity
- Dependability
- Loyalty
- Dedication
- Faithfulness
- Trustworthiness
- Sincerity
- Diligence
- Orderliness
- Righteousness
- Fairness
- Obedience
- Courteousness
- Respectfulness
- Reverence
- Deference
- Gratefulness
- Thankfulness
- Wisdom
- Discernment
- Sensitivity
- Perspective
- Discreetness
- Carefulness
- Cautiousness
- Discipline
- Thriftiness
- Good Stewardship

- Resourcefulness
- Observer
- Industry
- Creativity
- Enthusiasm
- Positiveness
- Lovingness
- Kindness
- Patience
- Self-denying
- Self-giving
- Sacrificing
- Compassionate
- Meekness
- Sympathy
- Generosity
- Forgiveness
- Gentleness
- Mercifulness
- Peacemaking
- Submissiveness
- Agreeableness
- Considerateness
- Self-control
- Wholeheartedness
- Determinate
- Stableness
- Energy
- Zealousness
- Earnestness
- Balance
- Moderateness
- Chasteness
- Pureness
- Cleanliness

- Modesty
- Cheerfulness
- Optimism
- Confidence
- Boldness
- Courageousness
- Man of Faith
- Bravery
- Durableness
- Humbleness
- Calmness
- Quietness
- Independence
- Tolerance
- Contentedness
- Uncomplaining
- Flexibleness
- Uncompromising
- A Servant
- Sense of Humour
- Characterised by the Beatitudes

2. Negative Characteristics and Sins to Look for in a Biographical Study

- A liar
- Unfaithful
- Unreliable
- Libellous
- Slanderer
- Gossiper
- Backbiter
- Compromising
- Flatterer
- Lazy
- A Sluggard
- Shallow
- Hypocritical
- Crafty/Sly
- Deceitful
- Dishonest
- Unfair
- Insulting
- Coarse
- Rude/Gross
- Impolite
- Rebellious
- A Busybody
- Tyrannical
- Disobedient
- Ungrateful
- Murmurer
- Shortsighted
- Lukewarm
- Halfhearted
- Foolish
- Talkative
- Idolatrous
- Careless

- Forgetful
- Wasteful
- Cruel
- Inhuman
- Selfish
- Malicious
- Unkind
- Insensitive
- Negligent
- Callous
- Prejudiced
- 261
- Unforgiving
- Harsh
- Unsociable
- Grudging
- Annoying
- Irritating
- Indifferent
- Apathetic
- Idle
- Cowardly
- A Cop-out
- Impulsive
- Humorless
- Fickle
- Double-minded
- Wavering
- Headstrong
- Proud
- Conceited
- Stubborn
- Boastful
- Sensual
- Immodest

- Gluttonous
- A Drunkard
- Reprobate
- Immoral
- Unclean
- Adulterous
- Fornicator
- Covetous
- Greedy
- Stingy
- Fearful
- Arrogant
- Dogmatic
- Vain
- Jealous
- Envious
- Sarcastic
- Scornful
- Blasphemous
- Bitter
- Violent
- Complaining
- Procrastinator
- Argumentative
- Disrespectful
- Manipulative
- Bigoted
- Worldly
- A Worrier
- Rejoices in Evil
- Lusts for Power
- Self-righteous
- Undisciplined
- Apostate
- Fears Men

- Presumptuous
- Profane
- Legalistic
- Doctrinally Off
- Friend of the World
- Angry without Cause
- Ashamed of Christ
- A Doubter
- Independent Spirit
- Loves Men's Praise
- Forgets God

Step 1-Tools Required for this Method

1. Book
2. Study Bible
3. An Exhaustive Concordance
4. The Building of Character by J. R . Miller (AMG Publishers)
5. Character Sketches, 2 volumes (Institute of Basic Life Principles)
6. The Master Bible, edited by J. Wesley Dickson (J. Wesley Dickson & Co.)
7. The Measure of a Man by Gene Getz (Regal Books)
8. The Measure of a Woman by Gene Getz (Regal Books)
9. Bible Dictionary
10. Word Study Book
11. Topical Bible
12. Cross Reference
13. Treasure Scripture Knowledge
14. An English dictionary
15. Only work on one quality at a time. Don't try to work on two or three or more, for it takes concentrated effort to see how that one quality applies to every area of your life. It is far better to build one quality solidly into your life than to work on several weak ones.
16. Don't rush it! Character development takes time. Even though one of the steps is writing out an illustration after one week, you should probably want to work on one quality for a much longer time. I have found in my own life that God works on an area for months (sometimes years) before it becomes part of my daily walk with him.
17. Stay with that one quality until you get victory in that specific area. Don't skip around, trying to work on many qualities, when you need victory in that one. Remember that the quality of diligence is one you want to work on.
18. Be alert to a negative quality in your life that is actually a positive one being misused. Realise that the Lord wants to turn your weak points into strong ones. If you are rigid, legalistic, and unbending, it might be that the quality of self-discipline is being misused. That discipline needs to be tempered with compassion and concern for others.
19. Trust the Holy Spirit to build these qualities in your life. In the final analysis, it is God's power in you that reproduces the fruit of the Spirit in your life. It is God alone who can change your character. "For it is God who works in you to will

and to act according to his good purpose” (Phil. 2:13). So let God do it, trusting the Holy Spirit to work in your life.

Step 2 Name the Quality

1. Select the quality you want to study and write it down. Then look it up in an English dictionary and jot down the definition of that word or concept. List any synonyms or related words that help you understand this quality.

Step 3-Name the Opposite Quality

1. Write down the opposite quality — the antonym — of the one you are studying, and write out its dictionary definition and similar words. If you can’t think of the opposite, use a dictionary of antonyms; some thesauruses also give antonyms. For example, unfaithfulness is the opposite of faithfulness. But in some qualities you might be studying, there might be two or more opposites. For example, you could have the following:
 - Faith and doubt.
 - Faith and apathy.
 - Faith and fear.

Step 4-Do a Simple Word Study

1. Look up the definition of the quality you are studying. Find the ways it is used in the scriptural contexts; then check a Bible dictionary, encyclopaedia, or word study book for the way the quality was used in biblical times and in the Scriptures. Some of the tools will tell you how many times the word is used in the Bible, each testament, the writings of different authors, and in the book you are studying. For example, if you were studying the quality of meekness, you would discover that the word meek in the original Greek meant “breaking something and bringing it under submission.” The word was used to describe the training of valuable horses, which were brought under submission to their masters. A stallion would still have all the power and strength of its wild days, but it was now under its master’s control. Meekness, therefore, is not weakness. As a Christian character quality, meekness is strength that is in submission to Jesus Christ.

Step 5-Find Some Cross References

1. Using cross-references will give you additional insights from other portions of the Bible. Scripture is still the best interpreter of Scripture. Use your concordance and topical Bible to find all the verses you can relating to this quality. Look up the word and its synonyms in the concordance and topical Bible, write the cross-reference on the form in the appropriate section, and give a brief description of that verse. Then ask some of the following questions about the quality you are studying as you meditate on the cross-reference verses:
 - What are the benefits this trait can bring me?
 - What are some bad consequences this trait can bring me?
 - What are benefits this trait can bring to others?
 - What are some bad consequences this trait can bring to others?
 - Is there any promise from God related to this trait?
 - Is there any warning or judgment related to this trait?
 - Is there a command related to this trait?
 - What factors produce this trait?
 - Did Jesus have anything to say about this quality? What?
 - What writer talked about this quality the most?
 - Is this trait symbolised by anything in Scripture? Is that significant?
 - Is this trait listed with a group of qualities? What is the relationship between them? What does this suggest?
 - What Scriptures tell me directly what God thinks of this trait?
 - Do I want more or less of this trait in my life?
2. After asking a series of questions such as these, or others that you think of, you might write a brief summary of the Bible's teaching on this quality. You may list any lessons or principles that you learned from this mini-topical study, or you may paraphrase a few key verses on this trait. Always be sure to write down any difficulties you have with the verses you looked up, or questions you would like to see answered. Possibly, later on you will understand what is difficult at present and then find answers to your problems; often one verse sheds light on another verse you have studied.

Step 6-Do a Brief Biographical Study

1. Now go back to your Book or Bible and try to find at least one person (more if possible) who showed this character quality in his or her life. Briefly describe this quality and write down the Scriptures that refer to it. Ask these questions as you do this part of the study:
 - What shows this quality in his/her life?
 - How did this quality affect his/her life?
 - Did the quality help or hinder his/her growth to maturity? How?
 - What results did it produce in his/her life?
2. An example of this step may be seen in the life of Joseph, the son of Jacob, who displayed different qualities of the fruit of the Spirit (Gal. 5:22 – 23) in each incident in his life. It is interesting to note his testimony before the heathen: “So Pharaoh asked them, ‘Can we find anyone like this man, one in whom is the spirit of God?’” (Gen. 41:38). We find these qualities in Joseph:
 - He displayed love in a difficult family situation (Gen. 47).
 - He displayed self-control in a difficult temptation (Gen. 39).
 - He displayed industry and patience in difficult circumstances (Gen.39:19 – 40:23).
 - He displayed faithfulness in a difficult task (Gen. 41:37 – 57).
 - He displayed goodness, gentleness, and kindness in difficult family reunions (Gen. 42; 50).

Step 7-What Is Immediate Context

Step 8- What is Whole Context

Step 9- What Are The Facts Within Context

Step 10-Find a Memory Verse

1. Write down at least one verse from your cross-reference or biographical portion of the study that really speaks to you and that you intend to memorise during the following week. This verse should come in handy when God provides an opportunity for you to work on this character quality in a specific way.

Step 11-Select a Situation or Relationship to Work on

1. We are now getting to the application part of the study. Think of an area in your life in which God wants you to work on this character quality — avoiding it if it's negative or building it up if it's positive. This can be either a situation or an interpersonal relationship. If it is a situation, anticipate in advance what you will do when the situation arises. Suppose you have been slothful, lazy. Your study on slothfulness has challenged you to get rid of this quality in your life. As you plan ahead, you know when situations will arise that will bring out the lazy streak in you, so you decide ahead of time what you will do: You will set two alarm clocks, one on the far side of the room, to help you get up in the morning to have a quiet time and be on time to work or school. If it is a relationship, determine ahead of time how you will respond in your interactions with that person. This person could be wife, husband, parents, children, girlfriend, boyfriend, work associates, school friends, or neighbors. Look for opportunities to work on that character quality in your relationships with that person or persons. Your goal is to have more mature relationships. One way of doing this is to think back and recall a good situation or relationship in your recent past when you did work on this quality.

Step 12-Plan a Specific Project

1. This is the practical part of your application and is the actual working out. Think of a project that you will work on to build a positive quality in your life or to get rid of a negative quality. Once I was working on the trait of gratefulness. One of my projects was to write grateful letters to five people who had been a blessing to me, saying, "I am grateful for you because. . . ." Remember: applications should be personal, practical, possible, and measurable.

Step 13-Write out Personal illustration

1. A few days after you have completed the first eight steps of this study, write out an illustration of how you were able to work on this quality. This is the “provable” (measurable) part of your application. Be specific, and write down where you have succeeded and where you might have failed. In just a short time you should be able to develop a whole set of personal examples of how God is working in your life, getting rid of negative qualities and building positive ones. These illustrations serve a number of purposes. When you get discouraged, read over the backlog of your illustrations and see how God has worked in you. When you are working with a “Timothy,” use your illustrations to teach him and to encourage him in his own illustrations. When you are sharing your testimony or teaching a class, use these illustrations to add a personal element to your presentation: “Here is how God worked in my life.” God often builds character in our lives by putting us in situations where we are tempted to do the opposite. For example, God may teach you honesty by placing you in a situation where you are tempted to be dishonest.

Step 14-What Further Analysis or Research I Need To Do, Next Time?

Step 15-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarise its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 3-Thematic Method

Step 1-Tools Required for this Method

1. Book
2. Study Bible
3. An Exhaustive Concordance
4. A topical Bible
5. You don't need many reference tools. You can do a limited study if you have only a topical Bible. But a topical Bible does not list all the references on a particular theme, so you will benefit by using an exhaustive concordance. You can make a list of every word that relates to the theme, then look up each word in the concordance and select the verses that deal specifically with your theme.
6. You can use this method when you don't have the time to do a full-scale topical study because the subject is too broad or because of the large number of Bible references on the subject.
7. This method is a good way to preview a topic by surveying the high points of its subordinate themes before attempting a regular topical study of the subject. Or you can use this approach when you are only interested in having certain questions answered on the theme. With this method you can discover exactly what you want to find out without spending valuable time on unrelated matters.
8. This method is one of the easiest types of personal Bible study to turn into a sermon or Sunday school lesson. After completing your personal study, make each of your questions a major point in your talk and share the biblical answers with your group, class, or congregation.
9. This method is a good one for teaching your "Timothy" or any new Christian. It is simple enough for someone who has not yet done any personal Bible study to grasp and do effectively.

Step 2-Choose a Theme to Study

1. Select a theme in which you are interested. If this is your first study of this kind, start with one that is small or short. In the Assignment section are some suggestions, including the questions; the example gives you a completed study.

Step 3-List all the verses you intended to study

1. Using your three tools — the study Bible, the exhaustive concordance, the topical Bible — make a list of all the Scripture verses that are related to the theme you have chosen. Remember to consider synonyms and other similar words and concepts when using the concordance. Select from this list the verses that are most important to your theme (unless you are trying to discover all the Bible says about your theme).

Step 4-Decide on the Questions you will ask

1. How do you know what questions to ask? Write down those in which you are most interested. What are some things you would like to know about your theme? Make a list of questions, not more than five in number. Remember that sometimes you may need to ask only one question. Write your question(s) on the form or on a blank sheet of paper.
 - Who?
 - What?
 - When?
 - Where?
 - Why?
 - How?
 - What are the things God hates?
 - According to the New Testament, what things should we “endure”?
 - What are the things we should “consider” as Christians?
 - What traits of a fool are given in the book of Proverbs?
 - According to Solomon (in Proverbs), what brings poverty?
 - What are the characteristics of an angry man?
 - What causes anger?
 - What are the results of anger?
 - What is the cure for anger?

Step 5-Ask your Questions of each reference

1. Read through your references, and ask your set of questions of each verse. Write down the answers you find in the appropriate places on your form or paper. Sometimes you will be able to answer all the questions in a given verse, but usually you will only answer part of them. Occasionally a verse may not answer any of your questions; in that case, leave that part blank on your form. If you are not finding any answers to your questions, start over and write a new set of questions.

Step 6-What Is Immediate Context?

Step 7- What is Whole Context?

Step 8- What Are The Facts Within Context?

Step 9-Draw some conclusion from your study

1. After you have finished checking the references and writing your answers, go back and summarise the answers to each of your questions. You might organise your study into an outline by grouping similar verses together and turning your questions into the major divisions of the outline. This will make it easy for you to share the insights you have discovered with others.

Step 10-What Further Analysis or Research I Need To Do, Next Time?

Step 11-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.

Method 4 - Biographical Method

Step 1-Tools Required for this Method

1. Book
2. Study Bible
3. Exhaustive concordance
4. Topical Bible
5. Bible Dictionary or Encyclopaedia
6. Start with a person on whom you can do a simple study. Begin with one about whom there is a small number of references. Some biblical people can be studied in a few hours; others take weeks to study, and some major persons can take a lifetime. Do not start doing this study on a person such as Jesus, Moses, or Abraham. Begin with some minor but important people such as Andrew, Barnabas, or Mary of Bethany.
7. The secret of a good biographical study is to live with that person during the study. Walk in his or her sandals. Try to get inside their mind and see how they think, feel, and respond to circumstances. Attempt to see things from their point of view, hear with their ears, mingle with their friends, and fight with their enemies. Become that person while you are studying them. This is only possible if you spend much time with that person, reading, and rereading all the Bible references about them. A friend of mine, Wayne Watts, has spent a lifetime studying Abraham. He has studied this biblical person so long that he has taken on many characteristics of Abraham. He is a great man of faith, as Abraham was.
8. Be careful not to confuse different people who have the same name when you look up the references about them. You will have to be sure that the verse is speaking about the person you have chosen to study. You would not want to confuse John the Baptist with John the Apostle or John Mark. For example, the Bible shows us that the following names were popular and refer to different people:

- Zechariah — 30 different men
 - Nathan — 20 men
 - Jonathan — 15 men
 - Judas — 8 men
 - Mary — 7 women
 - James — 5 men
 - John — 5 men
9. Be careful to find the various names that may apply to just one person. Since the Bible came out of a Hebrew-Aramaic-Greek context, some people's names changed in the different languages, in both the Old Testament and the New. The apostle Peter, for example, is known as Peter, Simon, Simeon, and Cephas. Daniel's three friends, Hananiah, Mishael, and Azariah, are better known as Shadrach, Meshach, and Abednego. Sometimes a name change came because of a character change, which was the case of Jacob becoming Israel. So be careful and find all the names used for the same person in your Bible study.
 10. Stay away from books written about biblical people until after you have exhausted every Bible reference about that person and have drawn every possible insight out of those texts. Don't let a Bible commentary rob you of the task of personal discovery or prejudice your views of a person. Do your own work first, then check other sources.

Step 2-Select the Person You want to Study

1. You might start out by selecting someone who either has a weakness that you have or a strength that you would like to develop. Choose a person whose life will give you some valuable insights into how you can conform more to God's standard for living and become more like Jesus Christ.

2. Major Men in the Bible or other major Men.

- Abraham
- Daniel
- David
- Elijah
- Elisha
- Ezekiel
- Ezra
- Isaiah
- Isaac
- Jacob
- Jeremiah
- Jesus
- John (Apostle)
- Joseph (O.T.)
- Joshua
- Moses
- Nehemiah
- Paul
- Peter
- Pharaoh
- Samson
- Samuel
- Saul (O.T.)
- Solomon

3. Minor But Important Men in the Bible or other major Men.

- Aaron
- Abel
- Abimelech
- Abner
- Absalom
- Achan
- Adam
- Ahab
- Ahithophel
- Amos
- Ananias
- Andrew
- Apollos
- Apostles (any)
- Aquila
- Asa
- Balaam
- Barnabas
- Barzillai
- Caiaphas
- Caleb
- Eli
- Esau
- Gehazi
- Gideon
- Habakkuk
- Haggai
- Haman
- Herod
- Hezekiah
- Hosea
- Jabez
- James
- Jehoshaphat

- Jeroboam
- Joab
- Job
- John the Baptist
- Jonah
- Jonathan
- Judas Iscariot
- Judges (any)
- Kings (any)
- Laban
- Lot
- Luke
- Mark
- Matthew
- Melchizedek
- Mephibosheth
- Mordecai
- Naaman
- Nathan
- Noah
- Philemon
- Philip
- Pontius Pilate
- Prophets (any)
- Rehoboam
- Shamgar
- Silas
- Stephen
- Timothy
- Titus
- Tychicus
- Uzziah
- Zechariah
- Zedekiah
- Zephaniah

- Zerubbabel

4. Prominent Women in the Bible And other Women.

- Abigail
- Abishag
- Anna
- Bathsheba
- Deborah
- Delilah
- Dinah
- Dorcas
- Elizabeth
- Esther
- Eunice
- Eve
- Hagar
- Hannah
- Jezebel
- Jochebed
- Leah
- Lydia
- Martha
- Mary (Jesus' Mother)
- Mary Magdalene
- Mary of Bethany
- Michal
- Miriam
- Naaman's Maid
- Naomi
- Priscilla
- Queen of Sheba
- Rachel
- Rahab
- Rebekah
- Ruth

- Sapphira
- Sarah
- The Shunammite
- Vashti
- Zipporah

Step 3-Make a list of all the references about that person

1. Using your reference tools, find all the Scripture passages you can about that person and things related to her life. This might include such things as her birth, major events of her life, her accomplishments, what others said about her, and her death. You will not be able to get all the necessary “vital statistics” about every person you study, but find out as much about them as you can. Also look up any references that deal with the historical background of her life. If you were studying Esther, you would need to study the background of her day: the Persian Empire. If you were studying the apostle Paul, you would have to study his missionary journeys.

Step 4-Write down first impressions (First reading)

1. Read through the Scripture references you have listed and make some notes. Write out the first impression you have of this person. Then write down some basic observations and important information you discover about him or her. Finally, list any problems, questions, or difficulties you wonder about as you read these references.

Step 4-Make a Chronological Outline (Second Reading)

1. For a major biblical person, read all the references again and make a chronological outline of the person’s life. This will help you gain a good perspective on his life, and you will see how different events relate to one another. Later, when you study the events associated with his life, you will know in what part of his life they occurred. For minor biblical people or those about whose lives few details are given, read the references and make an outline on the basis of the information you have. Try to read all the references in one sitting and in a modern translation. This will help you feel the flow of the person’s life. As you read, look for any natural, major divisions in his or her life. Then look for and write down any progressions and changes of attitude in that

person's life as times goes by. For example, a well known division of Moses' life is.

- Forty years in Pharaoh's court — learning to be a somebody.
 - Forty years in the Median desert — learning to be a nobody.
 - Forty years in the Sinai desert — learning that God is Somebody.
2. This is a real key to studying the characters of the people involved. See how God slowly molded and changed the people or how Satan brought them down.

Step 5-Get some insights into the person (Third Reading)

1. Go back over the references again, and look for possible answers to the questions suggested in appendix B. By answering some of these questions, you should get some helpful insights into the character of the person you are studying.

Step 6-Identify some Character Qualities (Fourth Reading)

1. As you review the references once again, use the suggested list of positive and negative characteristics in appendix C as a checklist. Write on your form or paper each quality, good and bad, that shows up in the person's life. Give a verse reference that shows each characteristic you have observed.

Step 7-Question to ask (Fifth Reading)

1. Reputation

- Who wrote what we know about this person?
- What did people say about him? What did his friends say about him?
- What did his enemies say about him?
- What did his family (wife, children, brothers, sisters, parents) say about him?
- What did God say about him?
- Why do you think God allowed this person to be mentioned in the Bible?

2. Tests of Character

- What were his aims and motives?
- What was he like in his home?
- How did he respond to failure? Did he get discouraged easily?
- How did he respond to adversity? Did he handle criticism well?
- How did he respond to success? Did he get proud when praised?

- How did he respond to the trivial and mundane things in life? Was he faithful in the little things?
- How quickly did he praise God for the good or bad things that happened to him?
- How quickly did he obey God when told to do something?
- How quickly did he submit to God-ordained authority?
- What was he like when he was alone with God?

3. Background

- What can you discover about his family and ancestry?
- What does his name mean? Why was he given that name? Was it ever changed?
- What was his home-life like? How was he raised? Where was he raised?
- What were the characteristics of his parents? How did they influence him?
- Was there anything special about his birth?
- Where did he live? What was his everyday life like?
- Was he exposed to other cultures? Did they affect him in any way?
- What was the condition of his country politically and spiritually during his lifetime?
- What kind of training did he have? Did he have any schooling?
- What was his occupation?
- How long did he live? Where did he die? How did he die?

4. Significant Events

- Was there any great crisis in his life? How did he handle it?
- What are the great accomplishments for which he is remembered?
- Did he experience a divine “call”? How did he respond to it?
- What crucial decisions did he have to make? How did they affect him? Others?
- Did any particular problem keep recurring in his life?
- Where did he succeed? Where did he fail? Why?
- How did the environment and circumstances affect him?
- What part did he play in the history of God’s plan?
- Did he believe in the sovereignty of God? (God’s control over all events) Relationships?

- How did he get along with other people? Was he a loner? Was he a team person?
- How did he treat other people? Did he use them, or serve them?
- What was his wife like? How did she influence him?
- What were his children like? How did they influence him?
- Who were his close companions? What were they like? How did they influence him?
- Who were his enemies? What were they like? How did they influence him?
- What influence did he have on others? On his nation? On other nations?
- Did he take care of his family? How did his children turn out?
- Did his friends and family help or hinder him in serving the Lord?
- Did he train anyone to take his place? Did he leave a disciple (a "Timothy") behind?

5. Personality

- What type of person was he? What made him the way he was?
- Was his temperament choleric, melancholic, sanguine, or phlegmatic?
- What were the outstanding strengths in his character? What traits did he have?
- Did his life show any development of character as time passed? Was there growth and progression there?
- What were his particular faults and weaknesses?
- What were his particular sins? What steps led to those sins?
- In what area was his greatest battle: lust of the flesh, lust of the eyes, or pride of life?
- What were the results of his sins and weaknesses?
- Did he ever get the victory over his particular sins and weaknesses?
- What qualities made him a success or failure?
- Was he in any way a type of Christ? Spiritual Life
- What personal encounters did he have with God that are recorded in Scripture?
- What was his purpose in life? Did he try to bring glory to God?
- What message did he preach and live? Was his life a message for or against Christ/God?
- Did he live a separated life, distinct from worldly ways?

- What did he believe? What great lessons did God teach him?
- Why do you think God dealt with him the way he did?
- What was his attitude toward the Word of God? Did he know the Scriptures existing at that time?
- What kind of prayer life did he have? Did he have close fellowship with God?
- Was he bold in sharing his testimony? Was he a courageous witness in times of persecution?
- How big was his faith in God? How did he show it? Did God give him any specific promises?
- Was he a good steward of what God had given him — time, wealth, talents?
- Was he filled with the Spirit? What were his spiritual gifts? Did he use them?
- Was he eager to do God's will, willingly and without question?

Step 8-What Is Immediate Context?

Step 9- What is Whole Context?

Step 10- What Are The Facts Within Context?

Step 11-Show how other Bible truths are illustrated in the Person's Life

1. Examine the person's life to see how it illustrates other truths taught in the Bible. For example, does his or her life show the principle of "you will reap what you sow"? Look in that life for illustrations of some of the Proverbs or of principles taught in the Psalms. For instance, you might ask, "Does his life illustrate the promise, 'Delight yourself in the Lord and he will give you the desires of your heart' " (Ps. 37:4)? Find cross-references that illustrate what the Bible says about some of the characteristics you found in this person's life.

Step 12-Summarise the main Lesson (s)

1. In a few sentences write out what you think is the main lesson that is taught or illustrated by this person's life. Is there any one word that could describe that life? What was his or her outstanding characteristic?

Step 13-What Further Analysis or Research I Need To Do, Next Time?

Step 14-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summaries the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 15-Make Study Transferable

1. Condense what you have learned into a simple outline that will help you remember it and enable you to share your conclusions with others. Make it “pass-on-able.” Ask yourself “What can this person’s life mean to others? What can I share that I have learned that would help someone else?” Divide the information into natural sequences of time and/or events and lessons learned. Use the progressions that you have found and recorded. Then think of some easily remembered ways to title each section. Keep these titles true to the major content of each section, making use of rhymes, alliterations, and other memory devices. Use your imagination in this last step! An illustration of a transferable outline of the life of Barnabas might look like this:

- He was an investor of money in the lives of church members (Act 4:36–37).
- He was the introducer of Saul (later Paul) to the apostles (Acts 9:26 – 28).
- He was the inspector of the new church at Antioch (Acts 11:22 – 24).
- He was an instructor of new Christians, including Paul and Mark (Acts 11:22 – 26; 15:39).
- He was the initiator on the first missionary journey, which he began as the team leader but ended as a team member (Acts 13 – 14).
- He was an interpreter of the doctrine of salvation and God’s plan for the Gentiles (Acts 13 – 14).
- He was insistent in giving Mark another chance to be trained in the gospel ministry (Acts 15:36 – 39).

Step 16-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 5-Topical Method

Step 1-Tools Required for this Method

1. Book.
2. Study Bible
3. Exhaustive concordance
4. Topical Bible
5. Thompson Chain Reference Bible
6. Dickson's New Analytical Study Bible
7. Zondervan Dictionary of Bible Themes
8. NIV Thematic Study Bible
9. It enables us to study the Word of God systematically, logically, and in an orderly manner.
10. It gives us a proper perspective and balance regarding biblical truth. We get to see the whole of a biblical teaching.
11. It allows us to study subjects that are of particular interest to us.
12. It enables us to study the great doctrines of the Bible.
13. It lends itself to good and lively discussions. The results of a topical study are always easy to share with others.
14. It allows us variety in our lifetime commitment to personal Bible study. The number of topics in the Bible that we can study is almost limitless.
15. Be systematic. Don't try to study the Bible in a haphazard manner that is basically undisciplined. Make a list of all the things related to your topic, and make it as comprehensive and complete as possible. Then take up these items one at a time, studying them in a systematic and logical order.
16. Be thorough. As far as possible, find and study every verse that relates to the topic. The only way to know everything God has said on a topic is to go through the entire Bible and find all the passages on that topic. Use your concordance to do this.
17. Be exact. Try to get the exact meaning of every verse you study. Be sure to examine the context of each verse to avoid misinterpretation. The biggest mistake you must avoid is taking a verse out of its context.

Step 2-Select a Topic

1. You may choose a general subject, for example, all of the miracles in the Bible. You may select a more specific subject such as the miracles performed by Jesus or the miracles recorded in a certain book of the Bible. For your first study it is best to limit the topic to a specific subject in one book rather than study a subject in the entire Bible. You may select a topic which pertains to a need in your own life. You might select a topic about which you have been asked and could not answer or a topic which you do not fully understand. You may want to study topics you can use in counselling others in time of need. For example, you may want to study the topic of death so you will know how to comfort others. Or you may want to study fear so you can help those who are fearful.

Step 3-Compile A list of Words

1. Make a list of all the related words (synonyms and antonyms), phrases, events, and anything else that could have something to do with your topic. If you are studying suffering, for example, you will want to list words such as affliction, anger, chastisement, grief, health, pain, sorrow, trials, and tribulation. If you see that your topic has become too broad, narrow it down to a manageable size.

Step 4-Collect Bible References

1. Take your reference tools and begin to gather all the verses you can find on the topic. Look up in your concordance each related word listed in Step One. Make a list of all verses that relate in any way to the topic. Also, you will want to use your topical Bible to find verses for study.

Step 5-Consider Each Reference individually

1. Using the Comparison Chart at the end of this chapter, look up, read, and study each individual reference and write down your observations and insights on it. (You will use the Comparison Chart for both Step Three and Step Four.) Be sure to check the context (surrounding verses) carefully when studying a verse, to make sure you are interpreting it correctly.
2. Ask as many questions as you can about each verse you study. Remember to use the great what, why, when, where, who, and how questions. Don't forget to define all key words you come across.

Step 6-Compare and group the references

1. After you have carefully studied all your verses individually, you will begin to notice that some of the references naturally complement each other and deal with the same areas of the topic under study. Categorise these references on a piece of scratch paper.

Step 7-Condense Your Study into an Outline

1. Using the categories from Step Four, logically arranged as your main divisions, outline your study. Do this by grouping related or similar references together into natural divisions. Then organise these divisions into a logical pattern. In helping you organize your study, this step will also enable you to share it with others.

Step 8-What Is Immediate Context?

Step 9- What is Whole Context?

Step 10- What Are The Facts Within Context?

Step 11-Summarise the Information

1. After you gather all the information on a topic you will probably have a long list of Scriptures. You must now organise these verses to make the subject easily understood. Study the verses you collected. Identify main points made by the verses. What other verses make this same point? Arrange these verses together, then create a chart or outline to summarise your studies. Remember: You not only want to learn all the Bible teaches.

Step 12-Conclude Your Study

1. In your two-part conclusion, summarise your findings in a brief paragraph and then write out a practical application drawn from this summary. Remember to be personal and practical, writing a possible and measurable application.

Step 13-What Further Analysis or Research I Need To Do, Next Time?

Step 14-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 15-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 6-Word Study Method

Step 1-Tools Required for this Method

1. Books.
2. Study Bible
3. Exhaustive concordance
4. Several recent translations. (These will enable you to see the words different translators chose from the original ones. Do not use paraphrases in this study.)
5. A Bible dictionary and/or encyclopaedia.
6. A set of word studies (see the Introduction to this book).
7. A good English dictionary.
8. Topical Bible
9. The Complete Word-Study Dictionary of the Old Testament by Eugene Carpenter (AMG)
10. Gems from the Original by Harold J. Berry (Back to the Bible Broadcast)
11. The New International Dictionary of New Testament Theology: Abridged Edition, edited by Verlyn Verbrugge (Zondervan)
12. New Testament Words by William Barclay (Westminster John Knox)
13. A Theological Word Book of the Bible, edited by Alan Richardson (Macmillan)
14. A Theological Word Book of the Old Testament, edited by Laird Harris et al. (Moody Press)
15. Vincent's Word Studies in the New Testament by Marvin R. Vincent (Hendrickson)
16. If you have had some Greek, The Englishman's Greek Concordance of the New Testament (Zondervan) will be useful.
17. The Word Study Concordance and its companion volume The Word Study New Testament by Ralph Winter (William Carey Library).
18. The Word Study Method of Bible Study takes a microscopic look at the origin, definition, occurrences, and uses of a particular word, especially as it relates to the context of a passage of Scripture. The purpose is to learn as precisely and comprehensively as possible what the biblical writer meant by the word he used.
19. Sometimes several Greek words are translated by just one English word. We have already noted that the English word servant has seven Greek

equivalents, each with a different shade of meaning. Be sure to check your concordance carefully to see if this might be true of the word you are studying. Find out what each different original word meant.

20. Sometimes one Greek or Hebrew word is translated several ways in English.

To overcome this difficulty you will have to do a careful study on all the different renderings of that original word. You can do this quite easily through the use of your exhaustive concordance. For example, the Greek word *koinonia* is translated five different ways in the King James Version: (1) “communication” — once; (2) “communion” — 4 times; (3) “contribution” — once; (4) “distribution” — once; and (5) “fellowship” — 12 times. Follow this procedure in solving this difficulty:

- List the different ways the word is translated.
- List how many times it is translated each way.
- Give examples of each translation (if possible).
- Write down how the different meanings might be related.
- Determine if the writer of the book is using the word you are studying in single sense or is giving it a multiple meaning.

21. Sometimes an original word is translated by a whole phrase in English. This difficulty will take a little more work to overcome because concordances do not list word translations by phrases. You will have to compare the recent versions of the Bible you are using to see how the various translators have rendered the word. For example, Paul declared to the Corinthians, “But we all, with open face beholding as in a glass the glory of the Lord, are changed into the same image from glory to glory, even as by the Spirit of the Lord” (2 Cor. 3:18 KJV). The phrase “beholding as in a glass” is just one word in the original Greek (*katoptrizomenoi*), and you will discover some interesting truths when you study the origin of that word.

Step 2-List of words (check topical Bible, Exhaustive Concordance, Dictionary).

1. Adoption
2. Adversary
3. Apostle
4. Atonement
5. Baptize
6. Believe
7. Bless
8. Body
9. Call
10. Chasten
11. Christ
12. Church
13. Confess
14. Covenant
15. Death
16. Disciple
17. Everlasting
18. Evil
19. Faint
20. Faith
21. Favor
22. Fear
23. Fellowship
24. Flesh
25. Good
26. Gospel
27. Grace
28. Hear
29. Hell
30. Holy
31. Hope
32. Immanuel
33. Iniquity
34. Jehovah

35. Jesus
36. Judgment
37. Kingdom
38. Know
39. Law
40. Laying on of
41. Hands
42. Life
43. Light
44. Lord
45. Love
46. Lust
47. Manifest
48. Marriage
49. Mediator
50. Meek
51. Mercy
52. Mind
53. Minister
54. Miracle
55. Mystery
56. Name
57. Obey
58. Passover
59. Peace
60. Perfect
61. Perish
62. Preach
63. Propitiation
64. Reconcile
65. Redeem
66. Remnant
67. Repent
68. Rest
69. Resurrection

- 70. Righteous
- 71. Sabbath
- 72. Sacrifice
- 73. Saint
- 74. Sanctify
- 75. Save
- 76. Servant
- 77. Sin
- 78. Soul
- 79. Spirit
- 80. Temptation
- 81. Trial
- 82. Truth
- 83. Understand
- 84. Vain
- 85. Vision
- 86. Watch
- 87. Wisdom
- 88. Witness
- 89. Word
- 90. World
- 91. Worship

Step 3-Choose Your Word

1. In your previous personal Bible study, you may have wondered what certain words meant. Choose a word that you wondered about or are interested in.

Step 4-Find Its English Definition

1. Use your English dictionary and write out the definition of the English word. List with the definition any synonyms or antonyms of the word.

Step 5-Compare Translations

1. Read in different recent translations the passages where this word is used. Write down the different renderings of the word that you find. Take note of any renderings that are repeatedly and commonly used in these translations.

Step 6-Write Down The Definition of the Original Word

1. Find out what the original word is in your exhaustive concordance or word study book and write down its definition. You may find it has a number of usages.

Step 7-Check The Word's Occurrences in the Bible

1. Using your concordance again, find out how and where the word is used in the Bible. Ask these questions:
 - How many times does the word occur in the Bible?
 - In what books does it occur?
 - What writers used the word?
 - In what book does it occur most?
 - Where does the word occur first in the Bible?
 - Where does it occur first in the book I am studying?

Step 8-Find The Root Meaning and Original of the word

1. This step brings you into some research. You will want to read a fuller discussion of the meaning and origin of the word you are studying, using a Bible dictionary, a Bible encyclopaedia, a word study set, or a theological word book.

Step 9-Discover the Word's Usage in the Bible

1. Here you will want to find out how the word is used in the Bible. The study of the root meaning (Step Six) told you what the word meant originally and where it came from, but some words change their meanings with the passage of time. Also, they might have different meanings in different situations and contexts. In the final analysis, the usage of a word is the most important factor in determining its true meaning. Fulfil this step in the following three ways:
2. Find out how the word was used during the time the book of the Bible was written. How was it used in other writings besides the Bible? To find out what the word meant and how it was used in the culture of the day, you will have to look at extra-biblical materials (for example, histories of the time); many times, however, the word study set you are using will have this information. Advanced students and people who know the original languages may find this information in theological dictionaries and Hebrew and Greek lexicons.
3. Find out how the word is used in the Bible. Using your exhaustive concordance, find out how the word is translated every time it appears in the Bible. Often the Scriptures define words through usage and illustrations; this is a way of finding out the scriptural definition. You may also ask some or all of the following questions:
 - How does the writer use the word in other parts of the book?
 - How does the writer use the word in other books he has written?
 - How is the word used throughout the whole testament?
 - Does the word have more than one usage? If so, what are its other uses?
 - What is the most frequent use of the word?
 - How is it used the first time in the Scriptures?
4. Find out how the word is used in the context of the passage. This is the ultimate test. The context will be your most reliable source for insights into what the writer really meant. Ask these questions:
 - Does the context give any clues to the meaning of the word?
 - Is the word compared or contrasted with another word in the context?
 - Is there any illustration in the context that clarifies the meaning of the word?

Step 10-What Is Immediate Context?**Step 11- What is Whole Context?****Step 12- What Are The Facts Within Context?****Step 13-Summarise your Study**

1. During the first three steps of word study make notes on what you learn about the word. Write down the meanings of the word from the Bible margin, concordance, word study book, and modern dictionary. Record notes on its use in other Bible passages. When you complete your study, use what you have learned about charts and outlines to summarise your word study notes. Remember to record somewhere on your chart or outline the book, chapter, verse number, and word you are studying.

Step 14-What Further Analysis or Research I Need To Do, Next Time?**Step 15-Write out a Personal Application**

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.

17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."
18. Be especially careful to keep your goal of "application, not interpretation only" in mind when you do a word study. Remember that you are doing personal Bible study, not just conducting an academic exercise. Discovering the full meaning of a biblical word is not an end in itself, because a word study without application has little spiritual value. In doing this study, constantly ask yourself, "How can understanding this word strengthen my spiritual life?"

Step 16-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 7-Book Background Method

Step 1-Tools Required for this Method

1. Books
2. Study Bible
3. Exhaustive concordance
4. A Bible dictionary and/or Bible encyclopaedia
5. A Bible handbook
6. A Bible atlas
7. Archaeology and Bible History by Joseph Free and Howard Vos (Zondervan)
8. The Bible and Archaeology by J.A. Thompson (Eerdmans)
9. Everyday Life in Bible Times (National Geographic Society)
10. Great People of the Bible and How They Lived (Reader's Digest Association)
11. Harper's Encyclopaedia of Bible Life by Madeleine S. and J. Lane Miller (Books Sales)
12. The Oxford History of the Biblical World by Michael Coogan (Oxford University Press)
13. The Wycliffe Historical Geography of Bible Lands by Howard Vos (Hendrickson)
14. Church History
15. The Bible Knowledge Background Commentary, edited by Craig Evans, 3 vols. (Victor)
16. Chronological and Background Charts of the New Testament by H. Wayne House (Zondervan)
17. Chronological and Background Charts of the Old Testament by John Walton (Zondervan)
18. The IVP Bible Background Commentary: New Testament by Craig Keener (InterVarsity Press)
19. The IVP Bible Background Commentary: Old Testament by John Walton et al. (InterVarsity Press)
20. Manners and Customs in the Bible by Victor H. Matthews (Hendrickson)
21. The Zondervan Illustrated Bible Background Commentary: New Testament, edited by Clinton Arnold, 4 vols. (Zondervan)

22. The Zondervan Illustrated Bible Background Commentary: Old Testament, edited by John Walton, 4 vols. (Zondervan)

Step 2-Choose The Subject or Book of the Bible

1. Choose the subject, person, word, or book of the Bible you want to study, and begin gathering reference materials for your research. The availability of reference tools will largely determine the scope of your study.

Step 3-List Your Reference Tools

1. List all the reference tools you have gathered to do this study (see Tools You Will Need above). This is to help you remember which books were most useful for the background material you researched and what books you may want to refer to in future background studies.

Step 4-Get Insights from Archeology

1. Read Number of books about archeology of the time, also Biblical Archeology.

Step 5-Obtain Insights from Geography

1. You will need to become familiar with the geography of Palestine and the Near East in general. This includes the types of land found there, the major mountains and hills, elevation and rainfall, the major bodies of water (seas, lakes, rivers), location of cities and countries, famous landmarks, and the borders of surrounding countries of the time you are studying.
2. As you study the New Testament, particularly Paul's missionary travels, you will need to become acquainted with the Mediterranean countries and cities that were active during the days of the Roman Empire.
3. In all of your study of biblical geography, you must continually ask this question: "What is the effect of the surrounding geography on what I am studying?"
4. In this step, list all the insights you can get on geography for the subject or book you are studying.

Step 6-Get insights from History

1. You should have a working knowledge of the chronology (order of historical events) of the nation of Israel in the Old Testament. Learn the periods of history of the Hebrew nation; find out the origin and history of famous cities; learn the divisions of Jesus' ministry; be well versed on the history surrounding Paul's missionary travels. It is also helpful to know what major events were going on in other parts of the world during the time you are studying, in order to have a proper perspective on what God was doing in the world.
2. You might ask yourself, "What caused this particular event that I am studying? How did it affect the people involved? How did it affect the passage I am studying?" Be especially aware of events that illustrate God's sovereign control over the progress of history.
3. In this step, list all the insights you can get on history surrounding the subject or book you are studying.

Step 7-Discover Some Insights from Culture

1. If you are to understand what went on in Bible times, you need to learn about the total lifestyle of the ancient people in the Scriptures. Here are some areas you can research while asking yourself, "How do all these things affect the message and the people about whom I am studying?"
 - Types of clothing people wore.
 - Professions and trades in biblical times.
 - Music in the Bible.
 - Architectural styles in the Near East.
 - Manners and customs in Scripture.
 - Recreation in ancient times.
 - Family life in the Middle East.
 - Art in the Bible.
 - Languages and literature of surrounding nations.
 - Religious ceremonies in Israel and among pagan neighbours.
 - False religions of the area.
 - Weapons and tools used by the people.
2. In this step, list all the insights you derive from the way people lived in their cultures.

Step 8-Research Insights from Political environment

1. Much of what happened in Israel in the Old Testament and in the Roman world of Jesus, Paul, and the apostles is related to the political environment of the times.
2. Kings, emperors, rulers, and other powers governed the people of the time. Israel, for example, spent much of its history under foreign rule and even in exile. These other nations and political systems were bound to have an effect on the way God's people lived. Recognize, however, that God is always in control of the political situation. Even King Nebuchadnezzar acknowledged this fact (Dan. 4:34 – 35).
3. Egypt, Philistia, Assyria, Babylon, Persia, Greece, and Rome all played a major part in the Bible. What were these nations like? How did they affect Israel or the New Testament church? Many of the prophets' messages can only be understood in light of their current political climate.
4. In this step, write down all the insights you can from your research into the political conditions of the time period you are studying.

Step 9-What Is Immediate Context?

Step 10- What is Whole Context?

Step 11- What Are The Facts Within Context?

Step 12-Summarise Your Research

1. Now go back over Step Three through Step Six, and from the data you have gathered, summarise your research by answering these two questions:
 - How does this background information help me understand better what I am studying?
 - What influence did any of these factors have on the subject (or book) that I am studying?

Step 13-What Further Analysis or Research I Need To Do, Next Time?

Step 14-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."
18. Although a personal application may be hard to come by in this type of study, you should be able to get one from your original subject. In fact, research into the background of your subject may enable you to find an application you may need today, and the data can help you make that application personally relevant.

Step 15-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 8-Book Survey Method

Step 1-Tools Required for this Method

1. Books
2. Study Bible
3. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
4. A Bible dictionary and/or Bible encyclopaedia.
5. A Bible handbook. (Look under the name of the book you are studying as well as under the writer and the city or people to whom the original might have been sent.)
6. Bible atlases
7. Historical
8. Geographies
9. Historical background books
10. Bible surveys
11. Later you may check yourself and your conclusions against what other reliable scholars have done
12. The Illustrated Guide to Biblical History by Kendall Easley (Broadman & Holman)
13. Nelson's New Testament Survey by Mark Bailey and Tom Constable (Nelson)
14. Nelson's Old Testament Survey by Charles Dyer and Eugene Merrill (Nelson)
15. New Testament Survey by Merrill C. Tenney (Eerdmans)
16. New Testament Times by Merrill C. Tenney (Baker)
17. The Old Testament Speaks by Samuel J. Schultz (HarperSanFrancisco)
18. Old Testament Times by R.K. Harrison (Baker)
19. Old Testament Today by John Walton and Andrew Hill (Zondervan)
20. Survey of the Bible by William Hendriksen (Baker)
21. A Survey of the New Testament by Robert H. Gundry (Zondervan)
22. What the Bible Is All About: NIV Edition by Henrietta C. Mears (Regal)
23. Survey — get a bird's-eye view of the book.
24. Analysis — study everything in each chapter in detail.
25. Synthesis — put it back together again and draw some conclusions.

Step 2-Read the Book

1. This first step may seem obvious, but some people spend all their time reading about the Bible rather than reading the Scripture text itself. The only tools needed for this first step are your study Bible and several recent translations. Do not read any Bible surveys, handbooks, or commentaries at this point. Follow these seven suggestions:
2. Read through the book at one sitting. Except for the Psalms, the longest book in the Bible is Isaiah, and it can be read in three or four hours. Most of the other books, particularly those in the New Testament, can be read in much less time. If you have to break up your reading, try to finish a book in no more than two sittings. (For example, read Isaiah 1 – 39 at one sitting, then Isaiah 40 – 66.) You will be amazed at what you begin to see in Scripture as you do this.
3. Read through the book in a recent translation. This will enable you to understand what you are reading better, because you will be doing your reading in contemporary language.
4. Read through the book rapidly, ignoring the chapter divisions. Remember that the chapter divisions and verses were not in the original writing; they were added much later for convenience. Right now your purpose is to get the flow of the book and feel the pulse of the writer. Don't be concerned with the details at this stage (you will do that in the Chapter Analysis Method, chapter 10), but read the book quickly to get its main thrust.
5. Read through the book repeatedly. Repeat the process of reading as many times as you can. (Obviously, you will not be able to read the book of Isaiah as many times as the book of Colossians in a given time frame.) Each time you read the book through, you will notice some new things and the overall picture will become clearer and clearer. The more times you read a book through, the better you will be able to understand it. So stay with it.
6. Read through the book without referring to commentaries or someone else's notes. It is good to read in a Bible in which you have not made any notes yourself. Otherwise, when you see the notes you may have written (your own or others'), your mind will naturally fall back into that pattern and you will be hindered from seeing new things. After you have finished Step One, you may begin consulting with reference helps.
7. Read through the book prayerfully. Ask God to speak to your heart and open your eyes that you may see wonderful things in his law (Ps. 119:18).

8. Read through the book with pen or pencil in hand. As you begin reading the second or third time through, begin taking notes and making observations on what you are reading (see Step Two and the Book Survey Form).

Step 3-Make notes on what you Read

1. As you read through the book (see Step One), write down your impressions and the important facts you discover. Make these notes on a separate piece of paper or on the Book Survey Form found at the end of this chapter. Look for the following nine items:
2. Category: Is the book history? Poetry? Prophecy? Law? A biography? A letter?
3. First Impressions: What is the first impression you get from the book? What do you think is the purpose of the writer? What “feel” do you get from reading it?
4. Key Words: What are some of the significant words the writer uses? What words are repeated the most? What word or words is he emphasizing?
5. Key Verse: What seems to be the key verse (if any)? What ideas or phrases are repeated that may show his main thought? What is the writer’s key statement?
6. Literary Style: Is the book a narrative? A drama? A personal letter? A discourse? Poetry? A combination of narration and poetry? Does the writer use figurative speech? Is he using a logical argument?
7. Emotional Tone: Is the writer angry? Sad? Happy? Worried? Excited? Depressed? Calm? How do you think his hearers must have felt when they received this writing? How does it make you feel?
8. Main Theme(s): What is the main theme? Is there more than one? What is the writer saying? What is his major emphasis?
9. Structure of the Book: Are there obvious divisions of thought in the book? How is the book organized? Around people? Events? Places? Ideas? Time spans?
10. Major People: Who are the principal personalities in the book? Which people are mentioned the most, and what parts do they play in the book?

Step 4-Initial Survey

1. Read the entire book at one sitting to identify the theme (subject) of the book. Choose a title that summarizes the theme. You will use this title on the Book Study Chart. This will also become the title of your outline.
2. Determine the purpose for which the book was written, to whom it was written, and the author.
3. Some books state the name of the author but for the names of others you will need to consult an outside Bible study resource.* Each author had a special reason for writing under the inspiration of the Holy Spirit. This purpose is usually reflected in the content of the book.
4. Determine the geographic setting of the book. This is where the events occurred. Record this on the Book Study Chart.
5. Summarize the basic life and ministry principle in one sentence. This is the basic truth of the book which is applicable to your life or ministry. There are many principles taught in a single book, but try to determine the most important for this summary statement. Remember, the chapter divisions in the Bible are not divinely inspired. They were made by man for ease in locating specific passages in the Bible. When you read the entire book without chapter divisions you are reviewing the message as it was originally given.
6. In this first reading do not be concerned with details. Survey the book for general information: Theme, author, purpose, to whom, geographic setting, and basic life and ministry principle. Read quickly to gain an overview of the entire book. Do not stop and analyze what you are reading. You will do that later.

Step 5-Book Study Chart

1. Read the book a second time. Note the major divisions of the book. These divisions may be determined by subject matter, events, biographical material, geographical settings, or other such factors.
2. Create titles for each chapter of the book. The chapter title should reflect the general content of a chapter but it should not be so general that it could fit any chapter of the Bible. Think of titles as handles with which to grasp the content of the chapter. Keep them short so they are easy to remember. Enter these chapter titles on the Book Study Chart.
3. Select the key verse of the book. The key verse should be one that best summarizes the purpose or content of the book. Enter the reference on the Book Study Chart. As you read, list the names of major characters in the space provided on the chart. This list will provide a selection from which to do biographical studies. You will learn how to do such studies later in this course.
4. Record key words and phrases on the chart. Key words and phrases are those basic to understanding the book. They are often repeated frequently or explained in detail in the book. You can use this list for word studies which you will learn how to do later in this course.

Step 6-Do Background Study

1. Find out the historical and geographical setting of the book. Into what background does the book fit? You can use the following questions to help you find some of the facts. Also use the ideas presented in the Book Background Method of Bible
2. Study (chapter 8). Many of the answers may be found right in the book itself, so look there first. If you can't find the answers in the text alone, then check outside references (see Tools You Will Need earlier in this chapter).
 - What can I learn about the writer(s)?
 - When was the book written? (Date)
 - Where was the book written?
 - To whom was the book written? Who were they? Who was he? Who was she? (Find out about their historical and geographical backgrounds.)
 - Why was the book written? (Investigate the circumstances related to the writing.)
 - What other background information sheds light on this book?

- What is the place of this book in the Bible? Is it a bridge between various periods of history?
- What are the geographic locations mentioned in the book? Where are they? (Draw a map if it will be helpful to you.)

Step 7-Make Horizontal chart of the Book's Content

1. One of the exciting steps in doing a book survey is making a horizontal chart. This is a diagramed layout of a book's contents on one or two sheets of paper. The value of such a chart is that it enables you to lay out visually the book's contents and divisions. It gives you a new perspective of the book. The three parts to a simple horizontal chart are the major divisions of the book, chapter titles, and paragraph titles. Why make a horizontal chart? You gain several benefits in this study by making one.
 - It helps you summarise the main ideas and contents of a book.
 - It enables you to see the contents of an entire book at a glance.
 - It helps you discover the relationships between chapters and between paragraphs.
 - It makes you aware of ideas repeated in several places in the book.
 - It serves as a memory device to help you recall a chapter's content quickly.
 - It enables you to think through a book and remember it. Preparation for making a horizontal chart. You need three tools to make a simple horizontal chart:
 - A Bible with paragraph divisions. Many recent versions have divided the text into paragraphs to enable you to see the units of thought. You have to know these in order to make the chart.
 - A pencil (or pen) and a ruler.
 - A blank sheet of paper, preferably 8 x 11 in size. Try to fit your chart on one sheet of paper so you can see the entire structure of the book at a glance. When you are working on a long book (e.g., Isaiah, Genesis, Psalms), try to use as few sheets as possible. In using more than one sheet, be sure to use the same scale so you can match the sheets. How to make a horizontal chart. Go through the following four steps for each chart you make.
2. On a blank sheet of paper, make as many vertical columns as there are chapters in the book. For longer books, make the columns narrower and abbreviate what you write in them and use two or three sheets of paper as needed.
3. Read through the book again and find its major divisions. Record these divisions in as few words as possible at the top of your chart (see the Sample Filled-out Form).

4. Read through the book again and think of a title for each chapter (or group of chapters in a longer book). Record these at the top of each column directly below the major divisions. Irving Jensen has suggested five characteristics of good chapter titles (Independent Bible Study, Moody Press, p. 108).
 - Preferably use one word, not more than four.
 - Use picturesque words that help you visualise the contents.
 - Use words taken directly from the text if possible.
 - Use words that have not been used previously as chapter titles in your study of other books.
 - Use words that tell you where you are in the book.
5. Read through the book once more and do the same thing to all the paragraphs in your book. Try to relate the paragraph titles to the chapter title under which they fall. As you become proficient in this exercise, you may add things to your charts that personalise your study.

Step 8-What Is Immediate Context?

Step 9- What is Whole Context?

Step 10-What Are The Facts Within Context?

Step 11-Make Tentative Outline of Book

1. After you have summarised the contents of the book on a horizontal chart, you are ready to make a simple tentative outline of the book. Later on, in the Book Synthesis Method of Bible Study (chap. 11), you will make your final, detailed outline of the book. In the current method you should merely outline the high points of the book and show their relationship with one another. Here are some suggestions:
2. Refer to your horizontal chart for ideas in outlining. Often your chart will readily show the natural organisation of the book's contents.
3. Outline from the major to the minor. Look for major divisions of the book first, then the subdivisions (which could be the chapters themselves), and finally the important points that fall under the subdivisions (which could be the paragraphs). In longer books you may need to have further subpoints under these.
4. Watch your paragraph divisions for clues in outlining. Since the paragraphs the basic unit of thought in writing, you can use the paragraph divisions as a guide in designing the outline of the chapter. Write a summary statement for each paragraph, then use those statements as the major points of your outline.
 - I. After you have done your own outlining, compare yours with as many other outlines as you can. Check the reference books available to you and compare your work with those writers. Don't be concerned if your outline does not match these exactly, for often there are many ways to outline a book. You will discover that even notable scholars disagree with each other.

Step 12-What Further Analysis or Research I Need To Do, Next Time?

Step 13-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."
18. Even though the main purpose of a book survey is to get you acquainted with its general contents, you should not forget to make a personal application of some insight you discover along the way. Select one thing the Lord spoke to you about from your survey and write a personal, practical, possible, and measurable application on that truth. (See the instructions in chapter 1 on how to write a meaningful application.)

Step 14-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 9 - Chapter Analysis Method

Step 1-Tools Required for this Method.

1. Books
2. Study Bible
3. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
4. A Bible dictionary and/or Bible encyclopaedia.
5. A Bible handbook. (Look under the name of the book you are studying as well as under the writer and the city or people to whom the original might have been sent.)
6. Bible atlases
7. Historical
8. Geographies
9. Historical background books
10. Bible surveys
11. Later you may check yourself and your conclusions against what other reliable scholars have done
12. The Illustrated Guide to Biblical History by Kendall Easley (Broadman & Holman)
13. Nelson's New Testament Survey by Mark Bailey and Tom Constable (Nelson)
14. Nelson's Old Testament Survey by Charles Dyer and Eugene Merrill (Nelson)
15. New Testament Survey by Merrill C. Tenney (Eerdmans)
16. New Testament Times by Merrill C. Tenney (Baker)
17. The Old Testament Speaks by Samuel J. Schultz (HarperSanFrancisco)
18. Old Testament Times by R.K. Harrison (Baker)
19. Old Testament Today by John Walton and Andrew Hill (Zondervan)
20. Survey of the Bible by William Hendriksen (Baker)
21. A Survey of the New Testament by Robert H. Gundry (Zondervan)
22. What the Bible Is All About: NIV Edition by Henrietta C. Mears (Regal)
23. Survey — get a bird's-eye view of the book.
24. Analysis — study everything in each chapter in detail.
25. Synthesis — put it back together again and draw some conclusions.
26. Methodical Bible Study by Robert A. Traina (Zondervan) [Very advanced]

27. The Navigator Bible Studies Handbook (NavPress)
28. The New Joy of Discovery in Bible Study by Oletta Wald (Augsburg Fortress)
29. Personal Bible Study by William Lincoln (Bethany Fellowship)
30. Basic Biblical Interpretation by Roy Zuck (Victor)
31. Basics of Bible Interpretation by Bob Smith (Word Books)
32. Getting the Message by Daniel Doriani (Presbyterian & Reformed)
33. Grasping God's Word by Scott Duvall and Daniel Hays (Zondervan)
34. How to Read the Bible for All Its Worth by Gordon Fee and Douglas Stuart (Zondervan)
35. How to Understand Your Bible by T. Norton Sterrett (InterVarsity Press)
36. Protestant Biblical Interpretation by Bernard Ramm (Baker)
37. Studying, Interpreting, and Applying the Bible by Walter Henrichsen and Gayle Jackson (Zondervan)

Step 2-Select Chapter Title

1. Record on the Chapter Study Chart the name of the book and chapter number you are studying. Read the entire chapter and give it a title which reflects its content. (If you have done a book survey, you will have already selected a chapter title. Chapter Eleven on book study explains how to select chapter titles).

Step 3-Mark Paragraph Divisions

1. Mark the paragraph divisions within the chapter. In some Bibles the paragraphs are marked with a special paragraph mark (¶). In other Bibles they are marked with a boldface verse number. (Boldface means that the number is darker than the numbers in front of other verses.) If your Bible has neither paragraph marks or boldface markings then you must determine the paragraph divisions yourself. To do this you must know the definition of a paragraph: "A paragraph is a group of verses which relate to the same subject matter. When the subject changes, then a new paragraph has begun."
2. Mark the paragraph divisions in your Bible by drawing a circle around the verse number where each paragraph begins.

Step 4-Create Chapter Study Chart

1. On the Chapter Study Chart record the title of the chapter. List the verses of the paragraph divisions (see example). Then give each paragraph a title which reflects the content of that paragraph. Use the column with the heading "Notes" to record your thoughts about the relation between parts of the chapter (see example). These notes will assist you in creating the chapter outline.

Step 5-Write out Chapter Summary

1. You begin this step by reading and rereading the chapter many times. All you are doing here is making general observations on the chapter as a whole. After you have read it through several times, describe the general contents in one of the ways about to be described. Do not try to interpret what you see at this time, but merely aim to become familiar with the chapter. You may summarize it in one of the following ways:
2. Paraphrase it. The simplest way is just to rephrase the chapter in your own words. Summarize it in such a way that you could read your paraphrase to another person. You can check some recent paraphrase versions of the Bible for examples of this.
3. Outline it. Another simple way to summarize is through an outline that follows the paragraph divisions of the chapter. Give a title to each paragraph, then place some subpoints under each one.
4. Rewrite it without the modifying clauses and phrases. Use just the subjects, verbs, and objects in your summary. This is a great way to summarize some of Paul's writings, for example, where run-on sentences (especially in the King James Version) are hard to understand because of their complexity. After you have completed your chapter summary, give a title to the chapter, using either your title from the book survey or a new one that occurred to you during this study.

Step 6-List Your Observations

1. This step begins the verse-by-verse analysis of the chapter. You start with the activity of observation. In this step you are looking in detail at every sentence and word and then writing down everything you see. You are trying to answer the question, “What does it say?” Before you can begin to interpret the meaning of a verse or passage, you must first look at what it actually says. The purpose of observation is to saturate yourself completely with the contents of a Bible passage. The mark of good Bible students is that they have trained themselves to observe things in the text that others overlook.
2. Overlooking biblical facts — reasons why. There are three reasons why we often overlook things and miss so much in the biblical text: (1) We rush through a passage too quickly. So we need to slow down and not indulge in speed-reading.
3. (2) We don’t write down our observations. Louis Agassiz, a 19th-century professor of zoology at Harvard who taught his students the art of observation, used to say, “A pencil is the best eye.” We need to write down what we see, and then we will begin seeing more. (3) We give up too soon. The longer we squeeze a lemon, the more juice we get out of it — to a point. But unlike lemons, the Bible never goes dry. We can study a text a hundred times and never exhaust the riches that are in it. So we shouldn’t give up too soon; rather, we should keep on looking — the longer the better.
4. Asking questions. As has already been discussed, the secret of good Bible study is learning to ask the right questions (see the Introduction at the beginning of this book). The number of questions you can ask of a text of Scripture increases in proportion to your willingness to stick with it. As you continue growing in Bible study skills, the type and number of questions you ask will improve and you will be able to observe more and more. The key to good observations, then, is a combination of diligence, patience, asking many questions, and writing down everything you see.
5. To help you in your observations, appendix F lists 30 ideas from which you can select the ones that will suit your study.

Step 7-What Is Immediate Context?

Step 8- What is Whole Context?

Step 9-What Are The Facts Within Context?

Step 10-Ask Interpretation Questions

1. After observing all you can in the passage under study, you are ready to move on to interpretation. This step involves asking questions about meaning, then trying to find answers to them. In this exercise you discover the biblical writer's purpose and message by uncovering what he means by his idea. Interpretive questions include asking what or why. Some examples:
 - Why did the writer say this?
 - What is the meaning of?
 - What is the significance of?
 - What is the implication of?
 - Why is this important?
2. You should be able to think of many other interpretive questions to ask. Never think that any question is too silly or dumb. Always write every question down on your form even though you may not find an answer to it. Later on, in studying another chapter, you may be able to answer it; if so, come back to this chapter's form and fill in the answer. Remember that the more questions you ask, the more you will draw out of the text.
3. Listing difficulties. When you are writing down your questions, it is a good idea to include any difficulties you have in understanding what is being said. Two common types are personal difficulties — questions you would like answered in the future, or items for future study, and possible difficulties — matters that don't bother you at this time, but would be good to study so you can help others who might be bothered by them.
4. Finding the right meaning of the text. After you have listed all your questions of interpretation, you need to start finding some answers. There are several ways to do this.
5. Check the context. You should always start here, for often the answers to your questions will be found in the verses preceding or following the text. Always interpret a passage in light of its context. To review the context, you may have to go back to your observations or your book survey to answer these questions:
 - Who is speaking?
 - Who is being spoken to?
 - When is it being spoken?
 - Where is it being spoken?

- What is the occasion or circumstance?
 - What is the main subject of the message?
 - Is the aim of what is being said revealed?
 - What other background material clarifies this statement?
6. You can avoid a great deal of misinterpretation by first checking out the context of a verse.
 7. Define the words and phrases used. You must interpret your text according to the correct and proper meaning of the words. Look up the important words in a Bible dictionary, word study set, or English dictionary.
 8. Study the grammar and structure of the sentences. Sometimes a problem of interpretation can be cleared up by diagramming a sentence or by understanding what grammatical usage the writer intended in the paragraph. Compare several translations of the text. Use different recent versions of the Bible to see how the various translators rendered a particular word, phrase, or paragraph.
 9. Study the background of the text. Interpret your text in light of the historical, cultural, geographic, economic, social, and political backgrounds of the book, including the current events of that time. This shows you the value of doing a book survey study before attempting a chapter analysis study. Use your reference tools to check on the background, the writer's purpose in writing the book, and other pertinent factors.
 10. Compare your text with other passages of Scripture. This next step — correlation— will give you some answers to interpretive questions as you compare Scripture with Scripture.
 11. Consult a commentary as a last resort. If you have tried diligently to find the meaning of the text yourself and your cross-references have not helped you, consult the works of great Bible scholars. There is a place for commentaries in Bible study, but it comes only after you have done your own work. Compare your interpretation with the writings of devout Christians and see if yours agrees with theirs. If you have a correct interpretation, you may be sure God has shown it to some other sincere Bible students in the past. If you can't find anyone who agrees with you, you have probably got a wrong interpretation.
 12. Ask the six vital observation questions: What? Why? When? How? Where? Who?
 13. Look for key words.

14. Look for repeated words and phrases.
15. Look for questions being asked.
16. Look for answers being given.
17. Look for commands.
18. Look for warnings.
19. Look for comparisons — things that are alike.
20. Look for contrasts — things that are different.
21. Look for illustrations.
22. Look for causes and effects and reasons for doing things.
23. Look for promises and their conditions for fulfilment.
24. Look for progression from the general to the specific.
25. Look for progression from the specific to the general.
26. Look for steps of progression in a narrative or biography.
27. Look for lists of things.
28. Look for results.
29. Look for advice, admonitions, and attitudes.
30. Look for the tone of the passage — emotional atmosphere.
31. Look for connectives, articles, and prepositions.
32. Look for explanations.
33. Look for Old Testament quotes in the New Testament.
34. Look for the literary form.
35. Look for paradoxes.
36. Look for emphasis through the use of space — proportion.
37. Look for planned exaggerations or hyperboles.
38. Look at the grammatical construction of each sentence.
39. Look for the use of the current events of the times.
40. Look for the force of the verbs.
41. Look for anything unusual or unexpected.

Step 11-Correlate Your Chapter with Other Scriptures

1. This step involves finding cross-references for the verses of your chapter in order to further explain the meaning of the text. It is based on the principle of interpretation that says, "The Bible interprets itself; Scripture best explains Scripture." You can often interpret passages that are not clear by passages that are. Ask yourself, "How do other Scriptures relate to and explain this one?"
Steps in cross-referencing. Here are some practical ways to correlate verses:
2. First, look for cross-references within the same book you are studying. This is internal correlation.
3. Second, compare statements in other writings by the same author. This is external correlation.
4. Then, compare with other books in the same testament.
5. Finally, compare references in all of Scripture. You can find cross-references in a study Bible or reference Bible or by looking up similar words in a concordance. Types of cross-references. There are several different types of cross-references, including the following:
 - The pure cross-reference. This is sometimes called the parallel cross reference because it says almost exactly the same thing as the verse you are analyzing.
 - The illustrative cross-reference. This type, which may involve a real event or person in history, illustrates what the verse you are studying is saying.
 - The contrasting cross-reference. This type says the opposite of what your verse says. It may look like a contradiction, but it is actually approaching the subject from a different viewpoint. One word of caution: Be sure to check the context of the verses you choose as cross-references. Otherwise you may be making them say what the writer did not say.

Step 12-List Some Possible Applications

1. The last part of the verse-by-verse analysis is to write down some possible applications. Remember that your goal in Bible study is not just interpretation but application. Because of the many applications a chapter may have, you will only be listing them here. Later on, in Step Seven, you will choose one of these to write out and to work on for a week. You have already seen that you cannot work on more than one application per week. It is better to record just one and fully apply that truth to your life than to write down several applications and then fail to implement any of them.

Step 13-Write Down Some Concluding Thoughts

1. Go back over the results of the first five steps, review them carefully, and write down some concluding thoughts on the chapter. These can include additional observations, some of your interpretations, themes you have discovered, possible topics and people you want to study in the future, words you may want to do a word study on, and any number of other thoughts that come to mind.

Step 14-What Further Analysis or Research I Need To Do, Next Time?

Step 15-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned
2. Who?
3. What?
4. When?
5. Where?
6. Why?
7. How?
8. Example to Follow.
9. Error to Avoid.
10. Duty to Perform.
11. Promise to claim.
12. Relationship to develop.
13. Changes to make.
14. Prayer to pray.

15. Did I see anything of myself in this person's life?
16. Did he show some of my weaknesses?
17. Did he reveal to me some of my strengths?
18. What impressed me most about this person's life?
19. Where do I fall short in this area?
20. What do I intend to do about it?
21. What were the positive character traits? Ask God to help you develop them in your own life.
22. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
23. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 16-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 10-Paragraph Study

Step 1-Tools Required for this Method

1. Book
2. Study Bible
3. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
4. A Bible dictionary and/or Bible encyclopaedia.
5. A Bible handbook. (Look under the name of the book you are studying as well as under the writer and the city or people to whom the original might have been sent.)
6. Bible atlases
7. Historical
8. Geographies
9. Historical background books
10. Bible surveys
11. Later you may check yourself and your conclusions against what other reliable scholars have done
12. The Illustrated Guide to Biblical History by Kendall Easley (Broadman & Holman)
13. Nelson's New Testament Survey by Mark Bailey and Tom Constable (Nelson)
14. Nelson's Old Testament Survey by Charles Dyer and Eugene Merrill (Nelson)
15. New Testament Survey by Merrill C. Tenney (Eerdmans)
16. New Testament Times by Merrill C. Tenney (Baker)
17. The Old Testament Speaks by Samuel J. Schultz (HarperSanFrancisco)
18. Old Testament Times by R.K. Harrison (Baker)
19. Old Testament Today by John Walton and Andrew Hill (Zondervan)
20. Survey of the Bible by William Hendriksen (Baker)
21. A Survey of the New Testament by Robert H. Gundry (Zondervan)
22. What the Bible Is All About: NIV Edition by Henrietta C. Mears (Regal)
23. Survey — get a bird's-eye view of the book.
24. Analysis — study everything in each chapter in detail.
25. Synthesis — put it back together again and draw some conclusions.
26. Methodical Bible Study by Robert A. Traina (Zondervan) [Very advanced]

27. The Navigator Bible Studies Handbook (NavPress)
28. The New Joy of Discovery in Bible Study by Oletta Wald (Augsburg Fortress)
29. Personal Bible Study by William Lincoln (Bethany Fellowship)
30. Basic Biblical Interpretation by Roy Zuck (Victor)
31. Basics of Bible Interpretation by Bob Smith (Word Books)
32. Getting the Message by Daniel Doriani (Presbyterian & Reformed)
33. Grasping God's Word by Scott Duvall and Daniel Hays (Zondervan)
34. How to Read the Bible for All Its Worth by Gordon Fee and Douglas Stuart (Zondervan)
35. How to Understand Your Bible by T. Norton Sterrett (InterVarsity Press)
36. Protestant Biblical Interpretation by Bernard Ramm (Baker)
37. Studying, Interpreting, and Applying the Bible by Walter Henrichsen and Gayle Jackson (Zondervan)

Step 2-Select Chapter Title

1. Record on the Chapter Study Chart the name of the book and chapter number you are studying. Read the entire chapter and give it a title which reflects its content. (If you have done a book survey, you will have already selected a chapter title. Chapter Eleven on book study explains how to select chapter titles).

Step 3-Mark Paragraph Divisions

1. Mark the paragraph divisions within the chapter. In some Bibles the paragraphs are marked with a special paragraph mark (¶). In other Bibles they are marked with a boldface verse number. (Boldface means that the number is darker than the numbers in front of other verses.) If your Bible has neither paragraph marks or boldface markings then you must determine the paragraph divisions yourself. To do this you must know the definition of a paragraph: "A paragraph is a group of verses which relate to the same subject matter. When the subject changes, then a new paragraph has begun."
2. Mark the paragraph divisions in your Bible by drawing a circle around the verse number where each paragraph begins.

Step 4-Create Chapter Study Chart

1. On the Chapter Study Chart record the title of the chapter. List the verses of the paragraph divisions (see example). Then give each paragraph a title which reflects the content of that paragraph. Use the column with the heading "Notes" to record your thoughts about the relation between parts of the chapter (see example). These notes will assist you in creating the chapter outline.

Step 5-Write out Chapter Summary

1. You begin this step by reading and rereading the chapter many times. All you are doing here is making general observations on the chapter as a whole. After you have read it through several times, describe the general contents in one of the ways about to be described. Do not try to interpret what you see at this time, but merely aim to become familiar with the chapter. You may summarise it in one of the following ways:
2. Paraphrase it. The simplest way is just to rephrase the chapter in your own words. Summarise it in such a way that you could read your paraphrase to another person. You can check some recent paraphrase versions of the Bible for examples of this.
3. Outline it. Another simple way to summarise is through an outline that follows the paragraph divisions of the chapter. Give a title to each paragraph, then place some sub-points under each one.
4. Rewrite it without the modifying clauses and phrases. Use just the subjects, verbs, and objects in your summary. This is a great way to summarise some of Paul's writings, for example, where run-on sentences (especially in the King James Version) are hard to understand because of their complexity. After you have completed your chapter summary, give a title to the chapter, using either your title from the book survey or a new one that occurred to you during this study.

Step 6-List Your Observations

1. This step begins the verse-by-verse analysis of the chapter. You start with the activity of observation. In this step you are looking in detail at every sentence and word and then writing down everything you see. You are trying to answer the question, “What does it say?” Before you can begin to interpret the meaning of a verse or passage, you must first look at what it actually says. The purpose of observation is to saturate yourself completely with the contents of a Bible passage. The mark of good Bible students is that they have trained themselves to observe things in the text that others overlook.
2. Overlooking biblical facts — reasons why. There are three reasons why we often overlook things and miss so much in the biblical text: (1) We rush through a passage too quickly. So we need to slow down and not indulge in speed-reading.(2) We don’t write down our observations. Louis Agassiz, a 19th-century professor of zoology at Harvard who taught his students the art of observation, used to say, “A pencil is the best eye.” We need to write down what we see, and then we will begin seeing more. (3) We give up too soon. The longer we squeeze a lemon, the more juice we get out of it — to a point. But unlike lemons, the Bible never goes dry. We can study a text a hundred times and never exhaust the riches that are in it. So we shouldn’t give up too soon; rather, we should keep on looking — the longer the better.
3. Asking questions. As has already been discussed, the secret of good Bible study is learning to ask the right questions (see the Introduction at the beginning of this book). The number of questions you can ask of a text of Scripture increases in proportion to your willingness to stick with it. As you continue growing in Bible study skills, the type and number of questions you ask will improve and you will be able to observe more and more. The key to good observations, then, is a combination of diligence, patience, asking many questions, and writing down everything you see.
4. To help you in your observations, appendix lists 30 ideas from which you can select the ones that will suit your study.

Step 7-What Is Immediate Context?

Step 8-What is Whole Context?

Step 9-What Are The Facts Within Context?

Step 10-Ask Interpretation Questions

1. After observing all you can in the passage under study, you are ready to move on to interpretation. This step involves asking questions about meaning, then trying to find answers to them. In this exercise you discover the biblical writer's purpose and message by uncovering what he means by his idea. Interpretive questions include asking what or why. Some examples:
 - Why did the writer say this?
 - What is the meaning of?
 - What is the significance of?
 - What is the implication of?
 - Why is this important?
2. You should be able to think of many other interpretive questions to ask. Never think that any question is too silly or dumb. Always write every question down on your form even though you may not find an answer to it. Later on, in studying another chapter, you may be able to answer it; if so, come back to this chapter's form and fill in the answer. Remember that the more questions you ask, the more you will draw out of the text.
3. Listing difficulties. When you are writing down your questions, it is a good idea to include any difficulties you have in understanding what is being said. Two common types are personal difficulties — questions you would like answered in the future, or items for future study, and possible difficulties — matters that don't bother you at this time, but would be good to study so you can help others who might be bothered by them.
4. Finding the right meaning of the text. After you have listed all your questions of interpretation, you need to start finding some answers. There are several ways to do this.
5. Check the context. You should always start here, for often the answers to your questions will be found in the verses preceding or following the text. Always interpret a passage in light of its context. To review the context, you may have to go back to your observations or your book survey to answer these questions:
 - Who is speaking?
 - Who is being spoken to?
 - When is it being spoken?
 - Where is it being spoken?

- What is the occasion or circumstance?
 - What is the main subject of the message?
 - Is the aim of what is being said revealed?
 - What other background material clarifies this statement?
6. You can avoid a great deal of misinterpretation by first checking out the context of a verse.
 7. Define the words and phrases used. You must interpret your text according to the correct and proper meaning of the words. Look up the important words in a Bible dictionary, word study set, or English dictionary.
 8. Study the grammar and structure of the sentences. Sometimes a problem of interpretation can be cleared up by diagramming a sentence or by understanding what grammatical usage the writer intended in the paragraph. Compare several translations of the text. Use different recent versions of the Bible to see how the various translators rendered a particular word, phrase, or paragraph.
 9. Study the background of the text. Interpret your text in light of the historical, cultural, geographic, economic, social, and political backgrounds of the book, including the current events of that time. This shows you the value of doing a book survey study before attempting a chapter analysis study. Use your reference tools to check on the background, the writer's purpose in writing the book, and other pertinent factors.
 10. Compare your text with other passages of Scripture. This next step — correlation— will give you some answers to interpretive questions as you compare Scripture with Scripture.
 11. Consult a commentary as a last resort. If you have tried diligently to find the meaning of the text yourself and your cross-references have not helped you, consult the works of great Bible scholars. There is a place for commentaries in Bible study, but it comes only after you have done your own work. Compare your interpretation with the writings of devout Christians and see if yours agrees with theirs. If you have a correct interpretation, you may be sure God has shown it to some other sincere Bible students in the past. If you can't find anyone who agrees with you, you have probably got a wrong interpretation.
 12. Ask the six vital observation questions: What? Why? When? How? Where? Who?
 13. Look for key words.

14. Look for repeated words and phrases.
15. Look for questions being asked.
16. Look for answers being given.
17. Look for commands.
18. Look for warnings.
19. Look for comparisons — things that are alike.
20. Look for contrasts — things that are different.
21. Look for illustrations.
22. Look for causes and effects and reasons for doing things.
23. Look for promises and their conditions for fulfilment.
24. Look for progression from the general to the specific.
25. Look for progression from the specific to the general.
26. Look for steps of progression in a narrative or biography.
27. Look for lists of things.
28. Look for results.
29. Look for advice, admonitions, and attitudes.
30. Look for the tone of the passage — emotional atmosphere.
31. Look for connectives, articles, and prepositions.
32. Look for explanations.
33. Look for Old Testament quotes in the New Testament.
34. Look for the literary form.
35. Look for paradoxes.
36. Look for emphasis through the use of space — proportion.
37. Look for planned exaggerations or hyperboles.
38. Look at the grammatical construction of each sentence.
39. Look for the use of the current events of the times.
40. Look for the force of the verbs.
41. Look for anything unusual or unexpected.

Step 11-Correlate Your Chapter with Other Scriptures

1. This step involves finding cross-references for the verses of your chapter in order to further explain the meaning of the text. It is based on the principle of interpretation that says, "The Bible interprets itself; Scripture best explains Scripture." You can often interpret passages that are not clear by passages that are. Ask yourself, "How do other Scriptures relate to and explain this one?" Steps in cross-referencing. Here are some practical ways to correlate verses:
2. First, look for cross-references within the same book you are studying. This is internal correlation.
3. Second, compare statements in other writings by the same author. This is external correlation.
4. Then, compare with other books in the same testament.
5. Finally, compare references in all of Scripture. You can find cross-references in a study Bible or reference Bible or by looking up similar words in a concordance. Types of cross-references. There are several different types of cross-references, including the following:
 - The pure cross-reference. This is sometimes called the parallel cross reference because it says almost exactly the same thing as the verse you are analysing.
 - The illustrative cross-reference. This type, which may involve a real event or person in history, illustrates what the verse you are studying is saying.
 - The contrasting cross-reference. This type says the opposite of what your verse says. It may look like a contradiction, but it is actually approaching the subject from a different viewpoint. One word of caution: Be sure to check the context of the verses you choose as cross-references. Otherwise you may be making them say what the writer did not say.

Step 12-Observe the Details

1. The paragraphs in a chapter can relate to each other in different ways. Here are some special things to observe as you study paragraphs:
2. Connectives: Words called "connectives" are very important. They reveal relationships within and between paragraphs. The word "but" is a connective and introduces a contrast. For example: But these speak evil of those things which they know not; But what they know naturally, as brute beasts, in those things they corrupt themselves. (Jude 1:10).
3. There is a contrast in this paragraph. False teachers speak evil of things they do not know BUT they also corrupt the things they do know. The verse begins with the word "but" which should make you look back to verse 9 to see what the contrast is: Yet Michael the archangel, when contending with the devil he disputed about the body of Moses, durst not bring against him a railing accusation, but said, The Lord rebuke thee. (Jude 1:9) Verse 10 contrasts false teachers who speak evil of dignities with the archangel Michael. Even though he held a great position, he did not accuse the devil but said "The Lord rebuke thee." The connective word "or" indicates a contrast. For example: For God shall bring every work into judgment, with every secret thing, whether it be good OR whether it be evil. (Ecclesiastes 12:14) Other connective words to watch for are "like" and "as." Instead of a contrast these words show comparisons between things. For example in the following verse Satan is compared to a lion: . . . the Devil AS a roaring lion, walketh about, seeking whom he may devour. (I Peter 5:8) The word "and" is another connective. It adds to what has just been stated: Like wise also these filthy dreamers defile the flesh, despise dominion, AND speak evil of dignities. (Jude 1:8) The word "if" introduces a conditional statement. Many of the promises and prophecies of the Old Testament are stated this way. They tell what God will do IF (on the condition that) His people make a certain response: IF my people, which are called by my name, shall humble themselves, and pray, and seek my face, and turn from their wicked ways, then will I hear from Heaven and will forgive their sin, and will heal their land. (II Chronicles 7:14) The word "that" sets forth a purpose. It tells that something happened "in order that" a certain purpose would be accomplished: And He came and dwelleth in a city called Nazareth; THAT it might be fulfilled which was spoken by the prophets, He shall be called a Nazarene. (Matthew 2:23) Watch also for the connecting words "for,

because, therefore." These words introduce reasons and results: But when He saw the multitudes, He was moved with compassion on them, BECAUSE they fainted, and were scattered abroad, as sheep having no shepherd. (Matthew 9:36) The words "in, into, and with" are also important connectives. They also indicate relationships between concepts: He turned the sea INTO dry land and they went through the flood on foot: there did we rejoice in Him. (Psalm 66:6).

4. General Structure: As you study paragraphs observe the arrangement of ideas and how the verses relate to each other. Sometimes the author makes a general statement, then explains it with examples. Other times he lists a series of ideas and then summarizes with a general statement. In the example given later in this chapter, you will note that Jude wrote several paragraphs listing characteristics of false teachers. He then gave Old Testament examples which illustrated what he was teaching.
5. Repetitions: Each word of the Bible is inspired by the Holy Spirit. When words or phrases are repeated it is because they are especially important. The Holy Spirit inspired the writers to repeat words and phrases in order to fix them in your memory. The words "verily, verily" are an example of this. When Jesus preceded a statement with these words it was like an announcer saying "May I have your attention please. I have an important announcement to make." Study in detail any words, phrases, or verses that are repeated.
6. Questions And Answers: It is also important to observe the questions and answers of the Bible. Often an author will introduce a subject by asking a question. He will then explain this question and give answers which relate back to the question. A good example of this is Romans 6. Read the entire chapter. Note the questions in verses 1-3 and the answers developed throughout the chapter.
7. Introductions: Watch for paragraphs that introduce the subject that is to follow. For example, in the book of Jude which you studied in the last chapter verse 3 introduces the material to follow: Beloved, when I gave all diligence to write unto you of the common salvation, it was needful for me to write unto you, and exhort you, that ye should earnestly contend for the faith which was once delivered unto the saints. (Jude 1:3) This introductory paragraph explains the purpose of his writing. He is exhorting them to earnestly contend for the true faith. The remainder of the chapter gives reasons for this exhortation. There

are false teachers creeping into the church who are trying to turn them from the true faith.

8. **Summaries And Conclusions:** Be alert for paragraphs that summarize an entire passage, chapter, or even a book. For example, the book of Ecclesiastes contains one verse which summarizes the whole book. In Ecclesiastes the writer has described his quest for life apart from God. His final conclusion is: Let us hear the conclusion of the whole matter: Fear God, and keep His commandments: for this is the whole duty of man. For God shall bring every work into judgment, with every secret thing, whether it be good, or whether it be evil. (Ecclesiastes 12:13-14).
9. **Progressions In Thought:** When studying paragraphs, watch for progressions in thought. Note the following paragraph: And beside this, giving all diligence, add to your faith virtue; and to virtue knowledge; And to knowledge temperance; and to temperance patience; and to patience godliness; And to godliness brotherly kindness; and to brotherly kindness charity. For if these things be in you and abound, they make you that ye shall neither be barren or unfruitful in the knowledge of our Lord Jesus Christ. But he that lacketh these things is blind, and cannot see afar off, and hath forgotten that he was purged from his old sins. (II Peter 1:5-9) There is definite progression in this passage. We are to add one thing to another until we become fruitful.
10. **Literary Form:** Literary form refers to how a passage is written. Some passages are in narrative or story form. This means they read like a story. Other paragraphs are in poetic form (poems) like the passages in the book of Psalms. Some paragraphs are parables which are short stories illustrating a spiritual truth. Some paragraphs are in dramatic form. For example, the Song of Solomon contains dramatic as well as poetic form. Discourse form is much like a sermon. It is a series of paragraphs giving instruction on a certain subject.
11. **Key Words:** Identifying key words will help you understand the meaning of a paragraph. Key words are those important to the meaning of a paragraph. Often they are words which are repeated. Especially note key words which you do not understand. These words can be studied in a word study. (You will learn how to do this later in this course). For example, read the following verse: For there are certain men crept in unawares, who were before of old ordained to this condemnation, ungodly men, turning the grace of our God into

lasciviousness, and denying the only Lord God and our Lord Jesus Christ. (Jude 1:4) Do you know what the word "lasciviousness" means? It is an important word in this paragraph because it describes false teachers. One of their characteristics is that they have turned the grace of God into lasciviousness. This word is an example of a key word to study.

12. Grammatical Construction: The word "grammar" refers to parts of speech or words that fit together to make up sentences and paragraphs. Watch for words which are called verbs. These are words that show action telling what someone did in the past, is doing in the present, or will do in the future. They also are used in commands: GO ye into all the world and PREACH the Gospel to every creature. (Mark 16:15) The words "go" and "preach" are action words. They are verbs. They are commands for us to obey. A noun is a word that names a person, place, or thing. The words in capitals below are nouns: JUDE, the servant of JESUS CHRIST, and brother of JAMES... (Jude 1:1) Nouns tell who and what is involved and where the action took place. A pronoun is a word that replaces or stands for a noun. The words "him" and "her" are examples. Instead of saying "The Holy Spirit inspired Jude to write the book" you could say "The Holy Spirit inspired HIM to write the book." The word "him" is a pronoun standing for the noun Jude.

13. Adjectives and adverbs are important parts of speech also. Adverbs tell something about a verb. It tells how something happened. For example, in the sentence "He ran quickly," the word "quickly" is an adverb because it tells how he ran. An adjective describes a noun or pronoun. If we said "Jude was tall," the word "tall" is an adjective which describes Jude. If you have not studied parts of speech before this may seem confusing at first, but you will soon learn to identify these as you practice. Parts of speech are important because they identify people, places, and things. They tell who did something, where, when, and why. They tell how things were done and what was, is, or will be done. They also provide descriptions and details which increase understanding of the subject matter.

Step 13 Create Paragraph Study Chart

1. By studying paragraphs in detail as described in Step Two, you will identify certain paragraphs that relate to each other. Their relationship may be contrasts, comparisons, progressions, or otherwise. Select these for paragraph study. You will create a chart to summarize your study of these paragraphs. Select a general title for your chart which reflects the relationship of the paragraphs or the subject which they concern. The chart will also include the paragraph titles and divisions made during the chapter study.
2. Record on the chart the book, chapter, and paragraphs studied. Use margins of the chart to make observations and applications.

Step 14 Create Paragraph Outline

1. Use the chart to help you create an outline of the paragraphs. The outlines you create on chapters and paragraphs will help you as you share God's truth with others because they help you present what you have learned in an orderly way.

Step 15-What Further Analysis or Research I Need To Do, Next Time?

Step 16-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?

15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 17-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 11-Verse by Verse Analysis Method

Step 1-Tools Required for this Method

1. Books
2. Study Bible
3. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
4. A Bible dictionary and/or Bible encyclopaedia.
5. A Bible handbook. (Look under the name of the book you are studying as well as under the writer and the city or people to whom the original might have been sent.)
6. Bible atlases
7. Historical
8. Geographies
9. Historical background books
10. Bible surveys
11. Later you may check yourself and your conclusions against what other reliable scholars have done
12. The Illustrated Guide to Biblical History by Kendall Easley (Broadman & Holman)
13. Nelson's New Testament Survey by Mark Bailey and Tom Constable (Nelson)
14. Nelson's Old Testament Survey by Charles Dyer and Eugene Merrill (Nelson)
15. New Testament Survey by Merrill C. Tenney (Eerdmans)
16. New Testament Times by Merrill C. Tenney (Baker)
17. The Old Testament Speaks by Samuel J. Schultz (HarperSanFrancisco)
18. Old Testament Times by R.K. Harrison (Baker)
19. Old Testament Today by John Walton and Andrew Hill (Zondervan)
20. Survey of the Bible by William Hendriksen (Baker)
21. A Survey of the New Testament by Robert H. Gundry (Zondervan)
22. What the Bible Is All About: NIV Edition by Henrietta C. Mears (Regal)
23. Survey — get a bird's-eye view of the book.
24. Analysis — study everything in each chapter in detail.
25. Synthesis — put it back together again and draw some conclusions.

26. Methodical Bible Study by Robert A. Traina (Zondervan) [Very advanced]
27. The Navigator Bible Studies Handbook (NavPress)
28. The New Joy of Discovery in Bible Study by Oletta Wald (Augsburg Fortress)
29. Personal Bible Study by William Lincoln (Bethany Fellowship)
30. Basic Biblical Interpretation by Roy Zuck (Victor)
31. Basics of Bible Interpretation by Bob Smith (Word Books)
32. Getting the Message by Daniel Doriani (Presbyterian & Reformed)
33. Grasping God's Word by Scott Duvall and Daniel Hays (Zondervan)
34. How to Read the Bible for All Its Worth by Gordon Fee and Douglas Stuart (Zondervan)
35. How to Understand Your Bible by T. Norton Sterrett (InterVarsity Press)
36. Protestant Biblical Interpretation by Bernard Ramm (Baker)
37. Studying, Interpreting, and Applying the Bible by Walter Henrichsen and Gayle Jackson (Zondervan)
38. Unlocking the Bible.
39. The-bible-and-the-dead-sea-scrolls.

Step 2-Write Out a Personal Paraphrase

1. Write out the verse in your own words. Do not use one of the modern paraphrases except to get the idea of how to do it. Stay true to the verse you are paraphrasing, and try to condense rather than expand it.

Step 3-List some Questions, Answers and Observations

1. In column 3 of the Chapter Analysis Form at the end of this chapter, list any questions you have relating to words, phrases, persons, topics, and doctrines in that verse. Write down any answers you can find and also record any observations you have. Mark these as follows:
 - Q = Question.
 - A = Answer.
 - O = Observations.

Step 4-Find Some Cross References for Each Verse

1. Using the cross-references from your study Bible or from Scripture memory, write down some cross-references (at least one) for the verse you are studying. Identify the word or phrase you are cross-referencing at the end of this chapter. Use a concordance if you do not have a cross-referenced Bible.

Figure of Speech

1. Review the figure of speech of the following:

- Text.
- Writing.
- Book.
- Journal.
- Article.
- Report.
- Bible.
- Sermon.
- Dissertation.
- Government Documents.
- Theses and Dissertation.
- Newspaper.
- Magazines.
- Audiobook.
- Sermon and Preaching.
- Public Speaking.
- TV.
- Radio.
- Podcast.
- Communication.
- Talk.
- Speak.
- Conversation discussion.
- Debates.
- Discussion.

2. These are the following books to use for Figure of Speech

- **Glossary of Literary Terms by M. H. Abrams.**
- **Figures of Speech used in the Bible by E. W. Bullinger.**
- **Figure of Speech and exploration of used of idiomatic phrases in Conversation by Elizabet Jame Holt.**
- **Figures of Speech by Christina Alm Arvius.**
- **Figures of Speech or Figures of Thought by Ananda Coomaraswamy.**
- **The Princeton Encyclopedia of Poetry and Poetics by Roland Greene.**

Step 5-Record any insights you get from each verse

1. Having thought through the words, phrases, and concepts in the verse, record any insights that you get from them. These could be further observations, words and names that you have looked up and defined, or any other thought that comes to you. Let your imagination go and be as creative as you can in this fifth column, called Personal Application, in the form at the end of this chapter.

Step 6-What Is Immediate Context?

Step 7-What is Whole Context?

Step 8-What Are The Facts Within Context?

Step 9-Write down a brief personal application for each verse

1. Because of the number of verses in your study, you will not be able to design an application project for each verse. Instead, just try to record some devotional thoughts that come to you from each verse. Later, in a devotional Bible study, you can pick one of the thoughts and plan to work on it. Or, if a particular verse seems to meet an immediate need, go ahead and write out an application that is possible, practical, personal, and measurable.

Step 10-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.

5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 11-What Further Analysis or Research I Need To Do, Next Time?

Step 12-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 12 - Book Synthesis Method

Step 1-Tools Required for this Method

1. Books
2. Study Bible
3. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
4. A Bible dictionary and/or Bible encyclopaedia.
5. A Bible handbook. (Look under the name of the book you are studying as well as under the writer and the city or people to whom the original might have been sent.)
6. Bible atlases
7. Historical
8. Geographies
9. Historical background books
10. Bible surveys
11. Later you may check yourself and your conclusions against what other reliable scholars have done
12. The Illustrated Guide to Biblical History by Kendall Easley (Broadman & Holman)
13. Nelson's New Testament Survey by Mark Bailey and Tom Constable (Nelson)
14. Nelson's Old Testament Survey by Charles Dyer and Eugene Merrill (Nelson)
15. New Testament Survey by Merrill C. Tenney (Eerdmans)
16. New Testament Times by Merrill C. Tenney (Baker)
17. The Old Testament Speaks by Samuel J. Schultz (HarperSanFrancisco)
18. Old Testament Times by R.K. Harrison (Baker)
19. Old Testament Today by John Walton and Andrew Hill (Zondervan)
20. Survey of the Bible by William Hendriksen (Baker)
21. A Survey of the New Testament by Robert H. Gundry (Zondervan)
22. What the Bible Is All About: NIV Edition by Henrietta C. Mears (Regal)
23. Survey — get a bird's-eye view of the book.
24. Analysis — study everything in each chapter in detail.
25. Synthesis — put it back together again and draw some conclusions.
26. Methodical Bible Study by Robert A. Traina (Zondervan) [Very advanced]

27. The Navigator Bible Studies Handbook (NavPress)
28. The New Joy of Discovery in Bible Study by Oletta Wald (Augsburg Fortress)
29. Personal Bible Study by William Lincoln (Bethany Fellowship)
30. Basic Biblical Interpretation by Roy Zuck (Victor)
31. Basics of Bible Interpretation by Bob Smith (Word Books)
32. Getting the Message by Daniel Doriani (Presbyterian & Reformed)
33. Grasping God's Word by Scott Duvall and Daniel Hays (Zondervan)
34. How to Read the Bible for All Its Worth by Gordon Fee and Douglas Stuart (Zondervan)
35. How to Understand Your Bible by T. Norton Sterrett (InterVarsity Press)
36. Protestant Biblical Interpretation by Bernard Ramm (Baker)
37. Studying, Interpreting, and Applying the Bible by Walter Henrichsen and Gayle Jackson (Zondervan)

Step 2-Reread the Book

1. Reread the book several times. Read it at one sitting, in a recent translation, rapidly, repeatedly, prayerfully, without referring to commentaries, and with pen or pencil in hand.

Step 3-Write Out a detailed, final outline

1. Compare the horizontal chart and tentative outline you created in your book survey with the passage summaries you created in your chapter analysis studies. Based on this comparison and your recent readings, write out a detailed, final outline of the book. Merrill Tenney gives an excellent example in his book on Bible study methods.

Step 4-Write down a descriptive Book Title

1. From your horizontal chart in the book survey and your detailed, final outline in Step Two, write down a descriptive title for the book you have just studied. Think up an original title that describes in a few words what the book is all about. You might also consult your chapter titles and form a synthesis of them.

Step 5-Make summary of your insights

1. Review and compare the concluding thoughts in each of your chapter analysis studies and summarise what you believe are the major themes and conclusions of the book. Do not refer to commentaries at this point, for these should be your own insights into God's Word. These insights could also include observations gained from your new readings.

Step 6-What Is Immediate Context?

Step 7-What is Whole Context?

Step 8-What Are The Facts Within Context?

Step 9-What Further Analysis or Research I Need To Do, Next Time?

Step 10-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

18. Review all the personal applications you made in your book survey and chapter analysis studies and the possible applications you listed for each chapter. If you haven't fulfilled some of the written applications yet, write those down in this step and make specific plans to carry them out immediately. If you have done them, choose another possible application from the chapter studies or one from your synthetic study and write it out here. Refer to chapter 1 of this book for the ways to do this.

Step 11-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Step 12-Share The Results of your Study with others

1. Bible study should not just be food for your soul and increase your understanding of the Word of God. Its results, including your applications, need to be shared with others. You can do this in two ways:
2. Share with your "Timothy" (or Timothette) in a one-on-one situation. When you get together, share what you are learning from the Bible study, what applications you have been working on, and how he or she too can profit from their own study. The more you give out, the more you will learn yourself.
3. Share with your Bible study group. If you are not in one already, you might want to form a small group in which all of you are studying the same book of the Bible and sharing your findings. This way you will strengthen and help one another in areas of the studies that may not be clear to some in the group.

Method 13 - Theological Study Method

Step 1-Tools Required for this Method

1. Study Bible
2. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
3. Topical Book
4. Exhaustive Concordance
5. Cross Reference
6. Bible theology Books
7. Bibliology Books
8. Theology Books
9. Christology Book
10. Pneumatology Books
11. Angelology Books
12. Demonology Books
13. Satanology Books
14. Anthropology Books
15. Soteriology Books
16. Ecclesiology Books
17. Eschatology Books

Step 2 Select The topic

1. The following outline of Biblical theology will assist you in selecting topics for use in the theological method of Bible study:
2. Biblical Theology
 - Bibliology: The study of the doctrine of the Bible.
 - Origin.
 - Revelation.
 - Inspiration.
 - Authority.
 - Illumination (how the Holy Spirit illuminates or helps us understand the Bible).
 - Interpretation.
3. Theology: Study of God the Father.
 - The attributes of God.
 - The works of God.
 - The names of God.
 - The triune nature of God.

4. Christology: The study of the doctrine of Jesus Christ.

- The attributes of Jesus.
- The works of Jesus.
- The names of Jesus.
- The triune nature of Jesus.
- His life in the flesh:
 - A. Birth and childhood.
 - B. Baptism.
 - C. Temptation.
 - D. Transfiguration.
 - E. Teachings.
 - F. Miracles.
 - G. Sufferings and death.
 - H. Resurrection.
 - I. Ascension.
- The second return of Jesus Christ.
- The messianic kingdom.
- The deity of Jesus: The study of how Jesus was both divine and human, In one person.
- His preexistence with God the Father.
- Old Testament types of Jesus Christ.

5. Pneumatology: The study of the doctrine of the Holy Spirit.

- The attributes of the Holy Spirit.
- The work and ministry of the Holy Spirit.
 - A. In the Old Testament.
 - B. In the New Testament.
 - C. In the present Church age.
- The names of the Holy Spirit.
- Preexistence of the Holy Spirit with God the Father.
- Triune nature of the Holy Spirit.
- The Holy Spirit in the Old Testament contrasted with the Holy Spirit in the New Testament.
- Types and symbols of the Holy Spirit.
- Gifts of the Holy Spirit.

- Fruit of the Holy Spirit.
 - Baptism in the Holy Spirit.
6. Angelology: The study of good angels, the angels of God:
 - Their structure and organisation.
 - Names of angels.
 - The work of angels: Past, present, future.
 7. Demonology: The study of wicked angels who are the demons of Satan:
 - Origin.
 - Structure and organisation.
 - Names.
 - Work: Past, present, future.
 - Judgment and destination.
 8. Satanology: Study of Satan:
 - Origin.
 - Fall.
 - Names.
 - Work: Past, present, future.
 - Judgment and destination.
 9. Anthropology: The study of the origin and nature of man:
 - The origin of man.
 - The fall of man.
 - The sin nature of man.
 - God's remedy for man's sin.
 10. Soteriology: The study the doctrine of salvation.
 - The development of the plan of Salvation: Traced from the first promise of salvation in Genesis 3:15 throughout the Bible.
 - Study of the Saviour, Jesus Christ (see God the Son Jesus Christ, Cristology).
 - The finished work of the Saviour.
 - The terms of salvation.

11. Ecclesiology: This is the study of the doctrine of the Church. It focuses on all the Bible teaches regarding the spiritual Body of Jesus Christ which is called the Church:

- The Church as an organism: The body of Christ.
- The contrast between Israel and the Church.
- The organisation of the Church:
 - A. Ordinances.
 - B. Order.
 - C. Structure.
 - D. Service.
 - E. Doctrine of the church.

12. Eschatology: Study of the last events which are to happen before eternity begins:

- Prophecy concerning the Church.
- Prophecy concerning Israel.
- Prophecy concerning other nations of the world.
- Prophecy concerning the Messiah: His returns and establishing of His kingdom.
- The resurrections of the dead.
- The judgments.
- The tribulation.
- The millennium.
- The eternal states of the righteous and the unrighteous.

Step 3-Define The doctrine Selected

1. The definitions of basic Bible doctrines are given in the preceding outline. These include Christology, pneumatology, theology, Bibliology, angelology, demonology, satanology, anthropology, soteriology, ecclesiology, and eschatology.

Step 4-Select the Bible Portion to be studied

1. Decide the book or books of the Bible in which you will study this doctrine. Books of the New Testament are the best to use for theological research. The Old Testament is largely prophetic or in narrative (story) form. The New Testament, especially the Gospels and the Letters, provide much material for theological Bible study.

Step 5-Gather information on the doctrine

1. Use what you have learned about book, chapter, paragraph, verse, and word studies to help you gather information on the doctrine which you are studying. As you read, make notations on everything the Scriptures reveal about the doctrine.

Step 6-Summarise the information you gathered

1. Summarise the information you recorded during Bible study. Use the outline on theology given in this chapter to help you organize your study notes into an outline or chart.

Step 7-What Is Immediate Context?

Step 8-What is Whole Context?

Step 9-What Are The Facts Within Context?

Step 10-What Further Analysis or Research I Need To Do, Next Time?

Step 11-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?

12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 12-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 14-Studying Bible Prophecy

Step 1-Tools Required for this Method

1. Study Bible
2. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
3. Topical Book
4. Exhaustive Concordance
5. Cross Reference

Step 2-Define Prophecy

1. The word "prophecy" means to speak forth. Bible prophecy includes three basic kinds of speaking forth:
 - A message of inspiration from God.
 - Prediction of future events in God's eternal plan.
 - An interpretation for man of the acts of God.

Step 3-Method of Prophecy

1. THE SPOKEN WORD:
 - The method most often used was the spoken word. God would tell the prophet the words to speak. For example, God said to the prophet Jeremiah: . . . for thou shalt go to all that I shall send thee, and whatsoever I command thee thou shalt speak. (Jeremiah 1:7) Throughout the book of Jeremiah God's instructions to him were.
 - Go and cry in the ears of Jerusalem, saying, Thus saith the Lord. (Jeremiah 2:2).
 - Jeremiah spoke the words which God told him to speak.
2. ACTED PROPHECIES:
 - In addition to spoken prophecy, God had the prophets visually act out a message. For example, God told Jeremiah to: . . . Make thee bonds and yokes and put them upon thy neck. . . (Jeremiah 27:2).

- These yokes were a visual prophecy of the yokes of bondage which were to come on the people because of their sin. Jeremiah acted out the prophetic message of God.

Step 4-Source of Prophecy

1. The source of Biblical prophecy is God who reveals His message to man through the Holy Spirit: For the prophecy came not in old time by the will of man; but holy men of God spake as they were moved by the Holy Ghost. (II Peter 1:21).
2. But God hath revealed them unto us by His Spirit: for the Spirit searcheth all things, yea, the deep things of God. (I Corinthians 2:10).
3. God can speak accurately of the future because: Known unto God are all His works from the beginning of the world. (Acts 15:18).
4. Remember the former things of old: for I am God, and there is none else; I am God, and there is none like me. Declaring the end from the beginning, and from ancient times the things that are not yet done, saying, My counsel shall stand, and I will do all my pleasure. (Isaiah 46:9-10).
5. God raises up true prophets: The Lord thy God will raise up unto thee a Prophet from the midst of thee, of thy brethren, like unto me; unto him ye shall hearken. (Deuteronomy 18:15).
6. God reveals His future plans to these prophets: Surely the Lord God will do nothing but He revealeth His secret unto His servants the prophets. (Amos 3:7).

Step 5- False Prophets

1. Satan imitates true prophecy through false predictions by fortune tellers, witches, and astrologers. These methods are not of God. The Prophet Daniel said: Daniel answered in the presence of the king and said, The secret which the king hath demanded cannot the wise men, the astrologers, the magicians, the soothsayers shew unto the king.
2. But there is a God in heaven that revealeth secrets and maketh known to the king Nebuchadnezzar what shall be in the latter days. . . (Daniel 2:27-28).
3. True prophecy directs attention to Jesus Christ: Wherefore I give you to understand, that no man speaking by the Spirit of God calleth Jesus accursed;

and that no man can say that Jesus is the Lord, but by the Holy Ghost. (I Corinthians 12:3).

4. The Bible warns of false prophets (Matthew 24:11,24; Mark 13:22). A person called "the false prophet" will be evident in events at the end of the world (Revelation 13:11-17; 16:13; 19:20; 20:10). The Bible reveals several ways to identify false prophets:
 - They teach sexual immorality and permissiveness: II Peter 2:13.
 - They try to lead people away from obedience to God's Word: Deuteronomy 13:1-5.
 - They make false claims: Matthew 24:23-24.
 - They deceive people with miraculous signs: Matthew 24:11,24.
 - They do not prophecy according to the proportion of faith (in right relation to God's Word): Romans 12:6.
 - False prophets do not have the fruit of the Holy Spirit in their lives: Matthew 7:15-16; Galatians 5:22-23.
 - What they prophesy does not come to pass: Deuteronomy 18:20-22.

Step 6-Purpose of Prophecy

1. TO AUTHENTICATE GOD'S MESSAGE: Fulfilled prophecy proves that God's message is authentic (true). In Isaiah 41:21-23 God challenges the gods of the heathen nations to prove their power by foretelling future events. They could not do it because they were false gods: Produce your cause, saith the Lord; bring forth your strong reasons, saith the King of Jacob. Let them bring them forth, and shew us what shall happen: let them shew the former things, what they be, that we may consider them, and known the latter end of them; or declare us things for to come. Shew the things that are to come hereafter, that we may know that ye are gods. (Isaiah 41:21-23).
2. TO CONFIRM GOD'S MESSENGER: Prophecy confirms the true messengers of God: The prophet which prophesieth of peace, when the word of the prophet shall come to pass, then shall the prophet be known, that the Lord hath truly sent him. (Jeremiah 28:9).
3. TO INSTRUCT BELIEVERS: Believers are to receive instruction from prophecy and take heed (pay attention) to it: We have also a more sure word of prophecy; whereunto ye do well that ye take heed, as unto a light that shineth in a dark place. . . (II Peter 1:19).
4. IMPORTANCE OF STUDYING PROPHECY There are three main reasons why it is important to study Bible prophecy:
 - All Scripture is inspired of God and is profitable for study: All Scripture is given by inspiration of God, and is profitable for doctrine, for reproof, for correction, for instruction in righteousness; That the man of God may be perfect, thoroughly furnished unto all good works. (II Timothy 3:16-17).
 - Prophecy brings understanding of past, present, and future events in the plan of God: . . . the things which thou hast seen, and the things which are, and the things which shall be hereafter. (Revelation 1:19).
 - Understanding of God's future plan prevents deception by Satan: Then if any man shall say unto you, Lo, here is Christ, or there; believe it not. For there shall arise false Christs, and false prophets, and shall shew great signs and wonders: insomuch that, if it were possible, they shall deceive the very elect. BEHOLD, I HAVE TOLD YOU BEFORE. Wherefore if they shall say unto you, behold He is in the desert; go not forth: behold He is in the secret chambers; believe it not. (Matthew 24:23-26) God's future plan has been shared before it happens so we will not be deceived by Satan.

- There is a special blessing pronounced upon those who study Bible prophecy: Blessed is he that readeth, and they that hear the words of this prophecy, and keep those things which are written therein: for the time is at hand. (Revelation 1:3).

Figure of Speech

1. Review the figure of speech of the following:

- Text.
- Writing.
- Book.
- Journal.
- Article.
- Report.
- Bible.
- Sermon.
- Dissertation.
- Government Documents.
- Theses and Dissertation.
- Newspaper.
- Magazines.
- Audiobook.
- Sermon and Preaching.
- Public Speaking.
- TV.
- Radio.
- Podcast.
- Communication.
- Talk.
- Speak.
- Conversation discussion.
- Debates.
- Discussion.

2. These are the following books to use for Figure of Speech

- **Glossary of Literary Terms by M. H. Abrams.**
- **Figures of Speech used in the Bible by E. W. Bullinger.**
- **Figure of Speech and exploration of used of idiomatic phrases in Conversation by Elizabet Jame Holt.**
- **Figures of Speech by Christina Alm Arvius.**
- **Figures of Speech or Figures of Thought by Ananda Coomaraswamy.**
- **The Princeton Encyclopedia of Poetry and Poetics by Roland Greene.**

Step 7-Study of Prophecy

1. Bible prophecy is part of the "meat" of the Word of God which we referred to previously in this course. The "meat" of prophecy is more difficult to understand than the "milk" of God's Word which presents basic concepts of the Christian faith. If you are a new believer and do not have any background knowledge of the Bible, you should study other portions of God's Word before you try to study the prophetic books. Study the Gospels, Acts, and Letters of the New Testament. Study the Poetry, Law, and History divisions of the Old Testament. As you study, use what you have learned in this course about book, chapter, paragraph, verse, and word study. After you have a basic knowledge of these divisions, then study the prophetic books of the Bible. Do not worry if you do not understand all of the prophecies in the Bible. Many great Bible scholars have debated for years about the meaning of some portions of Bible prophecy.

Step 8-Prophetic Books

1. In addition to the books of prophecy there are many other chapters and verses of prophecy scattered throughout God's Word. The very first prophecy recorded in the Bible is in the book of Genesis: And I will put enmity between thee and the woman, and between thy seed and her seed: it shall bruise thy head, and thou shalt bruise His heel. (Genesis 3:15)
2. This verse prophesies the coming of Jesus Christ who, through His death for the sins of man, would crush the enemy, Satan. It is not possible to list in this manual every prophecy in the Word of God. We just want you to be aware that there are prophecies throughout the entire Bible. Prophecy is not just confined to the books known as the Books of Prophecy. With study and experience you will be able to identify the prophetic theme that runs throughout the entire Bible.

Step 9-Understanding Prophecy

1. Some people are frustrated when they try to study Bible prophecy. Because prophecy is more difficult than other portions of the Bible, they wonder if God really intended for them to understand it. It is possible to understand Bible prophecy. God wanted so much for Daniel to understand prophecy that he sent an angel to explain it to him. The angel said: . . . I am now come forth to give thee skill and understanding.(Daniel 9:22).
2. Jesus took time to explain Old Testament prophecy to His Disciples: And He said unto them, These are the words which I spake unto you, while I was yet with you, that all things must be fulfilled, which were written in the law of Moses, and in the prophets, and in the psalms concerning me. (Luke 24:44)
3. When the Disciples asked Jesus about the end of the world, Jesus listed several prophetic signs for which they were to watch. He wanted them to understand future events. Jesus said: So likewise ye, when ye shall see all these things, know that it is near, even at the doors. (Matthew 24:33).
4. In the introduction to the book of Revelation, a book which some consider quite difficult to understand, it is clear that God wants His people to understand prophecy: The Revelation of Jesus Christ which God gave unto Him, to shew unto His servants things which must shortly come to pass. . . (Revelation 1:1).

Step 10-What Is Immediate Context?

Step 11-What is Whole Context?

Step 12-What Are The Facts Within Context?

Step 13-Keys to Understanding

1. ONE: THE BASIC THEME OF PROPHECY The Lord Jesus Christ is the basic theme of Bible prophecy. There are many other subjects of Bible prophecy. For example, there are prophecies of judgment of wicked nations by God. But the underlying theme of all Bible prophecies is that they somehow relate to Jesus and the purpose of God regarding Him: Having made known unto us the mystery of His will, according to His good pleasure which He hath purposed in Himself; That in the dispensation of the fullness of times He might gather together in one all things in Christ, both which are in heaven, and which are on earth; even in Him. (Ephesians 1:9-10) All Bible prophecy, even when it deals with subjects such as judgment upon nations, etc., relates to the overall plan of God. That plan is to bring all mankind into right relationship with God through the Lord Jesus Christ. The purpose is to gather in one all things in Christ. The Bible states that the "spirit" or theme of Bible prophecy is Jesus: . . . for the testimony of Jesus is the spirit of prophecy. (Revelation 19:10) When you study Bible prophecy consider it in terms of this question: How does this prophecy relate to Jesus Christ (the spirit of prophecy) and God's overall plan concerning Him?
2. TWO: THE BIBLE INTERPRETS ITSELF Another key to understanding is to realize that often the Bible explains its own prophecies. For an example of how the Bible interprets itself read Daniel chapter 2. Here a king by the name of Nebuchadnezzar is given a dream from God. Upon waking he cannot remember the dream. He calls upon the astrologers and magicians to recall and interpret the dream. They cannot do it. Then God uses the prophet Daniel to tell the king what he dreamed and interpret it for him. The dream is described by Daniel in verses 31-35. The interpretation of the dream is given in verses 36- 45. This is an example of how, in many passages, the Bible interprets its own prophecies. The New Testament interprets many of the prophecies of the Old Testament because much of the Old Testament is fulfilled in the New Testament. For example, compare this Old Testament prophecy and the New Testament fulfillment: . . . and I will say to them which were not my people, Thou art my people, and they shall say, Thou art my God. (Hosea 2:23) Even us, whom He hath called, not of the Jews only, but also of the Gentiles? As he saith also in Osee, I will call them my people, which were not my people; and her beloved, which was not beloved. And it shall come to

pass that in the place where it was said unto them, ye are not my people; there shall they be called the children of the living God. (Romans 9:24-26) Fulfilled prophecy in the New Testament includes many Old Testament prophecies concerning the coming Messiah, Jesus Christ.

3. **THREE: THE RULE OF DOUBLE REFERENCE** Another key to understanding Bible prophecy is the "rule of double reference." This rule for interpreting Bible prophecy states that a prophecy of immediate fulfillment is made as a means of teaching a deeper truth or foretelling an event to be fulfilled farther in the future. Many times in the Bible a prophecy was fulfilled immediately after it was given, but the same prophecy applied not only to the event which was fulfilled immediately, but also to a second fulfillment farther in the future. For example, there is a prophecy given in Ezekiel 28:1-19 which is addressed to Ethbaal who was then the king of Tyre. He was a wicked king. He was a type of the Antichrist who will arise during the end of the world. By saying Ethbaal is a "type" we mean that in nature and actions he was like the Antichrist which will come in the future. (You will learn more about "types" in the next chapter.) When God spoke in prophecy through Ezekiel, it was fulfilled in the immediate future in the life of Ethbaal. But there is a future event, as yet unfulfilled, where the same prophecy applies to the evil end time ruler called the Antichrist. As you study Bible prophecy remember this rule of double reference. Ask yourself two questions:

- What did this prophecy mean at the time it was given for the people to whom it was given?
- Is there a future double reference in this prophecy?

4. **FOUR: PROPHETIC PERSPECTIVE** The prophets described future events as if they were continuous and in immediate order. For example, Isaiah prophesied: The Spirit of the Lord God is upon me; because the Lord hath anointed me to preach good tidings unto the meek; He hath sent me to bind up the broken hearted, to proclaim liberty to the captives, and the opening of the prison to them that are bound; To proclaim the acceptable year of the Lord, and the day of vengeance of our God; to comfort all that mourn; To appoint unto them that mourn in Zion, to give unto them beauty for ashes, the oil of joy for mourning, the garment of praise for the spirit of heaviness; that they might be called trees of righteousness, the planting of the Lord, that He might be

glorified. (Isaiah 61:1-3) When Jesus read from this portion of Isaiah in Luke 4:17-20 He stopped with the phrase "to proclaim the acceptable year of the Lord." Then He closed the book and said that these Scriptures were fulfilled in Him that day. By this He meant that He was fulfilling this prophecy. He was the one with God's Spirit upon Him to preach good tidings, bind up the broken hearted, proclaim liberty, and open the prisons. But it is significant that Jesus stopped reading with the phrase "to proclaim the acceptable year of the Lord." He did not read the portion regarding "the day of vengeance of our God" because the day of vengeance had not yet come. Already a gap of almost 2,000 years has elapsed since Jesus read this passage. The day of God's vengeance still has not yet come. Prophetic perspective records events as if they were immediate. Through the revelation of the Holy Spirit Isaiah saw the whole plan of God. He saw Jesus coming to preach, bind up, proclaim liberty, open the prison, proclaim the acceptable year of the Lord, and bring the vengeance of God. Isaiah saw the events as you would look at distant ranges of mountains. The valleys in between the mountains are not visible until you climb to the top of the nearest range. Prophetic perspective reveals the whole plan of God from a distance. Sometimes events seem to appear as though they happen immediately in sequence. But as the prophecies are fulfilled there are often valleys of time between them as illustrated by this passage from Isaiah. Jesus has not yet fulfilled the Scriptures about the day of vengeance.

5. FIVE: THE CONDITIONAL NATURE OF PROPHECY Much Bible prophecy is conditional in nature. This means that God says He will do certain things based on the response of man. IF man does NOT listen to God's message, certain things will happen. IF man HEARS God's message and RESPONDS properly to it, then something else will happen. God said: At what instant I shall speak concerning a nation, and concerning a kingdom, to pluck up, and to pull down, and to destroy it; IF that nation, against whom I have pronounced, turn from their evil, I will repent of the evil that I thought to do unto them. And at what instant I shall speak concerning a nation, and concerning a kingdom, to build and to plant it, IF it do evil in my sight, that it obey not my voice, then I will repent of the good, wherewith I said I would benefit them. (Jeremiah 18:7-10) In much Bible prophecy, you must continue studying in order to discover man's response to it because the fulfillment of prophecy is often conditional upon man's response. For a good example of this principle read the book of Jonah.

The Prophet Jonah revealed that God would destroy Ninevah in three days IF they did not repent. The destruction never came. The reason was that Ninevah responded properly to the message of God and repented of their sins.

6. OLD TESTAMENT PROPHECY Prophecy in the Old Testament centers on:

- The people of Israel which was the nation God raised up through which to reveal Himself to the world. During the period of time when Israel was divided into two kingdoms this prophecy is directed to Israel and Judah. An example of prophecy to Israel is the book of Hosea. An example of prophecy to Judah is the book of Joel.
- Prophecies to the nations surrounding the people of Israel. For example, prophecies are given regarding Babylon, Egypt, Tyre, Edom, etc. An example is the prophecy of Obadiah directed to the nation of Edom.
- Prophecies concerning the coming Messiah, Jesus Christ. These are not contained in any one prophetic book. They are scattered throughout the Old Testament. A good example is Isaiah 7:14.
- Prophecies concerning the entire world, its destiny, future events, the end of the world, and the end of time as we know it. The book of Daniel is an excellent example of this type of prophecy. The following chart condenses the general content of the books of prophecy in the Old Testament. As you use this chart be sure to remember the rule of double reference. Although prophecies were directed to certain nations and fulfilled in the immediate future, many of the prophecies spoke of even greater events in the far future:

7. NEW TESTAMENT PROPHECY There are many prophecies scattered throughout the New Testament. Most of these deal with future events which are to happen prior to the end of the world. For examples read the prophecies in Matthew chapter 24. There is only one book in the prophecy division in the New Testament, however. That is the book of Revelation. John, a Disciple of Jesus, was given this revelation from God through the Holy Spirit. It is a revelation of Jesus Christ: The Revelation of Jesus Christ, which God gave unto him, to shew unto his servants things which must shortly come to pass. . . (Revelation 1:1) John was told to. . . Write the things which thou hast seen, and the things which are, and the things which shall be hereafter. (Revelation

1:19) The Book of Daniel should be studied along with the book of Revelation as the two books relate to each other. There are many different interpretations given to the prophecies in the book of Revelation. Most of these interpretations center on the exact timing of certain events or specific details of these events. It is important to have a general understanding, however, of what the Bible says will happen. The following outline provides understanding of the major events: MAJOR EVENTS IN THE FUTURE.

- The Bible teaches that Jesus will return to earth for believers: John 14:2-3.
 - A. The Rapture: I Thessalonians 4:13-18 gives the most detail about Christ's return for believers. This return is called the rapture:
 - Christ Himself will return: Verse 16.
 - There will be a resurrection from the grave of those who were believers when they died: Verse 16.
 - There will be rapture, which means "the act of taking a person from one place to another." Living believers will be taken from earth to meet Jesus: Verse 17.
 - There will be a reunion between believers who have previously died, believers living at the time of Christ's return, and the Lord Jesus Christ: Verse 17.
8. The Tribulation: The Bible tells of a terrible time on earth which is called the tribulation.
- The tribulation will last for 42 months or 1,260 days: Daniel 9:24-27.
 - It will be a very difficult time. There have been many difficult times in the world, but three things will distinguish the tribulation from all other times of trouble.
 - A. First, it will be worldwide and not just local: Revelation 3:10.
 - B. Second, people will realize the end of the world is near: Revelation 6:16.
 - C. Third, the intensity of the trouble will be greater than ever before experienced: Matthew 24:4-14.
 - Its description: There are a series of judgments on earth during the tribulation. These are described in Revelation chapters 6, 8-9, and 16 and Matthew 24:4-14.

- The reason for the tribulation: The wickedness of man must be punished, Satan defeated, and Jesus acknowledged as Lord of all. This completes God's plan of the ages spoken of in Ephesians 1:8-9.
9. The timing of the rapture: Some people believe the rapture will occur before the tribulation and that believers will not have to experience any of this terrible time on earth. Others believe the rapture will happen midway through this period. Still other believe the rapture will happen at the end of the tribulation. The most common interpretation is that the rapture of believers will happen before the tribulation begins. The different views of the timing of the rapture result from various interpretations of prophetic information given in Revelation and other books of the Bible. What is most important is to know you are a true believer and will be ready to go with Jesus in the rapture when it does occur.
 10. The Millennium: The Millennium is a period of 1,000 years after the tribulation during which Jesus will rule the earth in righteousness (Zechariah 14:9; Daniel 7:14). The city of Jerusalem will be the center of government (Isaiah 2:3). This period will end when Satan stages a last revolt against God (Revelation 20:7-9). God will send fire from heaven and end all opposition. Satan will be cast into the lake of fire for eternity. (Revelation 20:10).
 11. Judgment: All created beings will be judged by God. This is known as the time of eternal judgment. Those who died as unbelievers will be resurrected to face judgment. Because they did not repent from sin and accept Jesus as Savior they will be condemned to eternity in Hell (Revelation 20:12-15). True believers who repented from sin and accepted Jesus as Savior will spend eternity in heaven in the presence of God (Revelation 21).

Step 14-What Further Analysis or Research I Need To Do, Next Time?

Step 15-Write out a Personal Application

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 16-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarise its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 15-Typological Study Method

Step 1-Tools Required for this Method

1. Study Bible
2. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
3. Topical Book
4. Exhaustive Concordance
5. Cross Reference

Step 2-Define Method

1. To understand how to do a typological study you must first understand the meaning of the word type. There are several verses in the Bible which explain the meaning of a Biblical type.
2. Key Verse for this chapter, Hebrews 10:1, speaks of the law having a shadow of good thing to come. "Shadow" is one word to describe a Biblical type. A shadow is an exact outline, although the details may be dim and sometimes it contrasts the thing that casts the shadow.
3. "Figure" is another word which describes type: Nevertheless death reigned from Adam to Moses, even over them that had not sinned after the similitude of Adam's transgression, who is the figure of Him that was to come. (Romans 5:14).
4. According to this verse, Adam was a "figure" of someone else who was to come. The meaning of the word "figure" is similar to that of type. Adam was a type of the Lord Jesus Christ who was to come later. The offering of sacrifices for sin in the Old Testament was a type of the final sacrifice for sin which was to be offered by Jesus in the New Testament:
5. The Holy Ghost thus signifying that the way into the holiest of all was not yet made manifest, while as the first tabernacle was yet standing: Which was a figure for the time then present, in which were offered both gifts and sacrifices that could not make him that did the service perfect, as pertaining to the conscience. (Hebrews 9:8-9) "Pattern" is another word describing Biblical

types: For if he were on earth, he should not be a priest, seeing that there are priests that offer gifts according to the law; Who serve unto the example and shadow of heavenly things, as Moses was admonished of God when he was about to make the tabernacle: for, See, saith he, that thou make all things according to the pattern shewed to thee in the mount. (Hebrews 8:4-5) Each of these words--shadow, figure, and pattern--all contain the idea we refer to when we speak of types. A type is a person or thing in the Bible which God used to represent some other person, thing, or event that would appear in the future. It was a shadow, a figure, or a pattern of what was to come.

Step 3-Method Explained

1. When we study these types it is called typological Bible study. We study a person, place, event, or thing and then we study the thing of which it is a type. In a way, types are like prophecy. They give an advance view of what is to come in God's future plan. Like prophecy, some types have been fulfilled. Others remain to be fulfilled. Although the type is important in itself, it has an even greater significance in the future person or event which it represented. Types are physical pictures of spiritual realities. For example, the experience of the children of Israel being healed from the bites of serpents is an actual Old Testament event. The Old Testament account in Numbers 21:6-9 tells that serpents bit the people and caused many of them to die. Moses made a bronze serpent and set it on a pole. Everyone who looked at the bronze serpent recovered from the serpent's bite. This event is a type of the death of Jesus: And as Moses lifted up the serpent in the wilderness, even so must the Son of man be lifted up; that whosoever believeth in Him should not perish, but have eternal life. (John 3:14-15) Many of the truths of the Bible are so simply stated that a child can understand them. There are other truths that are "hidden riches of secret places." They require more intense study to understand. The typical teachings of the Bible are like hidden riches. You must take time to search out these truths to discover the richest teachings of the Word of God. All types fall into four general classifications:

- Persons.
- Places.
- Events (historical, ceremonial, etc.).
- Material things.

Step 4-What Is Immediate Context?**Step 5-What is Whole Context?****Step 6-What Are The Facts Within Context?****Step 7-Write out a Personal Application**

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 8-What Further Analysis or Research I Need To Do, Next Time?**Step 9-Meditate on Verse you have chosen to study**

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarize its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 16-John MacArthur Way Bible

Study

Step 1-Read or Listen Bible on repetitious basis

1. Take any Book of Bible and Divide the book equally into 4-8 chapters.
2. Read or listen every day for the next 30-90 days all those 4-8 chapters.
3. Read or Listen 4-8 chapters as many time per day as possible.
4. In 2.5 years you could listen or read entire New Testament.
5. Repetitious reading or listen leads to remember the text better.

Step 2-Tools need

1. Expository or ordinary Bible commentaries-have between 1-50 commentaries on the text you study.
2. Treasure of scripture knowledge.
3. Handbooks.
4. Dictionary.
5. Cross References.
6. Atlas.
7. Doctrinal issues.
8. Books on custom.
9. Books on Culture.
10. Books on economy.
11. Books on political.
12. Books on geography.
13. Books on social.
14. Books on reconstructing the time.
15. Concordance.
16. Biblical greek dictionary.
17. Biblical Hebrew Dictionary.
18. Biblical Greek text.
19. Biblical Hebrew text.

20. Biblical Hebrew Grammar-Beginners to Advanced.
21. Biblical Greek Grammar-Beginners to Advanced.
22. Life and time of Jesus the Messiah.
23. Biography and History on Life and time of Paul, Peter, John, Luke, Matthew, Mark and other apostles.
24. Topical Study.

Step 3-Old Testament-Read in narrative

1. Read or Listen Through Old Testament 1-100 times.
2. Themes of Old Testament.
 - Scripture is God's self disclosure. Note in mind what is true about God.
 - Scripture points out that God has Law which man violates.
 - Scripture reveal who keeps the law of God.
 - Saviour Coming.

Step 4-Every Scripture has one true interpretation

1. Exegesis - draw out of text.
2. Epexegetis-put in the text your own ideas (Do not Use it for interpretation).
3. Bible best interpreting itself.

Step 5-Things to avoid in interpretation

1. What does it mean to me? (This is not the question to ask while study, read or listen Bible).
2. Refrain to make a point for the correct interpretation (Taking text out of the correct context and interpreting).
3. Do not over spiritualise the text or do not over allegorise the text.
4. Do not use Bible and abused.
5. Avoid superficial study.
 - This is hard work.
 - Try to piece together the information.
 - Meaning is clear, but it takes hard work to get it.

Step 6-Observation

1. What does the text mean?
2. What the author intent (author intent) and divine author intent?
3. What it means to the author?
4. What it mean to the audience?
5. 5W1H?
6. What it not said in the passage?

Step 7-Literal Principle

1. Real people.
2. Real history.
3. Normal language.
4. Real meaning.
5. Interpret the scripture to normal language.
6. Figure of Speech.
 - These are the following books to use for Figure of Speech.
 - I. **Glossary of Literary Terms by M. H. Abrams.**
 - II. **Figures of Speech used in the Bible by E. W. Bullinger.**
 - III. **Figure of Speech and exploration of used of idiomatic phrases in Conversation by Elizabet Jame Holt.**
 - IV. **Figures of Speech by Christina Alm Arvius.**
 - V. **Figures of Speech or Figures of Thought by Ananda Coomaraswamy.**
 - VI. **The Princeton Encyclopaedia of Poetry and Poetics by Roland Greene.**

Step 8-Analysis of Logic.

Step 9-Analysis of Grammar.

Step 10-Discourse Analysis of The Text

- A. Use the Following Books for Discourse Analysis:
 - Critical Discourse Analysis_ The Critical Study of Language.
 - Discourse analysis.
 - The Routledge handbook of discourse analysis.

Step 10- Analysis of Genre.

A. Open Figure Of Speech Folder. Use the Following Books for Analysis of Genre :

- Literary Device.
- FIGURES OF SPEECH - Biblical Research Journal.
- Figures of Speech.

Step 11- Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context
4. Historical Principle.
 - Context is very important.
5. Cultural Context.
6. Custom Context.
7. Economic Context.
8. Geographical context.
9. Political context.
10. Religious context.
11. What world view they have?
12. How people think?
13. What problems they faced?
14. Perspective of people?
15. What is going on at the time?
16. What historical city?
17. What social pressure?
18. What cultural condition?
19. Where was tension?
20. What location?
21. What were crisis?
22. Grammatical Principle.
 - Look at the language.
 - Lexicography.
 - Find out the way words arrange.
 - Proposition pronoun.
 - Analyse the English Bible grammatically.

- Analyse the original Bible language (Greek, Hebrew and Aramaic)
- Word Meaning.
 - A. Word meaning studies.
 - B. Analyze word meaning.
 - C. Syntax analysis- how the words constructed.
 - D. Know greek and Hebrew languages.
- Look for main verb.

23. Logical Principle.

- Definition.
- Terms.
- Arguments.
- All logical principles involved analysing arguments.

24. Synthesis principle.

- Scripture interpret scripture.
 - A. Use Treasury of Scripture Knowledge.
- Compare with related text.

Step 12-What Are The Facts Within Context?

Step 13-Implication

- What are implication of this?

Step 14-What Further Analysis or Research I Need To Do, Next Time?

Step 15-Write out a Personal Application.

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?

14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.
17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 16-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarise its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 17-Inductive Bible Study Method

Step 1-Tools Required for this Method.

1. Study Bible
2. Exhaustive concordance
3. Treasury of Scripture Knowledge Topical Bible
4. A Bible dictionary and/or Bible encyclopaedia
5. A Bible handbook
6. A Bible atlas
7. Archaeology and Bible History by Joseph Free and Howard Vos (Zondervan)
8. The Bible and Archaeology by J.A. Thompson (Eerdmans)
9. Everyday Life in Bible Times (National Geographic Society)
10. Great People of the Bible and How They Lived (Reader's Digest Association)
11. Harper's Encyclopedia of Bible Life by Madeleine S. and J. Lane Miller (Books Sales)
12. The Oxford History of the Biblical World by Michael Coogan (Oxford University Press)
13. The Wycliffe Historical Geography of Bible Lands by Howard Vos (Hendrickson)
14. Church History
15. The Bible Knowledge Background Commentary, edited by Craig Evans, 3 vols. (Victor)
16. Chronological and Background Charts of the New Testament by H. Wayne House (Zondervan)
17. Chronological and Background Charts of the Old Testament by John Walton (Zondervan)
18. The IVP Bible Background Commentary: New Testament by Craig Keener (InterVarsity Press)
19. The IVP Bible Background Commentary: Old Testament by John Walton et al. (InterVarsity Press)
20. Manners and Customs in the Bible by Victor H. Matthews (Hendrickson)
21. The Zondervan Illustrated Bible Background Commentary: New Testament, edited by Clinton Arnold, 4 vols. (Zondervan)

22. The Zondervan Illustrated Bible Background Commentary: Old Testament, edited by John Walton, 4 vols. (Zondervan)
23. Several contemporary translations. (These enable you to see different renderings of the same material by able scholars.)
24. A Bible dictionary and/or Bible encyclopaedia.
25. A Bible handbook. (Look under the name of the book you are studying as well as under the writer and the city or people to whom the original might have been sent.)
26. Bible atlases
27. Historical
28. Geographies
29. Historical background books
30. Bible surveys
31. Later you may check yourself and your conclusions against what other reliable scholars have done
32. The Illustrated Guide to Biblical History by Kendall Easley (Broadman & Holman)
33. Nelson's New Testament Survey by Mark Bailey and Tom Constable (Nelson)
34. Nelson's Old Testament Survey by Charles Dyer and Eugene Merrill (Nelson)
35. New Testament Survey by Merrill C. Tenney (Eerdmans)
36. New Testament Times by Merrill C. Tenney (Baker)
37. The Old Testament Speaks by Samuel J. Schultz (HarperSanFrancisco)
38. Old Testament Times by R.K. Harrison (Baker)
39. Old Testament Today by John Walton and Andrew Hill (Zondervan)
40. Survey of the Bible by William Hendriksen (Baker)
41. A Survey of the New Testament by Robert H. Gundry (Zondervan)
42. What the Bible Is All About: NIV Edition by Henrietta C. Mears (Regal)
43. Survey — get a bird's-eye view of the book.
44. Analysis — study everything in each chapter in detail.
45. Synthesis — put it back together again and draw some conclusions.
46. Later you may check yourself and your conclusions against what other reliable scholars have done
47. The Illustrated Guide to Biblical History by Kendall Easley (Broadman & Holman)
48. Nelson's New Testament Survey by Mark Bailey and Tom Constable (Nelson)

49. Nelson's Old Testament Survey by Charles Dyer and Eugene Merrill (Nelson)
50. New Testament Survey by Merrill C. Tenney (Eerdmans)
51. New Testament Times by Merrill C. Tenney (Baker)
52. The Old Testament Speaks by Samuel J. Schultz (HarperSanFrancisco)
53. Old Testament Times by R.K. Harrison (Baker)
54. Old Testament Today by John Walton and Andrew Hill (Zondervan)
55. Survey of the Bible by William Hendriksen (Baker)
56. A Survey of the New Testament by Robert H. Gundry (Zondervan)
57. What the Bible Is All About: NIV Edition by Henrietta C. Mears (Regal)
58. Survey — get a bird's-eye view of the book.
59. Analysis — study everything in each chapter in detail.
60. Synthesis — put it back together again and draw some conclusions.
61. Methodical Bible Study by Robert A. Traina (Zondervan) [Very advanced]
62. The Navigator Bible Studies Handbook (NavPress)
63. The New Joy of Discovery in Bible Study by Oletta Wald (Augsburg Fortress)
64. Personal Bible Study by William Lincoln (Bethany Fellowship)
65. Basic Biblical Interpretation by Roy Zuck (Victor)
66. Basics of Bible Interpretation by Bob Smith (Word Books)
67. Getting the Message by Daniel Doriani (Presbyterian & Reformed)
68. Grasping God's Word by Scott Duvall and Daniel Hays (Zondervan)
69. How to Read the Bible for All Its Worth by Gordon Fee and Douglas Stuart (Zondervan)
70. How to Understand Your Bible by T. Norton Sterrett (InterVarsity Press)
71. Protestant Biblical Interpretation by Bernard Ramm (Baker)
72. Studying, Interpreting, and Applying the Bible by Walter Henry and Gayle Jackson (Zondervan)

Step 2-Choose The Subject or Book of the Bible

1. Choose the subject, person, word, or book of the Bible you want to study, and begin gathering reference materials for your research. The availability of reference tools will largely determine the scope of your study.

Step 3-List Your Reference Tools

1. List all the reference tools you have gathered to do this study (see Tools You Will Need above). This is to help you remember which books were most useful for the background material you researched and what books you may want to refer to in future background studies.

Step 4-Get Insights from Archeology

1. Read Number of books about archeology of the time, also Biblical Archeology.

Step 5-Obtain Insights from Geography

1. You will need to become familiar with the geography of Palestine and the Near East in general. This includes the types of land found there, the major mountains and hills, elevation and rainfall, the major bodies of water (seas, lakes, rivers), location of cities and countries, famous landmarks, and the borders of surrounding countries of the time you are studying.
2. As you study the New Testament, particularly Paul's missionary travels, you will need to become acquainted with the Mediterranean countries and cities that were active during the days of the Roman Empire.
3. In all of your study of biblical geography, you must continually ask this question: "What is the effect of the surrounding geography on what I am studying?"
4. In this step, list all the insights you can get on geography for the subject or book you are studying.

Step 6-Get insights from History

1. You should have a working knowledge of the chronology (order of historical events) of the nation of Israel in the Old Testament. Learn the periods of history of the Hebrew nation; find out the origin and history of famous cities; learn the divisions of Jesus' ministry; be well versed on the history surrounding Paul's missionary travels. It is also helpful to know what major events were going on in other parts of the world during the time you are studying, in order to have a proper perspective on what God was doing in the world.
2. You might ask yourself, "What caused this particular event that I am studying? How did it affect the people involved? How did it affect the passage I am studying?" Be especially aware of events that illustrate God's sovereign control over the progress of history.
3. In this step, list all the insights you can get on history surrounding the subject or book you are studying.

Step 7-Discover Some Insights from Culture

1. If you are to understand what went on in Bible times, you need to learn about the total lifestyle of the ancient people in the Scriptures. Here are some areas you can research while asking yourself, "How do all these things affect the message and the people about whom I am studying?"
 - Types of clothing people wore.
 - Professions and trades in biblical times.
 - Music in the Bible.
 - Architectural styles in the Near East.
 - Manners and customs in Scripture.
 - Recreation in ancient times.
 - Family life in the Middle East.
 - Art in the Bible.
 - Languages and literature of surrounding nations.
 - Religious ceremonies in Israel and among pagan neighbours.
 - False religions of the area.
 - Weapons and tools used by the people.
2. In this step, list all the insights you derive from the way people lived in their cultures.

Step 8-Research Insights from Political environment

1. Much of what happened in Israel in the Old Testament and in the Roman world of Jesus, Paul, and the apostles is related to the political environment of the times.
2. Kings, emperors, rulers, and other powers governed the people of the time. Israel, for example, spent much of its history under foreign rule and even in exile. These other nations and political systems were bound to have an effect on the way God's people lived. Recognize, however, that God is always in control of the political situation. Even King Nebuchadnezzar acknowledged this fact (Dan. 4:34 – 35).
3. Egypt, Philistia, Assyria, Babylon, Persia, Greece, and Rome all played a major part in the Bible. What were these nations like? How did they affect Israel or the New Testament church? Many of the prophets' messages can only be understood in light of their current political climate.
4. In this step, write down all the insights you can from your research into the political conditions of the time period you are studying.

Step 9-Summarise Your Research

1. Now go back over Step Three through Step Six, and from the data you have gathered, summarize your research by answering these two questions:
 - How does this background information help me understand better what I am studying?
 - What influence did any of these factors have on the subject (or book) that I am studying?

Step 10-Read the Book

1. This first step may seem obvious, but some people spend all their time reading about the Bible rather than reading the Scripture text itself. The only tools needed for this first step are your study Bible and several recent translations. Do not read any Bible surveys, handbooks, or commentaries at this point. Follow these seven suggestions:
2. Read through the book at one sitting. Except for the Psalms, the longest book in the Bible is Isaiah, and it can be read in three or four hours. Most of the other books, particularly those in the New Testament, can be read in much less time. If you have to break up your reading, try to finish a book in no more than two sittings. (For example, read Isaiah 1 – 39 at one sitting, then Isaiah 40 – 66.) You will be amazed at what you begin to see in Scripture as you do this.
3. Read through the book in a recent translation. This will enable you to understand what you are reading better, because you will be doing your reading in contemporary language.
4. Read through the book rapidly, ignoring the chapter divisions. Remember that the chapter divisions and verses were not in the original writing; they were added much later for convenience. Right now your purpose is to get the flow of the book and feel the pulse of the writer. Don't be concerned with the details at this stage (you will do that in the Chapter Analysis Method, chapter 10), but read the book quickly to get its main thrust.
5. Read through the book repeatedly. Repeat the process of reading as many times as you can. (Obviously, you will not be able to read the book of Isaiah as many times as the book of Colossians in a given time frame.) Each time you read the book through, you will notice some new things and the overall picture will become clearer and clearer. The more times you read a book through, the better you will be able to understand it. So stay with it.
6. Read through the book without referring to commentaries or someone else's notes. It is good to read in a Bible in which you have not made any notes yourself. Otherwise, when you see the notes you may have written (your own or others'), your mind will naturally fall back into that pattern and you will be hindered from seeing new things. After you have finished Step One, you may begin consulting with reference helps.
7. Read through the book prayerfully. Ask God to speak to your heart and open your eyes that you may see wonderful things in his law (Ps. 119:18).

8. Read through the book with pen or pencil in hand. As you begin reading the second or third time through, begin taking notes and making observations on what you are reading (see Step Two and the Book Survey Form).

Step 11-Make notes on what you Read

1. As you read through the book (see Step One), write down your impressions and the important facts you discover. Make these notes on a separate piece of paper or on the Book Survey Form found at the end of this chapter. Look for the following nine items:
2. Category: Is the book history? Poetry? Prophecy? Law? A biography? A letter?
3. First Impressions: What is the first impression you get from the book? What do you think is the purpose of the writer? What “feel” do you get from reading it?
4. Key Words: What are some of the significant words the writer uses? What words are repeated the most? What word or words is he emphasising?
5. Key Verse: What seems to be the key verse (if any)? What ideas or phrases are repeated that may show his main thought? What is the writer’s key statement?
6. Literary Style: Is the book a narrative? A drama? A personal letter? A discourse? Poetry? A combination of narration and poetry? Does the writer use figurative speech? Is he using a logical argument?
7. Figure of Speech.
 - These are the following books to use for Figure of Speech.
 - I. **Glossary of Literary Terms by M. H. Abrams.**
 - II. **Figures of Speech used in the Bible by E. W. Bullinger.**
 - III. **Figure of Speech and exploration of used of idiomatic phrases in Conversation by Elizabet Jame Holt.**
 - IV. **Figures of Speech by Christina Alm Arvius.**
 - V. **Figures of Speech or Figures of Thought by Ananda Coomaraswamy.**
 - VI. **The Princeton Encyclopaedia of Poetry and Poetics by Roland Greene.**

8. Analysis of Propaganda

- **These are the following books to use for Review and Analysis of Propaganda:**

- I. All Art of Propaganda by George Orwell.**
- II. Computational Propaganda by Samuel Woolley.**
- III. Fake News, Propaganda and plain old lies by Donald Barclay.**
- IV. How Propaganda Works by Jason Stanley.**
- V. Propaganda and Persuasion by Garth Jowett.**
- VI. Media, persuasion and Propaganda by Marshall Soules.**
- VII. Primetime Propaganda by Ben Shapiro.**
- VIII. Propaganda Studies by Jonathan Auerbach.**

9. Emotional Tone: Is the writer angry? Sad? Happy? Worried? Excited? Depressed? Calm? How do you think his hearers must have felt when they received this writing? How does it make you feel?
10. Main Theme(s): What is the main theme? Is there more than one? What is the writer saying? What is his major emphasis?
11. Structure of the Book: Are there obvious divisions of thought in the book? How is the book organised? Around people? Events? Places? Ideas? Time spans?
12. Major People: Who are the principal personalities in the book? Which people are mentioned the most, and what parts do they play in the book?

Step 12-Analysis of Logic.

Step 13-Analysis of Grammar.

Step 14- Analysis of Genre.

- A. Open Figure Of Speech Folder. Use the Following Books for Analysis of Genre :

- Literary Device.
- FIGURES OF SPEECH - Biblical Research Journal.
- Figures of Speech.

Step 15- Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context

Step 16-Initial Survey

1. Read the entire book at one sitting to identify the theme (subject) of the book. Choose a title that summarises the theme. You will use this title on the Book Study Chart. This will also become the title of your outline.
2. Determine the purpose for which the book was written, to whom it was written, and the author.
3. Some books state the name of the author but for the names of others you will need to consult an outside Bible study resource.* Each author had a special reason for writing under the inspiration of the Holy Spirit. This purpose is usually reflected in the content of the book.
4. Determine the geographic setting of the book. This is where the events occurred. Record this on the Book Study Chart.
5. Summarise the basic life and ministry principle in one sentence. This is the basic truth of the book which is applicable to your life or ministry. There are many principles taught in a single book, but try to determine the most important for this summary statement. Remember, the chapter divisions in the Bible are not divinely inspired. They were made by man for ease in locating specific passages in the Bible. When you read the entire book without chapter divisions you are reviewing the message as it was originally given.
6. In this first reading do not be concerned with details. Survey the book for general information: Theme, author, purpose, to whom, geographic setting, and basic life and ministry principle. Read quickly to gain an overview of the entire book. Do not stop and analyze what you are reading. You will do that later.

Step 17-Book Study Chart

1. Read the book a second time. Note the major divisions of the book. These divisions may be determined by subject matter, events, biographical material, geographical settings, or other such factors.
2. Create titles for each chapter of the book. The chapter title should reflect the general content of a chapter but it should not be so general that it could fit any chapter of the Bible. Think of titles as handles with which to grasp the content of the chapter. Keep them short so they are easy to remember. Enter these chapter titles on the Book Study Chart.

3. Select the key verse of the book. The key verse should be one that best summarizes the purpose or content of the book. Enter the reference on the Book Study Chart. As you read, list the names of major characters in the space provided on the chart. This list will provide a selection from which to do biographical studies. You will learn how to do such studies later in this course.
4. Record key words and phrases on the chart. Key words and phrases are those basic to understanding the book. They are often repeated frequently or explained in detail in the book. You can use this list for word studies which you will learn how to do later in this course.

Step 18-Do Background Study

1. Find out the historical and geographical setting of the book. Into what background does the book fit? You can use the following questions to help you find some of the facts. Also use the ideas presented in the Book Background Method of Bible.
2. Study (chapter 8). Many of the answers may be found right in the book itself, so look there first. If you can't find the answers in the text alone, then check outside references (see Tools You Will Need earlier in this chapter).
 - What can I learn about the writer(s)?
 - When was the book written? (Date).
 - Where was the book written?
 - To whom was the book written? Who were they? Who was he? Who was she? (Find out about their historical and geographical backgrounds.).
 - Why was the book written? (Investigate the circumstances related to the writing.).
 - What other background information sheds light on this book?
 - What is the place of this book in the Bible? Is it a bridge between various periods of history?
 - What are the geographic locations mentioned in the book? Where are they? (Draw a map if it will be helpful to you.)

Step 19-Make Horizontal chart of the Book's Content

1. One of the exciting steps in doing a book survey is making a horizontal chart. This is a diagramed layout of a book's contents on one or two sheets of paper. The value of such a chart is that it enables you to lay out visually the book's contents and divisions. It gives you a new perspective of the book. The three parts to a simple horizontal chart are the major divisions of the book, chapter titles, and paragraph titles. Why make a horizontal chart? You gain several benefits in this study by making one.
 - It helps you summarise the main ideas and contents of a book.
 - It enables you to see the contents of an entire book at a glance.
 - It helps you discover the relationships between chapters and between paragraphs.
 - It makes you aware of ideas repeated in several places in the book.
 - It serves as a memory device to help you recall a chapter's content quickly.
 - It enables you to think through a book and remember it. Preparation for making a horizontal chart. You need three tools to make a simple horizontal chart:
 - A Bible with paragraph divisions. Many recent versions have divided the text into paragraphs to enable you to see the units of thought. You have to know these in order to make the chart.
 - A pencil (or pen) and a ruler.
 - A blank sheet of paper, preferably 8 x 11 in size. Try to fit your chart on one sheet of paper so you can see the entire structure of the book at a glance. When you are working on a long book (e.g., Isaiah, Genesis, Psalms), try to use as few sheets as possible. In using more than one sheet, be sure to use the same scale so you can match the sheets. How to make a horizontal chart. Go through the following four steps for each chart you make.
2. On a blank sheet of paper, make as many vertical columns as there are chapters in the book. For longer books, make the columns narrower and abbreviate what you write in them and use two or three sheets of paper as needed.
3. Read through the book again and find its major divisions. Record these divisions in as few words as possible at the top of your chart (see the Sample Filled-out Form).

4. Read through the book again and think of a title for each chapter (or group of chapters in a longer book). Record these at the top of each column directly below the major divisions. Irving Jensen has suggested five characteristics of good chapter titles (Independent Bible Study, Moody Press, p. 108).
 - Preferably use one word, not more than four.
 - Use picturesque words that help you visualise the contents.
 - Use words taken directly from the text if possible.
 - Use words that have not been used previously as chapter titles in your study of other books.
 - Use words that tell you where you are in the book.
5. Read through the book once more and do the same thing to all the paragraphs in your book. Try to relate the paragraph titles to the chapter title under which they fall. As you become proficient in this exercise, you may add things to your charts that personalise your study.

Step 20-Make Tentative Outline of Book

1. After you have summarized the contents of the book on a horizontal chart, you are ready to make a simple tentative outline of the book. Later on, in the Book Synthesis Method of Bible Study (chap. 11), you will make your final, detailed outline of the book. In the current method you should merely outline the high points of the book and show their relationship with one another. Here are some suggestions:
 2. Refer to your horizontal chart for ideas in outlining. Often your chart will readily show the natural organisation of the book's contents.
 3. Outline from the major to the minor. Look for major divisions of the book first, then the subdivisions (which could be the chapters themselves), and finally the important points that fall under the subdivisions (which could be the paragraphs). In longer books you may need to have further subpoints under these.
 4. Watch your paragraph divisions for clues in outlining. Since the paragraphs the basic unit of thought in writing, you can use the paragraph divisions as a guide in designing the outline of the chapter. Write a summary statement for each paragraph, then use those statements as the major points of your outline.
1. After you have done your own outlining, compare yours with as many other outlines as you can. Check the reference books available to you and compare your work with those writers. Don't be concerned if your outline does not match these exactly, for often there are many ways to outline a book. You will discover that even notable scholars disagree with each other.

Step 21-Select Chapter Title

1. Record on the Chapter Study Chart the name of the book and chapter number you are studying. Read the entire chapter and give it a title which reflects its content. (If you have done a book survey, you will have already selected a chapter title. Chapter Eleven on book study explains how to select chapter titles).

Step 22-Mark Paragraph Divisions

1. Mark the paragraph divisions within the chapter. In some Bibles the paragraphs are marked with a special paragraph mark (¶). In other Bibles they are marked with a boldface verse number. (Boldface means that the number is darker than the numbers in front of other verses.) If your Bible has neither paragraph marks or boldface markings then you must determine the paragraph divisions yourself. To do this you must know the definition of a paragraph: "A paragraph is a group of verses which relate to the same subject matter. When the subject changes, then a new paragraph has begun."
2. Mark the paragraph divisions in your Bible by drawing a circle around the verse number where each paragraph begins.

Step 23-Create Chapter Study Chart

1. On the Chapter Study Chart record the title of the chapter. List the verses of the paragraph divisions (see example). Then give each paragraph a title which reflects the content of that paragraph. Use the column with the heading "Notes" to record your thoughts about the relation between parts of the chapter (see example). These notes will assist you in creating the chapter outline.

Step 24-Write out Chapter Summary

1. You begin this step by reading and rereading the chapter many times. All you are doing here is making general observations on the chapter as a whole. After you have read it through several times, describe the general contents in one of the ways about to be described. Do not try to interpret what you see at this time, but merely aim to become familiar with the chapter. You may summarize it in one of the following ways:
2. Paraphrase it. The simplest way is just to rephrase the chapter in your own words. Summarize it in such a way that you could read your paraphrase to

another person. You can check some recent paraphrase versions of the Bible for examples of this.

3. Outline it. Another simple way to summarize is through an outline that follows the paragraph divisions of the chapter. Give a title to each paragraph, then place some subpoints under each one.
4. Rewrite it without the modifying clauses and phrases. Use just the subjects, verbs, and objects in your summary. This is a great way to summarize some of Paul's writings, for example, where run-on sentences (especially in the King James Version) are hard to understand because of their complexity. After you have completed your chapter summary, give a title to the chapter, using either your title from the book survey or a new one that occurred to you during this study.

Step 25-List Your Observations

1. This step begins the verse-by-verse analysis of the chapter. You start with the activity of observation. In this step you are looking in detail at every sentence and word and then writing down everything you see. You are trying to answer the question, "What does it say?" Before you can begin to interpret the meaning of a verse or passage, you must first look at what it actually says. The purpose of observation is to saturate yourself completely with the contents of a Bible passage. The mark of good Bible students is that they have trained themselves to observe things in the text that others overlook.
2. Overlooking biblical facts — reasons why. There are three reasons why we often overlook things and miss so much in the biblical text: (1) We rush through a passage too quickly. So we need to slow down and not indulge in speed-reading.
3. (2) We don't write down our observations. Louis Agassiz, a 19th-century professor of zoology at Harvard who taught his students the art of observation, used to say, "A pencil is the best eye." We need to write down what we see, and then we will begin seeing more. (3) We give up too soon. The longer we squeeze a lemon, the more juice we get out of it — to a point. But unlike lemons, the Bible never goes dry. We can study a text a hundred times and never exhaust the riches that are in it. So we shouldn't give up too soon; rather, we should keep on looking — the longer the better.

4. Asking questions. As has already been discussed, the secret of good Bible study is learning to ask the right questions (see the Introduction at the beginning of this book). The number of questions you can ask of a text of Scripture increases in proportion to your willingness to stick with it. As you continue growing in Bible study skills, the type and number of questions you ask will improve and you will be able to observe more and more. The key to good observations, then, is a combination of diligence, patience, asking many questions, and writing down everything you see.
5. To help you in your observations, appendix F lists 30 ideas from which you can select the ones that will suit your study.

Step 26-Ask Interpretation Questions

1. After observing all you can in the passage under study, you are ready to move on to interpretation. This step involves asking questions about meaning, then trying to find answers to them. In this exercise you discover the biblical writer's purpose and message by uncovering what he means by his idea. Interpretive questions include asking what or why. Some examples:
 - Why did the writer say this?
 - What is the meaning of?
 - What is the significance of?
 - What is the implication of?
 - Why is this important?
2. You should be able to think of many other interpretive questions to ask. Never think that any question is too silly or dumb. Always write every question down on your form even though you may not find an answer to it. Later on, in studying another chapter, you may be able to answer it; if so, come back to this chapter's form and fill in the answer. Remember that the more questions you ask, the more you will draw out of the text.
3. Listing difficulties. When you are writing down your questions, it is a good idea to include any difficulties you have in understanding what is being said. Two common types are personal difficulties — questions you would like answered in the future, or items for future study, and possible difficulties — matters that don't bother you at this time, but would be good to study so you can help others who might be bothered by them.

4. Finding the right meaning of the text. After you have listed all your questions of interpretation, you need to start finding some answers. There are several ways to do this.
5. Check the context. You should always start here, for often the answers to your questions will be found in the verses preceding or following the text. Always interpret a passage in light of its context. To review the context, you may have to go back to your observations or your book survey to answer these questions:
 - Who is speaking?
 - Who is being spoken to?
 - When is it being spoken?
 - Where is it being spoken?
 - What is the occasion or circumstance?
 - What is the main subject of the message?
 - Is the aim of what is being said revealed?
 - What other background material clarifies this statement?
6. You can avoid a great deal of misinterpretation by first checking out the context of a verse.
7. Define the words and phrases used. You must interpret your text according to the correct and proper meaning of the words. Look up the important words in a Bible dictionary, word study set, or English dictionary.
8. Study the grammar and structure of the sentences. Sometimes a problem of interpretation can be cleared up by diagramming a sentence or by understanding what grammatical usage the writer intended in the paragraph. Compare several translations of the text. Use different recent versions of the Bible to see how the various translators rendered a particular word, phrase, or paragraph.
9. Study the background of the text. Interpret your text in light of the historical, cultural, geographic, economic, social, and political backgrounds of the book, including the current events of that time. This shows you the value of doing a book survey study before attempting a chapter analysis study. Use your reference tools to check on the background, the writer's purpose in writing the book, and other pertinent factors.

10. Compare your text with other passages of Scripture. This next step — correlation— will give you some answers to interpretive questions as you compare Scripture with Scripture.
11. Consult a commentary as a last resort. If you have tried diligently to find the meaning of the text yourself and your cross-references have not helped you, consult the works of great Bible scholars. There is a place for commentaries in Bible study, but it comes only after you have done your own work. Compare your interpretation with the writings of devout Christians and see if yours agrees with theirs. If you have a correct interpretation, you may be sure God has shown it to some other sincere Bible students in the past. If you can't find anyone who agrees with you, you have probably got a wrong interpretation.
12. Ask the six vital observation questions: What? Why? When? How? Where? Who?
13. Look for key words.
14. Look for repeated words and phrases.
15. Look for questions being asked.
16. Look for answers being given.
17. Look for commands.
18. Look for warnings.
19. Look for comparisons — things that are alike.
20. Look for contrasts — things that are different.
21. Look for illustrations.
22. Look for causes and effects and reasons for doing things.
23. Look for promises and their conditions for fulfilment.
24. Look for progression from the general to the specific.
25. Look for progression from the specific to the general.
26. Look for steps of progression in a narrative or biography.
27. Look for lists of things.
28. Look for results.
29. Look for advice, admonitions, and attitudes.
30. Look for the tone of the passage — emotional atmosphere.
31. Look for connectives, articles, and prepositions.
32. Look for explanations.
33. Look for Old Testament quotes in the New Testament.
34. Look for the literary form.

35. Look for paradoxes.
36. Look for emphasis through the use of space — proportion.
37. Look for planned exaggerations or hyperboles.
38. Look at the grammatical construction of each sentence.
39. Look for the use of the current events of the times.
40. Look for the force of the verbs.
41. Look for anything unusual or unexpected.

Step 27-Correlate Your Chapter with Other Scriptures

1. This step involves finding cross-references for the verses of your chapter in order to further explain the meaning of the text. It is based on the principle of interpretation that says, “The Bible interprets itself; Scripture best explains Scripture.” You can often interpret passages that are not clear by passages that are. Ask yourself, “How do other Scriptures relate to and explain this one?” Steps in cross-referencing. Here are some practical ways to correlate verses:
2. First, look for cross-references within the same book you are studying. This is internal correlation.
3. Second, compare statements in other writings by the same author. This is external correlation.
4. Then, compare with other books in the same testament.
5. Finally, compare references in all of Scripture. You can find cross-references in a study Bible or reference Bible or by looking up similar words in a concordance. Types of cross-references. There are several different types of cross-references, including the following:
 - The pure cross-reference. This is sometimes called the parallel cross reference because it says almost exactly the same thing as the verse you are analyzing.
 - The illustrative cross-reference. This type, which may involve a real event or person in history, illustrates what the verse you are studying is saying.
 - The contrasting cross-reference. This type says the opposite of what your verse says. It may look like a contradiction, but it is actually approaching the subject from a different viewpoint. One word of caution: Be sure to check the context of the verses you choose as cross-

references. Otherwise you may be making them say what the writer did not say.

Step 28-List Some Possible Applications

1. The last part of the verse-by-verse analysis is to write down some possible applications. Remember that your goal in Bible study is not just interpretation but application. Because of the many applications a chapter may have, you will only be listing them here. Later on, in Step Seven, you will choose one of these to write out and to work on for a week. You have already seen that you cannot work on more than one application per week. It is better to record just one and fully apply that truth to your life than to write down several applications and then fail to implement any of them.

Step 29-Write Down Some Concluding Thoughts

1. Go back over the results of the first five steps, review them carefully, and write down some concluding thoughts on the chapter. These can include additional observations, some of your interpretations, themes you have discovered, possible topics and people you want to study in the future, words you may want to do a word study on, and any number of other thoughts that come to mind.

Step 30-Observe the Details

1. The paragraphs in a chapter can relate to each other in different ways. Here are some special things to observe as you study paragraphs:
2. Connectives: Words called "connectives" are very important. They reveal relationships within and between paragraphs. The word "but" is a connective and introduces a contrast. For example: But these speak evil of those things which they know not; But what they know naturally, as brute beasts, in those things they corrupt themselves. (Jude 1:10).
3. There is a contrast in this paragraph. False teachers speak evil of things they do not know BUT they also corrupt the things they do know. The verse begins with the word "but" which should make you look back to verse 9 to see what the contrast is: Yet Michael the archangel, when contending with the devil he disputed about the body of Moses, durst not bring against him a railing accusation, but said, The Lord rebuke thee. (Jude 1:9) Verse 10 contrasts false teachers who speak evil of dignities with the archangel Michael. Even though he held a great position, he did not accuse the devil but said "The Lord rebuke thee." The connective word "or" indicates a contrast. For example: For God shall bring every work into judgment, with every secret thing, whether it be good OR whether it be evil. (Ecclesiastes 12:14) Other connective words to watch for are "like" and "as." Instead of a contrast these words show comparisons between things. For example in the following verse Satan is compared to a lion: . . . the Devil AS a roaring lion, walketh about, seeking whom he may devour. (I Peter 5:8) The word "and" is another connective. It adds to what has just been stated: Like wise also these filthy dreamers defile the flesh, despise dominion, AND speak evil of dignities. (Jude 1:8) The word "if" introduces a conditional statement. Many of the promises and prophecies of the Old Testament are stated this way. They tell what God will do IF (on the condition that) His people make a certain response: IF my people, which are called by my name, shall humble themselves, and pray, and seek my face, and turn from their wicked ways, then will I hear from Heaven and will forgive their sin, and will heal their land. (II Chronicles 7:14) The word "that" sets forth a purpose. It tells that something happened "in order that" a certain purpose would be accomplished: And He came and dwelleth in a city called Nazareth; THAT it might be fulfilled which was spoken by the prophets, He shall be called a Nazarene. (Matthew 2:23) Watch also for the connecting words "for,

because, therefore." These words introduce reasons and results: But when He saw the multitudes, He was moved with compassion on them, BECAUSE they fainted, and were scattered abroad, as sheep having no shepherd. (Matthew 9:36) The words "in, into, and with" are also important connectives. They also indicate relationships between concepts: He turned the sea INTO dry land and they went through the flood on foot: there did we rejoice in Him. (Psalm 66:6).

4. General Structure: As you study paragraphs observe the arrangement of ideas and how the verses relate to each other. Sometimes the author makes a general statement, then explains it with examples. Other times he lists a series of ideas and then summarizes with a general statement. In the example given later in this chapter, you will note that Jude wrote several paragraphs listing characteristics of false teachers. He then gave Old Testament examples which illustrated what he was teaching.
5. Repetitions: Each word of the Bible is inspired by the Holy Spirit. When words or phrases are repeated it is because they are especially important. The Holy Spirit inspired the writers to repeat words and phrases in order to fix them in your memory. The words "verily, verily" are an example of this. When Jesus preceded a statement with these words it was like an announcer saying "May I have your attention please. I have an important announcement to make." Study in detail any words, phrases, or verses that are repeated.
6. Questions And Answers: It is also important to observe the questions and answers of the Bible. Often an author will introduce a subject by asking a question. He will then explain this question and give answers which relate back to the question. A good example of this is Romans 6. Read the entire chapter. Note the questions in verses 1-3 and the answers developed throughout the chapter.
7. Introductions: Watch for paragraphs that introduce the subject that is to follow. For example, in the book of Jude which you studied in the last chapter verse 3 introduces the material to follow: Beloved, when I gave all diligence to write unto you of the common salvation, it was needful for me to write unto you, and exhort you, that ye should earnestly contend for the faith which was once delivered unto the saints. (Jude 1:3) This introductory paragraph explains the purpose of his writing. He is exhorting them to earnestly contend for the true faith. The remainder of the chapter gives reasons for this exhortation. There

are false teachers creeping into the church who are trying to turn them from the true faith.

8. **Summaries And Conclusions:** Be alert for paragraphs that summarize an entire passage, chapter, or even a book. For example, the book of Ecclesiastes contains one verse which summarizes the whole book. In Ecclesiastes the writer has described his quest for life apart from God. His final conclusion is: Let us hear the conclusion of the whole matter: Fear God, and keep His commandments: for this is the whole duty of man. For God shall bring every work into judgment, with every secret thing, whether it be good, or whether it be evil. (Ecclesiastes 12:13-14).
9. **Progressions In Thought:** When studying paragraphs, watch for progressions in thought. Note the following paragraph: And beside this, giving all diligence, add to your faith virtue; and to virtue knowledge; And to knowledge temperance; and to temperance patience; and to patience godliness; And to godliness brotherly kindness; and to brotherly kindness charity. For if these things be in you and abound, they make you that ye shall neither be barren or unfruitful in the knowledge of our Lord Jesus Christ. But he that lacketh these things is blind, and cannot see afar off, and hath forgotten that he was purged from his old sins. (II Peter 1:5-9) There is definite progression in this passage. We are to add one thing to another until we become fruitful.
10. **Literary Form:** Literary form refers to how a passage is written. Some passages are in narrative or story form. This means they read like a story. Other paragraphs are in poetic form (poems) like the passages in the book of Psalms. Some paragraphs are parables which are short stories illustrating a spiritual truth. Some paragraphs are in dramatic form. For example, the Song of Solomon contains dramatic as well as poetic form. Discourse form is much like a sermon. It is a series of paragraphs giving instruction on a certain subject.
11. **Key Words:** Identifying key words will help you understand the meaning of a paragraph. Key words are those important to the meaning of a paragraph. Often they are words which are repeated. Especially note key words which you do not understand. These words can be studied in a word study. (You will learn how to do this later in this course). For example, read the following verse: For there are certain men crept in unawares, who were before of old ordained to this condemnation, ungodly men, turning the grace of our God into

lasciviousness, and denying the only Lord God and our Lord Jesus Christ. (Jude 1:4) Do you know what the word "lasciviousness" means? It is an important word in this paragraph because it describes false teachers. One of their characteristics is that they have turned the grace of God into lasciviousness. This word is an example of a key word to study.

12. Grammatical Construction: The word "grammar" refers to parts of speech or words that fit together to make up sentences and paragraphs. Watch for words which are called verbs. These are words that show action telling what someone did in the past, is doing in the present, or will do in the future. They also are used in commands: GO ye into all the world and PREACH the Gospel to every creature. (Mark 16:15) The words "go" and "preach" are action words. They are verbs. They are commands for us to obey. A noun is a word that names a person, place, or thing. The words in capitals below are nouns: JUDE, the servant of JESUS CHRIST, and brother of JAMES... (Jude 1:1) Nouns tell who and what is involved and where the action took place. A pronoun is a word that replaces or stands for a noun. The words "him" and "her" are examples. Instead of saying "The Holy Spirit inspired Jude to write the book" you could say "The Holy Spirit inspired HIM to write the book." The word "him" is a pronoun standing for the noun Jude.

13. Adjectives and adverbs are important parts of speech also. Adverbs tell something about a verb. It tells how something happened. For example, in the sentence "He ran quickly," the word "quickly" is an adverb because it tells how he ran. An adjective describes a noun or pronoun. If we said "Jude was tall," the word "tall" is an adjective which describes Jude. If you have not studied parts of speech before this may seem confusing at first, but you will soon learn to identify these as you practice. Parts of speech are important because they identify people, places, and things. They tell who did something, where, when, and why. They tell how things were done and what was, is, or will be done. They also provide descriptions and details which increase understanding of the subject matter.

Step 31 Create Paragraph Study Chart

1. By studying paragraphs in detail as described in Step Two, you will identify certain paragraphs that relate to each other. Their relationship may be contrasts, comparisons, progressions, or otherwise. Select these for paragraph study. You will create a chart to summarise your study of these paragraphs. Select a general title for your chart which reflects the relationship of the paragraphs or the subject which they concern. The chart will also include the paragraph titles and divisions made during the chapter study.
2. Record on the chart the book, chapter, and paragraphs studied. Use margins of the chart to make observations and applications.

Step 32 Create Paragraph Outline

1. Use the chart to help you create an outline of the paragraphs. The outlines you create on chapters and paragraphs will help you as you share God's truth with others because they help you present what you have learned in an orderly way.

Step 33-Write Out a Personal Paraphrase

1. Write out the verse in your own words. Do not use one of the modern paraphrases except to get the idea of how to do it. Stay true to the verse you are paraphrasing, and try to condense rather than expand it.

Step 34-List some Questions, Answers and Observations

1. In column 3 of the Chapter Analysis Form at the end of this chapter, list any questions you have relating to words, phrases, persons, topics, and doctrines in that verse. Write down any answers you can find and also record any observations you have. Mark these as follows:
 - Q = Question.
 - A = Answer.
 - O = Observations.

Step 35-Find Some Cross References for Each Verse

1. Using the cross-references from your study Bible or from Scripture memory, write down some cross-references (at least one) for the verse you are studying. Identify the word or phrase you are cross-referencing at the end of this chapter. Use a concordance if you do not have a cross-referenced Bible.

Step 36-Record any insights you get from each verse

1. Having thought through the words, phrases, and concepts in the verse, record any insights that you get from them. These could be further observations, words and names that you have looked up and defined, or any other thought that comes to you. Let your imagination go and be as creative as you can in this fifth column, called Personal Application, in the form at the end of this chapter.

Step 37-Write down a brief personal application for each verse

1. Because of the number of verses in your study, you will not be able to design an application project for each verse. Instead, just try to record some devotional thoughts that come to you from each verse. Later, in a devotional Bible study, you can pick one of the thoughts and plan to work on it. Or, if a particular verse seems to meet an immediate need, go ahead and write out an application that is possible, practical, personal, and measurable.

Step 38-Reread the Book

1. Reread the book several times. Read it at one sitting, in a recent translation, rapidly, repeatedly, prayerfully, without referring to commentaries, and with pen or pencil in hand.

Step 39-Write Out a detailed, final outline

1. Compare the horizontal chart and tentative outline you created in your book survey with the passage summaries you created in your chapter analysis studies. Based on this comparison and your recent readings, write out a detailed, final outline of the book. Merrill Tenney gives an excellent example in his book on Bible study methods.

Step 40-Write down a descriptive Book Title

1. From your horizontal chart in the book survey and your detailed, final outline in Step Two, write down a descriptive title for the book you have just studied. Think up an original title that describes in a few words what the book is all about. You might also consult your chapter titles and form a synthesis of them.

Step 41-Make summary of your insights

1. Review and compare the concluding thoughts in each of your chapter analysis studies and summarise what you believe are the major themes and conclusions of the book. Do not refer to commentaries at this point, for these should be your own insights into God's Word. These insights could also include observations gained from your new readings.

Step 42-What Further Analysis or Research I Need To Do, Next Time?

Method 18-How To Understand and Apply

HERMENEUTICS

Step 1. Open Hermeneutic Folder. Decide, Which Of the Following Hermeneutics Books I will Use For Analysis Biblical Text.

- Listen, Follow and Apply Every Step of the Book How To Understand and Apply The New Testament By Andrew David Naselli.
- Listen, Follow and Apply Every Step of BIBLICAL HERMENEUTICS By Milton Terry.
- Listen, Follow and Apply Every Step of Introduction To Biblical Interpretation by William W Klein.
- Listen, Follow and Apply Every Step of Introduction To Biblical Hermeneutics by Walter C Kaiser Jr.

Step 2. Follow Each Step of the Book.

Step 3-Analysis of Logic.

Step 4-Analysis of Grammar.

Step 5- Discourse Analysis of The Text

A. Use the Following Books for Discourse Analysis:

- Critical Discourse Analysis_ The Critical Study of Language.
- Discourse analysis.
- The Routledge handbook of discourse analysis.

Step 6- Analysis of Genre.

A. Open Figure Of Speech Folder. Use the Following Books for Analysis of Genre :

- Literary Device.
- FIGURES OF SPEECH - Biblical Research Journal.
- Figures of Speech.

Step 7- Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context

Step 8- Facts within The Context.

Step 9- Do the Fact Checking. Checking Facts, If they are correct or incorrect.

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Research the Facts, figures and ideas and do fact checking, if these are true or false through:
- Wikipedia
 - E-book
 - Books about autobiography and Biography
 - Websites
 - University
 - Books
 - Audiobooks
 - Handbooks
 - Dictionary
 - Cross References
 - Atlas
 - Commentaries
 - Articles
 - Journals
 - Newspapers
 - Websites

C. Do full fact checking of the facts the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

D. Do full fact checking of the figures the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

E. Do full fact checking of the statistics the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

F. Do full fact checking of the formulas the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

G. Do full fact checking of the mathematical results the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

H. Do full fact checking of the evidences the author provided.

- Are The Facts Provided are Trustworthy?

- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?
- I. Any other information author provided do full fact checking.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

Step 10-Rhetorical Analysis Of The Text

- A. Open Rhetorical Analysis Folder. Use The Following Books For Rhetorical Analysis of The Book:
 - Rhetoric By Aristotle.
 - A Companion to Rhetoric and Rhetorical Criticism.
 - Ancient Rhetoric From Aristotle to Philostratus.
 - Ancient Rhetoric For Contemporary Students by Sharon Crowley.
 - Art Of Rhetoric By Aristotle.
 - Conversations In American Literature: Language, Rhetoric, Culture By Robin Aufses.
 - Encyclopaedia of Rhetoric.
 - On Rhetoric: Theory of Civic Discourse by Aristotle.
 - Politics and Rhetoric: The Persuasive Power of Metaphor.
 - Rhetoric By Jennifer Richards.
 - Rhetoric In Details By John Benjamins.
 - Rhetorical Grammar By Martha Kolln.
 - Sourcebook on Rhetoric By James Jasinski.
 - The Language of Composition: Reading, Writing, Rhetoric by Renee Shea.
 - The Longman Writer_ Rhetoric, Reader, Research Guide, and Handbook.
 - The Rhetoric of Reason By James Crosswhite.
 - Trivium- Liberal Arts of Logic, Grammar and Rhetoric By Sister Mirriam Joseph.
 - Writing Arguments: a RHETORIC With Reading by John Ramage.
- B. Follow Every step of the Book, I have chose to do Rhetorical Analysis.

Method 19 - Theological Group of Principles.

Step 1. Decide, Which Of the Following Theological Group of Principle or Sub-divided Context Mention Principles:

Theological Group of Principles:

1. The **Historical-grammatical** principle based on historical, socio-political, geographical, cultural and linguistic / grammatical context
2. Alternate, mutually exclusive, models of history:
 - A. The **Dispensational model** or The **Chronometrical Principle**: "During different periods of time, God has chosen to deal in a particular way with man in respect to sin and man's responsibility."
 - B. The **Covenantal model**: "We differentiate between the various contracts that God has made with his people; specifically their provisions, their parties and their purposes."
 - C. The **New-Covenantal** model: The Old Testament Laws have been fulfilled and abrogated or cancelled with Christ's death, and replaced with the Law of Christ of the New Covenant, although many of the Old Covenant laws are reinstitute under the New Covenant.
3. The **Ethnic Division Principle**: "The word of truth is rightly divided in relation to the three classes which it treats, i.e. Jews, **Gentiles** and the Church."
4. The **Breach Principle**: Interpretation of a certain verse or passage in Scripture is aided by a consideration of certain breaches, either breaches of promise or breaches of time.
5. The **Christo-Centric Principle**: "The mind of deity is eternally centered in Christ. All angelic thought and ministry are centered in Christ. All Satanic hatred and subtlety are centered at Christ. All human hopes are, and human occupations should be, centered in Christ. The whole material universe in creation is centered in Christ. The entire written word is centered in Christ."

6. The Moral Principle

7. The **Discriminational Principle**: "We should divide the word of truth so as to make a distinction where God makes a difference."

8. The Predictive Principle

9. The **Application Principle**: "An application of truth may be made only after the correct interpretation has been made"

10. The Principle of Human Willingness in Illumination

11. The **Context Principle**: "God gives light upon a subject through either near or remote passages bearing upon the same subject."

Sub-divided Context/Mention Principles:

1. The **First Mention Principle**: "God indicates in the first mention of a subject the truth with which that subject stands connected in the mind of God."

2. The **Progressive Mention Principle**: "God makes the revelation of any given truth increasingly clear as the word proceeds to its consummation."

3. The Comparative Mention Principle

4. The **Full Mention Principle** or The **Complete Mention Principle**: "God declares his full mind upon any subject vital to our spiritual life."

5. The **Agreement Principle**: "The truthfulness and faithfulness of God become the guarantee that he will not set forth any passage in his word that contradicts any other passage."

6. The **Direct Statement Principle**: "God says what he means and means what he says."

7. The **Gap Principle**: "God, in the Jewish Scriptures, ignores certain periods of time, leaping over them without comment."

8. The **Threefold Principle**: "The word of God sets forth the truths of salvation in a three-fold way: past - justification; present - sanctification/transformation; future - glorification/consummation."

9. The **Repetition Principle**: "God repeats some truth or subject already given, generally with the addition of details not before given."

10. The Synthetic Principle

11. The Principle of Illustrative Mention

12. The Double Reference Principle

Step 2. Decide the List of References of The Bible Text which would be appropriate For Analysis Specific Theological Group of Principle or Sub-divided Context Mention Principles

Step 3-Analysis of Logic.

Step 4-Analysis of Grammar.

Step 5- Analysis of Genre.

Step 6- Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?

Step 7-What Are The Facts Within Context?

Step 8-Implication.

- What are implication of this?

Step 9-What Further Analysis or Research I Need To Do, Next Time?

Step 10-Write out a Personal Application.

1. Application is when you personally apply to your life and ministry the truths you have learned.
2. Example to Follow.
3. Error to Avoid.
4. Duty to Perform.
5. Promise to claim.
6. Relationship to develop.
7. Changes to make.
8. Prayer to pray.
9. Did I see anything of myself in this person's life?
10. Did he show some of my weaknesses?
11. Did he reveal to me some of my strengths?
12. What impressed me most about this person's life?
13. Where do I fall short in this area?
14. What do I intend to do about it?
15. What were the positive character traits? Ask God to help you develop them in your own life.
16. What were the negative character traits? Do you see any of these in your own life? Ask God to help you overcome them.

17. Compose one sentence which summarizes the greatest truth you learned from this life. For example, a statement about the life of Sampson might be "Spiritual compromise results in failure."

Step 11-Meditate on Verse you have chosen to study

1. Meditate means think and dwell and ponder.
2. Select a bible portion to study, identify its subject and key verse and summarise its teaching, then meditate on passage.
3. Recall passage which is the most important in the portion of the text.

Method 20-How To Read A Book, Compact Literature and Literature of Composition

Step 1. Decide, Which Of the Following How To Read A Book By Mortimer Adler Editions and Compact of Literature and Literature of Composition I will Use For Analysis, Reading, Syntopicon, Research and Investigation and Investigative Journalism.

- **How To Read A Book: The Classical Guide To Intelligent Reading by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book: Revised and Updated by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book: The Art Of Getting A Liberal Education 1940 Edition by Mortimer Adler**
- **How To Read A Book: The Art Of Getting A Liberal Education 1972 Edition by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book:A Guide To Reading The Great Books 1966 Edition by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book: The Classical Guide To Intelligent Reading 1972 Edition by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book1972 Edition by Mortimer Adler and Charles Van Doren.**
- **Compact of Literature.**
- **Literature of Composition.**

Step 2. Listen How to Read A Book or Compact of Literature and Literature of Composition of Your Choice, then follow and apply each Steps in Reading the Book or Text You are Analysing.

*Step 32 - Decide The Rules of Reading For
More In-depth Analysis, Syntopicon,
Research, Investigative Journalism or Mixed
Method. Use These Methods To Do Very
DEEP Analysis of the Text or Topic
Than Previous Methods.*

1. Decide The Rules of Reading For Deep Work, Shallow Work, Bible Study, Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method.

A. Practical-Mortimer Adler book how to read a book type of process

I. Method 21-How To Read A Book By Mortimer Adler Various Editions.

II. Method 22-How To Read A Book For Various Books.

- First Level of Reading
- Second Level Reading
- Third Level of Reading
- Aids to Reading
- How To Read Practical and Theoretical Books
- How To Read Imaginative Literature
- Reading Stories
- Reading Plays
- Reading Poems and Poetry
- How To Read History
- How To Read Biography

- How To Read Autobiography
- How To Read About Current Events
- How To Read Science and Mathematics
- How To Read Philosophy
- How To Read Theology
- How To Read Social Science
- Fourth Level of Reading: Syntopical Reading

B. For Syntopicon, Research- Advanced

- I. Method 23- Syntopicon.
- II. Method 24-The Craft of Research
- III. Method 25-Research Books can Be Used.

C. For Investigative Journalism- Advanced

- I. Method 26-Journalism: New Challenges

D. Mixed Method- Advanced

- I. Method 27-Mixed Methods of Rules of Reading

Step 33-How Many Pages Read A Day.

1. Step 1-How Many Pages Read A Day.

- I. Read no more than 2-25 pages a day, and do The Work Required to Have an Opinion on Any Topic and Anything.
- II. The ideal is not merely to read or Listen faster, but to read or Listen at different speeds, and to know when the different speeds are appropriate.

Step 34 - Do Not Speed Read.

1. Do Not Speed Read.

- I. **Don't fool yourself.** While reading is the key to getting smarter, speed reading is just a fancy way of fooling yourself into thinking you're learning something. In reality Speed reading is just turning pages quickly.
- II. **Reading fast is not thinking.** If you're reading fast you're not thinking and challenging what you're reading. You're not being critical. You're not making connections with existing knowledge. You're not arguing with the author. You're not reading something at the edge of your cognitive ability. All of that is work. And if you're not doing the work, you're only walking away with surface knowledge. Reading is mentally demanding.
- III. **Reading fast is worse than not reading.** Reading fast gives you two things that should never mix: surface knowledge and overconfidence. And that's a recipe for really bad decisions. Bad decisions reduce the free time we have. After all, we have to run around fixing all of these mistakes.
- IV. **Visible costs get attention, invisible ones don't.** Most people choose the path of low upfront visible costs and high visible costs later. If you're willing to incur the cost of reading correctly and appropriately (it takes more time than speed reading), you get a massive benefit later. If you speed-read, you're incurring invisible costs that show up later in your lack of real understanding. Ignorance is more expensive than investing the time necessary to get smarter.
- V. **There's a better solution, anyways.** Learning what a good book really looks like, and learning how to skip the bad ones, is a far more robust time saver than speed-reading. Hope your radar for a great book, be a little ruthless about culling and quitting the weak. Don't waste time reading.
- VI. **Most people want to create the impression they read.** That they have unique insights. That they know what they're talking about. In the end however, when it comes to doing the work, they walk away. That's why there is so much value in reading. Do the work.
- VII. **Do It Correctly, Slowly, Patiently, Methodically, Logically Take It Time and Do Not Rush Process Of Reading.**

Step 35-Slow Down

- 1. Do Not Rush Any Tasks I will do At Any Time.**
- 2. Listen and Apply Book “The Slow Fix Solve Problems, Work Smarter, and Live Better in a World Addicted to Speed”**
- 3. Listen and Apply Book *In Praise Of Slowness Challenging the Cult of Speed BY Carl Honore.**

- I. We live in a world scarce of understanding and abundant with information. We complain that we never have any free time yet we seek distraction. If work can't distract us, we distract ourselves. We crave perpetual stimulation and motion. We're so busy that our free time comes in 20 second bursts, just long enough for us to read the gist and assume we understand. If we are to synthesize learning and understanding we need time to think.
- II. The modern storm of bits and stimulation, relents only when we sleep. (And then only if we remember to turn off the phone.) Lost in all of this is the art of stillness. We live in a world with more information than ever and yet we understand less. We have come into the belief that the simple act of reading confers understanding. Worse, most of our reading is elementary reading, or skimming — a far cry from syntopical reading, which seems more fertile for the mind willing to do the work.
- III. But that's just it. We don't want, or can't find the time, to do the work that's required to hold an opinion. It's much easier to simply read the opinions of another and let them think for us.
- IV. Understanding comes from focusing, chewing, and relentlessly ragging on a problem. It comes with false starts, dead ends, and frustration. Thinking requires time and space. It's slow. It means saying I don't know. In short, thinking is everything the modern workplace is designed to eradicate.
- V. We're expected to have an opinion about everything and yet our time to think is near zero. We hold more opinions than ever but have less understanding. We don't even understand ourselves. How could it be otherwise?
- VI. As Milan Kundera wrote in his 1996 novella Slowness, “When things happen too fast, nobody can be certain about anything, about anything at all, not even about himself. “In our fast-moving modern world, it always seems that the time-train is

pulling out of the station just as we reach the platform. No matter how fast we go, no matter how cleverly we schedule, there are never enough hours in the day.”

VII. Carl Honore, wrote a book, In Praise of Slowness: Challenging the Cult of Speed, to explore why we’re always in such a rush, what if anything is the cure for time-sickness, and whether it’s desirable to slow down. The book is not an all-out declaration of war against speed. Speed has helped to remake our world in ways that are wonderful and liberating. Who wants to live without the Internet or jet travel? The problem is that our love of speed, our obsession with doing more and more in less and less time, has gone too far; it has turned into an addiction, a kind of idolatry. Even when speed starts to backfire, we invoke the go-faster gospel.

VIII. When we rush, we skim the surface, and fail to make real connections with the world or other people.” Moreover we don’t make connections with ideas. We don’t synthesize. We don’t test theories over time. We don’t play with ideas.

IX. The implications on thinking are fascinating. We are all fast-thinkers now. We have forgotten how to look forward to things, and how to enjoy the moment when they arrive. Restaurants report that hurried diners increasingly pay the bill and order a taxi while eating dessert. Many fans leave sporting events early, no matter how close the score is, simply to steal a march on the traffic. Then there is the curse of multi-tasking. Doing two things at once seems so clever, so efficient, so modern. And yet what it often means is doing two things not very well. Like many people, I read the paper while watching TV— and find that I get less out of both. In this media-drenched, data-rich, channel-surfing, computer-gaming age, we have lost the art of doing nothing, of shutting out the background noise and distractions, of slowing down and simply being alone with our thoughts. Boredom — the word itself hardly existed 150 years ago— is a modern invention. Remove all stimulation, and we fidget, panic and look for something, anything, to do to make use of the time. When did you last see someone just gazing out the window on a train? Everyone is too busy reading the paper, playing video games, listening to iPods, working on the laptop, yammering into mobile phones. Instead of thinking deeply, or letting an idea simmer in the back of the mind, our instinct now is to reach for the nearest sound bite. In modern warfare, correspondents in the field and pundits in the studio spew out instant analyses of events as they occur. Often their insights turn out to be wrong. But that hardly matters nowadays: in the land of speed, the man with the instant response is king. With satellite feeds and twenty-four-hour news channels, the electronic media is dominated by what one

French sociologist dubbed “le fast thinker”— a person who can, without skipping a beat, summon up a glib answer to any question.

- X. Fast eats time. One consequence of fast is that we make poor decision after poor decision. Those decisions don’t go away never to be seen again. It’s not like we make a bad decision and we’re done with it. No, the consequences are much worse. Poor decisions eat time. They come back to haunt you. They create issue after issue. They feed into the perpetual motion machine of busyness. And in a culture where people wear busyness as a badge of honor bad decisions actually lead us to think that we’re doing more.

4. Do The Tasks Slowly, and Step By Step.

5. The Art of Slowing down and Do Not Rush Anything.

- I. The Art of Stillness is a persuasively argued case for the pleasures of slowing down and being in one place. Today we’re going faster and faster in search of contentment and meaning. This is largely a recipe for ensuring we will never be happy. We have the sense, too often, of running at top speed and never being able to catch up.
- II. Too many of us see going nowhere as turning away from something rather than turning towards something.
- III. Going nowhere isn’t about turning your back on the world; it’s about stepping away now and then so that you can see the world more clearly and love it more deeply. “There is nothing either good or bad, but thinking makes it so.”
- IV. The idea behind choosing to sit still long enough to learn about yourself is simple and has been around for ages. Marcus Aurelius and Epictetus reminded us many millennia ago that it’s how we respond to our experiences, not the experiences themselves, which shape us.
- V. The greatest weapon against stress is our ability to choose one thought over another. Part of making better decisions is making time to think. Something that few of us are able to do.
- VI. “Our creations come not when we’re out in the world, gathering impressions, but when we’re sitting still, turning those impressions into sentences.

Step 36-Isolating Myself For Deep Study, Deep Work AND Decide The Study or Work Philosophy

1. Listen and Apply Book on Deep Book and Power of Habits.

- I. 7 Habits of Highly Effective Families.
- II. Atomic Habit by James Clear.
- III. Deep Work by Cal Newport.
- IV. The Power of Habit_ Why We Do What We Do in Life and Business.
- V. The Ultimate Focus Strategy_ How to Set the Right Goals, Develop Powerful Focus, Stick to the Process, and Achieve Success.
- VI. Tools of Titans by Tim ferris.

2. Create Physical and Mental Space For Isolated Work.

- I. Collaboration doesn't just happen online or over digital tools. And while most knowledge workers spend their days in **open offices** designed to create more interaction and collaboration. In reality, they rarely do that. Rather than increase our face-to-face interactions, open offices have been found to decrease them by up to 70%.
- II. If you **work at home** or remotely, you're not completely safe from this issue either. Yes, you need a physical space **devoid of distractions** to do focused work. But you also need to create mental space as well. This means getting over the feeling of needing to "catch up" and always be around on Slack and IM.
- III. To stay "bursty" try to only check in at specific times. That way your team knows when you're available and you can schedule your deep work around those periods.
- IV. To be the best collaborator possible, you need to balance between being around and being heads down. And according to the research, there are few better ways to do that then bringing a bit of "burstiness" into your day.

3. Power of Intermittent Isolation For Deep Study and Deep Work.

- I. We're actually more productive, efficient, and creative when we follow the lead of the ants and work "intermittently" rather than trying to be "always on." Especially when it comes to complex problem-solving.
- II. The isolated time helps to come up with the most creative ideas, and then came together as a group to explain, learn from each other, and narrow in on the highest-quality ones to present, I am working In the group.
- III. **We all do better work when we have time for both collaboration and private creative thinking.**
- IV. Constant communication—especially over tools like Slack and instant messengers—actually decrease both our productivity and **creativity**.
- V. Researchers looking at the productivity of remote teams found that those who practiced a "bursty" style of communication—rapid periods of collaboration followed by long periods of silence—were the most successful.
- VI. "During a rapid-fire burst of communication, team members can get input necessary for their work and develop ideas. Conversely, during longer periods of silence everyone is presumably hard at work acting upon the ideas that were exchanged in the communication burst."

4. Decide and Write Study Philosophy I Will Use For Today.

- I. **Monastic Philosophy.** The monastic philosophy involves cutting out all shallow activities to focus on deep work. This is a rather radical approach that focuses entirely on deep work and nothing else for weeks or months on end.
- II. **Bimodal Philosophy.** The bimodal philosophy involves splitting your schedule based on the amount of work. This would look like an individual spending at least a day or weeks on deep work, and once that is completed, the individual will focus on only shallow work. If you do this approach on a weekly basis, you could try to do all your deep work during weekdays, and your shallow work such as responding to emails, using social media, etc. on the weekends.
- III. **Rhythmic Philosophy.** The rhythmic strategy involves doing deep work as a daily habit. While the time of day you do your deep work each day doesn't matter, it's essential that if you choose this strategy, you stick with it. Time blocking certain hours, about 1 to 4 hours each day, to complete your deep work tasks is key. For example, Time blocking from 12 P.M. to 4 P.M. to do all your deep work tasks.

IV. Journalistic Philosophy. Journalistic strategy involves trying to do deep work whenever it fits into your schedule. This is extremely difficult to do. This is because constantly switching from deep to shallow work efficiently is hard and oftentimes only works for those who are more experienced with deep work.

Step 37-The Power of Concentration

- I. Listen and Apply the following book-*The Ultimate Focus Strategy_ How to Set the Right Goals, Develop Powerful Focus, Stick to the Process, and Achieve Success.*
- II. The core of mindfulness is the ability to pay attention. That's exactly what Holmes does when he taps together the tips of his fingers, or exhales a fine cloud of smoke. He is centering his attention on a single element. And somehow, despite the seeming pause in activity, he emerges, time and time again, far ahead of his energetic colleagues.
- III. That's the thing about mindfulness. It seems to slow you down, but it actually gives you the resources you need to speed up your thinking.
- IV. All of humanity's problems stem from man's inability to sit quietly in a room alone."
- V. Step In Concentration
 - A. Eliminate distractions. How do we focus better if we are always bombarded with information? Make a practice to block time in your schedule to do a specific task or activity. During this time, request that you be left alone or go to a place where others are unlikely to disturb you: a library, a coffee shop, a private room.

Close social media and other apps, silence notifications, and keep your phone hidden from sight in a bag or backpack. As described in HBR, researchers found that cognitive capacity was significantly better when the phone was out of sight, not just turned off. Keep Your primary focus is to complete what you need to do. Shutting off both internal and external disturbances can help you to concentrate.
 - B. Reduce multitasking. Attempting to perform multiple activities at the same time makes us *feel* productive. It's also a recipe for lower focus, poor concentration, and lower productivity. And lower productivity can lead to burnout. Examples of multitasking include listening to a podcast while responding to an email or talking to someone over the phone while writing your report. Such multitasking not only hampers your ability to focus but compromises your work quality.

- C. Practice mindfulness and meditation. Meditating or practicing mindfulness activities can strengthen well-being and mental fitness and improve focus. During the meditation process, our brain becomes calmer and our whole body becomes more relaxed. We focus on our breath during the process so that we will not be distracted by our minds. With practice, we can learn to use our breath to bring our attention back to a particular task so that it can be done well even if we get interrupted. Steps in Mindfulness
- A. Step 1: Breathe In Deeply, And Breathe Out Slowly, Letting Yourself Relax.
 - B. Step 2: Gently Ask Your Mind To Keep Aside All Your Worries And Concerns.
 - C. Step 3: Bring More Awareness Into Breathing, Feeling It With Your Senses.
 - D. Step 4: Start Counting Your Breaths Slowly. Bring Your Mind Back If It Wanders.
 - E. Step 5: Get Immersed In The Present, Losing Consciousness Of Your Surroundings.
 - F. Step 6: Accept The Thoughts And Emotions Moving Across Your Mind Just As They Are.
- G. Get more sleep. Many factors affect your sleep. One of the most common is reading from an electronic device like a computer, phone, or tablet or watching your favorite movie or TV show on an LED TV just before bedtime. Research has shown that such devices emit light towards the blue end of the spectrum. Such light will stimulate your eye retina and prevent the secretion of melatonin that promotes sleep anticipation in the brain. Use a filter or "blue light" glasses to minimize such blue light or avoid all electronic devices before bed. Other ways to improve sleep include avoiding exercise late in the day, staying hydrated throughout the day, using journaling or breathing exercises to quiet the mind, and creating a predictable bedtime routine and schedule.
- H. Choose to focus on the moment. It might feel counterintuitive when you feel unable to concentrate, but remember that you choose where you focus. It's tough to concentrate when your mind is always in the

past and worrying about the future. While it isn't easy, make an effort to let go of past events. Acknowledge the impact, what you felt, and what you learned from it, then let it go. Similarly, acknowledge your concerns about the future, consider how you are experiencing that anxiety in your body, then choose to let it go. We want to train our mental resources to focus on the details of what matters at the moment. Our minds go in the direction we choose to focus.

- I. Take a short break. This also might seem counterintuitive, but when you focus on something for a long time, your focus may begin to die down. You may feel more and more difficulty devoting your attention to the task. Researchers have found that our brains tend to ignore sources of constant stimulation. Taking very small breaks by refocusing your attention elsewhere can dramatically improve mental concentration after that. The next time you are working on a project, take a break when you begin to feel stuck. Move around, talk to someone, or even switch to a different type of task. You will come back with a more focused mind to keep your performance high.
- J. Connect with nature. Research has found that even having plants in office spaces can help increase concentration and productivity, as well as workplace satisfaction and better air quality. Finding time to take a walk in the park or appreciating the plants or flowers in your garden can boost your concentration and help you feel refreshed.
- K. Train your brain. Scientific research is starting to amass evidence on the ability of brain training activities to enhance cognitive abilities, including concentration, in adults. Such brain training games can also help you develop your working and short-term memory, as well as your processing and problem-solving skills. Examples of such games include jigsaw puzzles, sudoku, chess, and brain-stimulating video games.
- L. Exercise. Start your day with simple exercise and get your body moving. According to the May 2013 issue of the Harvard Men's Health Watch, regular exercise releases chemicals key for memory, concentration, and mental sharpness. Other research found that exercise can boost the brain's dopamine, norepinephrine, and serotonin levels and all these will affect focus and attention.

Individuals who do some form of exercise or sports perform better on cognitive tasks when compared with those who have poor physical health. Physical movement helps relax the muscles and relieve tension in the body. Since the body and mind are so closely linked, when your body feels better so, too, will your mind.

M. Listen to music. Music has been shown to have therapeutic effects on our brains. Light music may help you to concentrate better, but some music may distract you. Experts generally agree that classical music and nature sounds, such as water flowing, are good choices for concentration while music with lyrics and human voices may be distracting. Multiple apps and services offer background music and soundscapes designed for different types of focus and work needs.

N. Eat well. Choose foods that moderate blood sugar, maintain energy, and fuel the brain. Fruits, vegetables, and high-fibre foods can keep your blood sugar levels even. Reduce sugary foods and drinks that cause spikes and dips in your sugar levels make you feel dizzy or drowsy.

Your brain needs lots of good fat to function properly. Nuts, berries, avocados, and coconut oil are all great ways to get healthy fats into your diet and help your brain run more smoothly. The science on Research has found that foods like blueberries can boost concentration and memory for up to 5 hours after consumption due to an enzyme that stimulates the flow of oxygen and blood to the brain, helping with memory as well as our ability to focus and learn new information. Leafy green vegetables such as spinach contain potassium which accelerates the connections between neurons and can make our brain more responsive.

O. Set a daily priority. Write down what you want to accomplish each day, ideally the night before, and identify a single priority that you commit to accomplishing. This will help focus your brain on what matters, tackling the big jobs first and leaving the small stuff till later. Break large tasks into smaller bytes so that you will not be overwhelmed. Identifying true priorities can help relieve distracting anxiety, and achieving small daily goals can wire your brain to achieve success.

- P. Create space for work.** Create a calm, dedicated space for work, if possible. Not everyone can have a well-appointed office, but desk organizers, noise-canceling headphones, an adjustable monitor, and adjustable lighting can help. Clear clutter out of sight, make it as ergonomic and comfortable as possible, and try to keep your space neat and ventilated.
- Q. Use a timer.** Train your brain to hyper-focus on a task by using a timer or phone alarm. First, decide what task you want to complete. Set your timer for 20 minutes (generally not more than 30 minutes) and concentrate on the task. When the alarm rings take a short break for 5 minutes. You can either take a walk and do some stretching exercise, then reset the timer and start again. This technique has shown to be effective to improve your concentration.
- R. Switch tasks.** While we may want to concentrate on a particular task, sometimes we get stuck and our brain needs something fresh to focus on. Try switching to other tasks or something you love to do. Switching tasks can help you stay alert and productive for a longer period.

Step 38-You Are Required To Do The Work to Have an Opinion on Any Topic

1. When Give Opinion on Anything, Do Not Be so Angry and Mean to Others.
2. People Need To Stop Doing By Coming Unprepared To Give Opinion On Any Subject, Without Having Good Idea Of The Literature, and Arguments Written on Topic and Theme Available To Them. The people coming unprepared and not doing any Hard Work To Have an Opinion On The Subject or Topic. When People Coming Overconfidence, which could be resulting in Lack of Preparation, Which Could Lead That Your Position can be Destroyed with Ease. They simply won't do the work required. It's easy to come home, sit on the couch, watch TV, and zone out until bedtime rolls around. But that's not going to help you get smarter.
 - A. People Who Do Not Put The Required Work: The first thing they always do is tell you what they think. When someone has an opinion about everything, they want to share it with you. They often tout stats and research as if they had an imaginary checklist of facts they need to be able to rattle off to establish themselves as an expert in a field they actually know very little about. Because they have an opinion on everything, they are quick to judge others – for their lack of opinions, for their lack of knowledge, for their lack of outrage, and the list goes on.
 - B. People who have opinions about everything barf so much noise that it's hard to find the signal. Your brain has to work overtime to figure out if they did the work to come up with their opinions themselves or if they're simply regurgitating some oped in a newspaper. Over time, opinionated people also end up in their own prisons and they try to take you with them.
 - C. The problem comes from how we see the world. Our opinions are often rooted in how we think the world should work, according to our morals, values, and principles. If we see the world through the lens of our opinions, much of what happens will not agree with us. This is feedback, and how we respond to this feedback is key.

3. How to Get Smarter Read. A lot. Warren Buffett says, "I just sit in my office and read all day." What does that mean? He estimates that he spends 80% of his working day reading and thinking. When asked how to get smarter, Buffett once held up stacks of paper and said, "Read 500 pages like this every week. That's how knowledge builds up, like compound interest." All of us can build our knowledge, but most of us won't put in the effort. "Go to bed smarter than when you woke up."
4. How Long Does it Take To Prepare:
 - A. Depend on the topic and opponent, and how much he's written.
 - B. If the opponent nothing published, then there was very little preparation to be made because I simply didn't know what to expect.
 - C. On the other hand, if the opponent has published lots of written work and have some videos. Read and what his written and videos and prepare the summaries articles, videos, and have sense where he is coming from. This can take Weeks or Months.
5. Be informed citizen is read more classical books and history. This unfolds how the real world works and where it is going. If You read Classical Books, then you can well predict what would happen next in the future based on the events happening.
6. Do not read the newest books, but the great books of western world, stoic and classics, as these books stood the test of time.
7. Do Not Have the Opinion and do not make any judgement about Anything, I see and hear, If I did not work Hard to have an opinion. I need to Read, Analyse, Research the topic from every angle, so that I can have an opinion or Make Judgement on the topic.

8. Before Preparation. The difference between the people who do the work and the people who just reel off memorized opinions is huge. When you do the work, you can answer the next question. You know when to follow the rules and when they'll get you in trouble. When I did my postgraduate I was surrounded by people who could answer the test questions. They got good grades — actually, they got *great* grades but an odd thing happened after school: a lot of those people couldn't apply their knowledge to problems they hadn't seen before. They were chauffeurs — they knew the memorized answer. They couldn't answer the next question. We're all chauffeurs in some aspects of our lives. This is why understanding your circle of competence is so critical to living a rational life.

I. Circle of Competence:

A. **Circle Of Competence**-Understanding my Circle of Competence helps to avoid problems, identify opportunities for improvement and learn from Others. Circle of Competence is simple: Each of us, through experience or study, has built up useful knowledge on certain areas of the world. Some areas are understood by most of us, while some areas require a lot more specialty to evaluate. For example, most of us have a basic understanding of the economics of a restaurant: You rent or buy space, spend money to outfit the place and then hire employees to seat, serve, cook, and clean. (And, if you don't want to do it yourself, manage.) From there, it's a matter of generating enough traffic and setting the appropriate prices to generate a profit on the food and drinks you serve—after all of your operating expenses have been paid. Though the cuisine, atmosphere, and price points will vary by restaurant, they all have to follow the same economic formula. That basic knowledge, along with some understanding of accounting and a little bit of study, would enable one to evaluate and invest in any number of restaurants and restaurant chains, public or private. It's not all that complicated. Far more important is to honestly define what we do know and stick to those areas. Our circle of competence can be widened, but only slowly and over time. Mistakes are most often made when straying from this discipline. Where should we devote our limited time in life, to achieve the most success? So, the simple takeaway here is clear. If you want to improve your odds of success in life and business, then define the perimeter of your circle of competence, and operate inside. Over time, work to expand that circle

but never fool yourself about where it stands today, and never be afraid to say “I don’t know.”

II. Two Type of Knowledge: The Max Planck and Chauffeur Test

A. The Two Types of Knowledge: The Max Planck and Chauffeur Test: How to distinguish between the two types of knowledge: real knowledge and pretend knowledge.

- The first type of knowledge is real. It can’t be bought. It can’t be copied. If you want real knowledge you need to earn it. One is Planck knowledge, the people who really know. They’ve paid the dues, they have the aptitude. You are going to have the problem in your life of getting the responsibility into the people with the Planck knowledge and away from the people with the chauffeur knowledge. Real knowledge comes when people do the work. The problem is that it’s difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.
- The second type of knowledge is copied. On the surface you know the answer but you lack the understanding to show your work. Then we’ve got chauffeur knowledge. They’ve learned the talk. They may have a big head of hair, they may have fine temper in the voice, they’ll make a hell of an impression. But in the end, all they have is chauffeur knowledge. I think I’ve just described practically every politician in the United States. We have the people who don’t do the work — they pretend. While they’ve learned to put on a good show, they lack understanding. They can’t answer questions that don’t rely on memorization. They can’t explain things without using jargon or vague terms. They have no idea how things interact. They can’t predict the consequences. The problem is that it’s difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.
- How To Distinguish Real Knowledge and Fake Knowledge. With journalists, it is more difficult. Some have acquired true knowledge.

Often they are veteran reporters who have specialized for years in a clearly defined area. They make a serious effort to understand the complexity of a subject and to communicate it. They tend to write long articles that highlight a variety of cases and exceptions. The majority of journalists, however, fall into the category of chauffeur. They conjure up articles off the tops of their heads or, rather, from Google searches. Their texts are one-sided, short, and— often as compensation for their patchy knowledge. The same superficiality is present in business. The larger a company, the more the CEO is expected to possess “star quality.” Dedication, solemnity, and reliability are undervalued, at least at the top. Too often shareholders and business journalists seem to believe that showmanship will deliver better results, which is obviously not the case. One way to guard against this is to understand your circle of competence. Dobelli concludes with some advice worth taking to heart. Be on the lookout for chauffeur knowledge. Do not confuse the company spokesperson, the ringmaster, the newscaster, the schmoozer, the verbiage vendor, or the cliché generator with those who possess true knowledge. How do you recognize the difference? There is a clear indicator: True experts recognize the limits of what they know and what they do not know. If they find themselves outside their circle of competence, they keep quiet or simply say, “I don’t know.” This they utter unapologetically, even with a certain pride. From chauffeurs, we hear every line except this.

III. Batesian Mimicry Problem. Batesian Mimicry: Why Copycats Are Successful.

Mimic and the Real Thing:

- A. "There's two kinds of snakes you come across. There's the Texas Coral Snake, and the Mexican Milk Snake, and they both look exactly alike. The Texas Coral Snake is dangerous, it's venomous, it can kill you in a minute. The Mexican Milk Snake can't do anything to you; it's an impostor." How is it that these two look alike? It's due to a phenomenon called Batesian Mimicry.
- B. In the 1850s, the naturalist Henry Walter Bates found a certain set of butterflies who were clearly *not* of the same species but whose wings looked almost the same to the naked eye. After thinking it over, Bates eventually figured out what was going on: While the butterflies which were toxic to potential predators (the "models") were able to operate freely and relatively unmolested, there had also developed a "mimic" population of butterflies which wasn't toxic at all, yet still went untouched! In fact, biologists eventually figured out that the more toxic and dangerous the "model" was and the more frequently they appeared in the local population, the easier it was for its "mimics" to get by! Predators simply wouldn't take the risk of mixing up the two. If there aren't as many "models" around or they aren't that dangerous, the mimics have a harder time.
- C. This is a wonderful model, and in the practical world we live in, a similar phenomenon abounds: Copycats or "pretenders to the throne" are often very effective, very convincing "mimics" of the true champions. They dress the part, they talk the talk, and they know what buttons to push. But in the end, they are merely chauffeurs. We see a very Batesian effect at work: The more impressive the "model," the more effective its mimics can be in convincing people they too are impressive, and in all the same ways. But for every Warren Buffett (just one by our count), there has been many "future" Warren Buffett's. For every Steve Jobs, there have been many "next" Steve Jobs'. In fact, sometimes even just *appearances* can be quite convincing: now-disgraced Theranos founder Elizabeth Holmes was very fond of wearing a very Steve Jobsian black turtleneck outfit. Because they can be very convincing, we must be wise enough to watch out for Batesian mimicry

— even in ourselves. This brings up an interesting, at times paradoxical, question: Who can best tell the difference between a Coral Snake and its Mimics? The Coral Snake itself. The real thing knows a fake. It's worth taking the time to work on learning all the big ideas you can find, not just the ones you want to learn. In that search, you'll find a host of big winners you didn't even know existed.

9. Preparation:

- A. While we all hold an opinion on almost everything. Have I do the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it?
 - I. I have to do the reading.
 - II. I have to talk to competent people and understand their arguments.
 - III. Never try to be biased toward any of the side, but question both side of the argument.
 - IV. Do not support any side, until all the facts are put out there, clear and obvious.
 - V. Once known all the facts then analyse both sides of the argument like William Lane Craig.
 - VI. I have to think about the key variables and how they interact over time.
 - VII. I have to listen and chase down arguments that run counter to your views.
 - VIII. I have to think about how you might be fooling yourself.
 - IX. I have to see the issue from multiple perspectives.
 - X. I have to think.
 - XI. I need to become your most intelligent critic and have the intellectual honesty to kill some of your best-loved ideas.
 - XII. Be honest with yourself and open minded. ANALYSE both side of the argument logically and see which is true logically. Means has the clear terms, premises are true, and conclusion follows from premises.
 - XIII. Never say your opinion about anything that requires the analysis of the arguments and facts. Work very very hard to have an opinion about anything.
 - XIV. Listen very carefully other side and use ancient method *state the opposition argument in my own words and ask him/her if the argument I

stated in my own words represents correctly their argument and if I UNDERSTOOD Correctly their arguments.

XV. Never use cheap shots to win argument, like logical fallacies.

XVI. Debate and discussion is not about just win at any cost, but let other person to think about your arguments and engage with them. Second reason never use in discussion cheap shots toward other person, but be civil. Third reason is win the debate and discussion. Fourth is find the truth.

B. For Affirmative and Negative Case:

- I. Read, analyse, Research, Syntopicon and Investigate Published Work.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading, Deductive and Inductive Methodology.
 - Investigate Line of logic of My own Arguments
- II. Read Opponents Books, Articles, Newspapers, Blogs. Reading Published work. What objections he would raise against the topic and prepare the responses for each of these points.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of opponent Arguments.
- III. Watch Video. Watching Videos of the opponent. What objections he would raise against the topic and prepare the responses for each of these points.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of My own Arguments.
- IV. Listen The recording that the opposition made, in which he addresses these issues.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of My own Arguments.
- V. Talk with People who are students in his class, who can tell me, privately, insights into his thinking and character.
- VI. If that sounds like a lot of work, just say, “I don’t have an opinion on that; why don’t you tell me how you got to have such a firm one? It sounds like I could learn something.”
- VII. Another way to get smarter, outside of reading, is to surround yourself with people who are not afraid to challenge your ideas. “Develop into a lifelong self-learner through voracious reading; cultivate curiosity and strive to become a little wiser every day.”

10. Compound Knowledge- Are The Resources I will Choose Concentrating On the Expiring Information or Compound Knowledge?

- I. Are on the Resources providing expiring information?
 - A. Will you care about what you're reading in a month? In a year? In five years?
 - B. Are you focused enough on the same thing to build cumulative knowledge or are you too spread out?
 - C. What do you spend time on that's likely to change in the next few years? What's not likely to change?
 - D. What would need to happen for you to stop outsourcing organisation of information to the computer?
- II. Signs of The Information in the resources are expiring
 - A. First, it's marketed to you.
 - B. Second, lacking details and nuance, it's easily digestible. This is why it's commonly telling you what happened, not why it happened or under what conditions it might happen again
 - C. Third, it won't be relevant in a month or a year. Expiring information is one reason I stopped reading most news. It's a false map.
- III. While most of us focus on consuming information that we won't care about next month, let alone next year, focus on knowledge and companies that change very, very slowly or not at all. And because the information he was learning changed slowly he could compound his knowledge over time.
- IV. Doing his own thinking and vacuums up the details. When we don't think for ourselves it's easy to put the blame on someone else, to "pass the buck" so to speak.
- V. When we consume information that doesn't expire or expires slowly; is very detailed; and we spend time thinking about it not passing the buck, we can match patterns. This is how you learn to see what other people are missing. The longer you do this, the more advantage you get.
- VI. Just like the rest of us, Buffett's dependent on information and knowledge to make great decisions. Unlike most of us, he has a great memory—perhaps because he's not trying to outsource his memory or thinking to others.
- VII. A lot of what the snowball is about the concept of learning, and creating, and the advantage of having the information and knowing it. When I came here today one

of the things that I was thinking is that what you do is so much at the intersection, because retrieving information is different from having it already in your head.

VIII. What you do is different. You work on manipulating how you use the information.

In fact, Warren Buffett and Charlie Munger have the files in their head. That's why they aren't really out there googling all the time looking for, trying to look stuff up, because they already know it.

IX. I think a lot of the work that you do here is helpful to the ordinary person, but Warren Buffett or Charlie Munger don't need it. At the same time, the lesson that they have, which is that learning yourself, making yourself as smart as you can is extremely valid, and not just relying on a library where you can look something up all the time, because a lot of times when you need to make a decision, and you need 50 pieces of information, you need to know it then.

11. The Art of Anticipation of Objections.

- A. Analyse My Arguments, and Scrutinise The arguments by using Rules of Reading.
- B. Analyse the arguments of the opponent. Scrutinise Their arguments by using Rules of Reading.
- C. Analyse My own arguments. Scrutinise My own arguments, and the potential Loopholes in the argument by Use Rules of Reading.
- D. Use Think, Logic, Stratagem, Thinking models.
- E. Write.
- F. Prepare The responses to anticipated objections that, I think the opponent will bring up.
- G. Be intellectually Prepared. This means That I need to know my arguments, so well, that nothing new can surprise me. I would also invest lots of time in knowing and know better opposite side arguments. I would read both side of the arguments, and work Hard on analysing the arguments and evidence of both sides. Doing the work required to hold an opinion means you can argue against yourself better than others can. Only then can you say, "I can hold this view because I can't find anyone else who can argue better against my view." Great thinkers, like Charles Darwin, did the work. And it's one of the biggest reasons he's buried at Westminster Abbey. While we all hold an opinion on almost everything. Have I do the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it? If that sounds like a lot of work, just say, "I don't have an opinion on that; why don't you tell me how you got to have such a firm one? It sounds like I could learn something."
- H. Doing the work required to hold an opinion means you can argue against yourself better than others can. Only then can you say, "I can hold this view because I can't find anyone else who can argue better against my view." Great thinkers, like Charles Darwin, did the work. And it's one of the biggest reasons he's buried at Westminster Abbey.
- I. Doing the work counteracts our natural desire to seek out only information that confirms what we believe we know. When Darwin encountered opinions or facts that ran contrary to his ideas, he endeavored not only to listen but also not to rest

until he could either argue better than his challengers or understand how the fact fit. Darwin did the work. It's wasn't easy, but that's the point.

- J. Have the best work ethic on daily basis. This is everyday process, and try to figure it out, the strengths and weaknesses of my position and opposing person position, This leads to the True Confidence.
- K. As Per Kobe Bryant statement: Trivial things should not be taken your attention. The attentions should be focused on things that are very important. Anything outside of the most important things in life, you should not have time for. You Should love the challenge in life, and always be curious, if you can be at the top , as these greats in that area. Always focus on one thing and not multiple things, this gives an edge and advantage over other people, who focusing on multiple things in life. The World Becomes a library to you, to be better at your craft.: Everything you see whether TV show I saw, Books, Journals, I read, whether discussion, debate I listen, people I talk to. Everything was done to try to learn to become better at the craft you're focusing. When you have this point of view, then the world becomes your library to help you to become better at the craft.
- L. I Always need to ask myself: Have I done the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it? If that sounds like a lot of work, just say, "I don't have an opinion on that; why don't you tell me how you got to have such a firm one? It sounds like I could learn something."
- M. I might need to Suspend my judgement and tell them that I do not have an opinion on this specific Topic.
- N. Never Under Prepare, but Vastly Over Prepare for the Opponent and their arguments and responses
- O. Spend years in preparation, take debate class at the college or university. You need to participate in debates. You need to have mock debates, where someone play role of your opponent, and then you respond to them. You need to do reading and learn how to flow the debates. How to construct affirmative case and negative case. You need to take time to prepare and have enormous preparation.
- P. Memorize the arguments for my case

12. When Dialogue, Discussion, Debate Takes A Place.

A. As Affirmative Speaker, you need to present Prima Facie Case for proposition that is under debate. Prima Facie Case will be one that will establish the truth of proposition you are defending. If I am defending proposition that God Exist, I will want to give 3-5 arguments leading to that Conclusion, that God Exists, and then I will lay those out with great clarity in my opening speech, and say this is the groundwork for the debate. I am not interested in talking about other issues for example if Christianity bad for society Then, I come back to those in every speech over and over again. The goal is to make opponent argue on your grounds. You do not go over to his grounds, and let your audience forget, your affirmative case, rather you reorganise opponent speech, so that you answer his objections in so far as they reply to your arguments, so you may answer them in a very different order than he gave them, because you will be seeing for example: now what answer or response did he have to the cosmological argument, I see two basic responses and then you deal with them.

- Make Briefs, where I have suitable objection, and then have two or three responses to those objections.
- Use The Brief During Exchange with the Opponent. File these Briefs into Folders, and spread These Manila Folders out in front of me on Desk, When I am interacting with the Opponent. Once the opponent Rises his point I just pull These briefs from these folders and never have to think on my feet because I am completely prepared. Key is never have to think on the feet to be so well prepared, that I would have my responses ready for anything he brings up.
- Quote Peer Review Scientific Articles on the topic in support the conclusions.

B. Take Notes While the Opposition is speaking:

- How To Take Notes- Flow Chart. By Taking Notes, I am sure that I am responding to my opponent's arguments and everything he brings up.

I. Make 11-12 Columns on the Pad. Prepare the left column in advance of the communication, debate. The Left Column needs to be filled in, if you starting first. If not, then leave left column as blank.

II. First Left Hand Column Are My Arguments.

III. Second Left Hand Column are Opposition Arguments and Responses to My arguments.

IV. Third Left Column are My Responses to the Opponent responses.

V. Fourth Left Hand Column are My Rebuttal.

VI. Fifth Left Hand Column are Opponent Rebuttal.

VII. Sixth Left Hand Column are my Responses to the Opponent rebuttal.

VIII. Seventh Left Hand Column is the Final My Rebuttal.

IX. Eight Left Hand Column is The opponent Rebuttal.

X. Ninth Left Hand Column is my closing statements.

XI. Tenth Left Hand Column is the opponent closing statements.

XII. Eleventh Left Hand Column is the Cross Examination.

- My Answer.

- Opponent Answer.

- My response to the response of the opponent.

C. Always Remind the audience what are your three to five arguments and what are the responses of the opponent, if any to your arguments.

D. Always allow the opponent allow to lay out his argument without interruption.

E. Take the opponent arguments and put in my own words and correctly represent their argument carefully without misrepresentation.

F. Be Honest.

G. Be Open Minded.

H. Always from Your side be honest and rigorous exchange of arguments and counter Arguments from which me and opponent would benefit.

I. One of good technique is whenever you can quote an opponent against himself, this is powerful device. Have the manuscript, point to the footnote, cite the book, and the quotation and have the page number.

J. Never Take Cheap Shots at the Opponent.

- K. Encourage not just trust someone say so, but demand published peer reviewed articles in support of the positions that one take
- L. Always look at the reality of the situation, and do not let the emotion cloud the situation and the execution. Always be in the present and the moment. **Step 40-** Use The Chosen Rules of Reading Method For Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method And Follow Each Steps Of The Method Until Finish All Steps,

Method 21-How To Read A Book

Step 1. Decide, Which Of the Following How To Read A Book By Mortimer Adler Editions I will Use For Analysis Biblical Text.

- **How To Read A Book: The Classical Guide To Intelligent Reading by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book: Revised and Updated by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book: The Art Of Getting A Liberal Education 1940 Edition by Mortimer Adler**
- **How To Read A Book: The Art Of Getting A Liberal Education 1972 Edition by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book:A Guide To Reading The Great Books 1966 Edition by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book: The Classical Guide To Intelligent Reading 1972 Edition by Mortimer Adler and Charles Van Doren.**
- **How To Read A Book 1972 Edition by Mortimer Adler and Charles Van Doren.**
- **Compact Literature**
- **Composition of Literature**

Step 2. Listen How to Read A Book of Your Choice, then follow and apply each Steps in Reading the Book or Text You are Analysing.

Method 22 - How To Read A Book By

Mortimer Adler For Various Books

The First Level of Reading: Elementary Reading

Ours is a time of great interest in and concern about reading. Public officials have declared that the 1970s will be “the decade of reading.” Best-selling books tell us why Johnny can or can’t read. Research and experimentation in all fields of initial reading instruction proceed at an ever-increasing pace.

Three historical trends or movements have converged upon our time to produce this ferment. The first is the continuing effort of the United States to educate all of its citizens, which means, of course, at a minimum, to make them all literate. This effort, which Americans have supported almost from the beginning of the national existence and which is one of the cornerstones of our democratic way of life, has had remarkable results. Near-universal literacy was obtained in the United States earlier than anywhere else, and this in turn has helped us to become the highly developed industrial society that we are at the present day. But there have been enormous problems, too. They can be summed up in the observation that teaching a small percentage of highly motivated children, most of them the children of literate parents, to read—as was the case a century ago—is a far cry from teaching every child to read, no matter how little motivated he may be, or how deprived his background.

The second historical trend is in the teaching of reading itself. As late as 1870, reading instruction was little changed from what it had been in Greek and Roman schools. In America, at least, the so-called ABC method was dominant throughout most of the nineteenth century. Children were taught to sound out the letters of the alphabet individually—hence the name of this method—and to combine them in syllables, first two letters at a time and then three and four, whether the syllables so constructed were meaningful or not. Thus, syllables such as *ab*, *ac*, *ad*, *ib*, *ic* were practiced for the sake of mastery of the language. When a child could name all of a determined number of combinations, he was said to know his ABC’s.

This synthetic method of teaching reading came under heavy criticism around the middle of the last century, and two alternatives to it were proposed. One was a variant on the synthetic ABC method, known as the phonic method. Here the word was recognized by its sounds rather than by its letter-names. Complicated and ingenious systems of printing were evolved for the purpose of representing the different sounds made by a single letter, especially the vowels. If you are fifty or over, it is probable that you learned to read using some variant of the phonic method.

A wholly different approach, analytical rather than synthetic, originated in Germany and was advocated by Horace Mann and other educators after about 1840. This involved teaching the *visual* recognition of whole words before giving any attention to letter-names or letter-sounds. This so-called sight method was later extended so that whole sentences, representing units of thought, were introduced first, with the pupils only later learning to recognize the constituent words and then, finally, the constituent letters. This method was especially popular during the 1920s and 30s, which period was also characterized by the shift in emphasis from oral reading to silent reading. It was found that ability to read orally did not necessarily mean ability to read silently and that instruction in oral reading was not always adequate if silent reading was the goal. Thus, an almost exclusive emphasis on rapid, comprehensive silent reading was a feature of the years from about 1920 to 1925. More recently, however, the pendulum has swung back again toward phonics, which indeed had never entirely left the curriculum.

All of these different methods of teaching elementary reading were successful for some pupils, unsuccessful for others. In the last two or three decades, it has perhaps been the failures that have attracted the most attention. And here the third historical trend comes into play. It is traditional in America to criticize the schools; for more than a century, parents, self-styled experts, and educators themselves have attacked and indicted the educational system. No aspect of schooling has been more severely criticized than reading instruction. The current books have a long ancestry, and every innovation carries in its train a posse of suspicious and, one feels, unpersuadable observers.

The critics may or may not be right, but in any event the problems have taken on a new urgency as the continuing effort to educate all citizens has entered a new phase, resulting in ever-growing high school and college populations. A young man or woman who cannot read very well is hindered in his pursuit of the American dream, but that remains largely a personal matter if he is not in school. If he remains in school or goes to college, however, it is a matter of concern for his teachers as well, and for his fellow students.

Hence, researchers are very active at the present time, and their work has resulted in numerous new approaches to reading instruction. Among the more important new programs are the so-called eclectic approach, the individualized reading approach, the language-experience approach, the various approaches based on linguistic principles, and others based more or less closely on some kind of programmed instruction. In addition, new mediums such as the Initial Teaching Alphabet (i.t.a.) have been employed, and sometimes these involve new methods as well. Still other devices and programs are the "total immersion method," the "foreign-language-school method," and the method known variously as the "see-say," "look-say," "look-and-say," or "word method." Doubtless experiments are now being undertaken in methods and approaches that differ from all of these. It is perhaps too early to tell whether any of these is the long-sought panacea for all reading ills.

Stages of Learning to Read

One useful finding of recent research is the analysis of stages in learning to read. It is now widely accepted that there are at least four more or less clearly distinguishable stages in the child's progress toward what is called mature reading ability. The first stage is known by the term "reading readiness." This begins, it has been pointed out, at birth, and continues normally until the age of about six or seven.

Reading readiness includes several different kinds of preparation for learning to read. Physical readiness involves good vision and hearing. Intellectual readiness involves a minimum level of visual perception such that the child can take in and remember an entire word and the letters that combine to form it. Language readiness involves the ability to speak clearly and to use several sentences in correct order. Personal readiness involves the ability to work with other children, to sustain attention, to follow directions, and the like.

General reading readiness is assessed by tests and is also estimated by teachers who are often skilful at discerning just when a pupil is ready to learn to read. The important thing to remember is that jumping the gun is usually self-defeating. The child who is not yet ready to read is frustrated if attempts are made to teach him, and he may carry over his dislike for the experience into his later school career and even into adult life. Delaying the beginning of reading instruction beyond the reading readiness stage is not nearly so serious, despite the feelings of parents who may fear that their child is "backward" or is not "keeping up" with his peers.

In the second stage, children learn to read very simple materials. They usually begin, at least in the United States, by learning a few sight words, and typically manage to master perhaps three hundred to four hundred words by the end of the first year. Basic skills are introduced at this time, such as the use of context or meaning clues and the beginning sounds of words. By the end of this period pupils are expected to be reading simple books independently and with enthusiasm.

It is incidentally worth observing that something quite mysterious, almost magical, occurs during this stage. At one moment in the course of his development the child, when faced with a series of symbols on a page, finds them quite meaningless. Not much later—perhaps only two or three weeks later—he has discovered meaning in them; he knows that they say "The cat sat on the hat." How this happens no one really knows, despite the efforts of philosophers and psychologists over two and a half millennia to study the phenomenon. Where does meaning come from? How is it that a French child would find the same meaning in the symbols "*Le chat s'asseyait sur le chapeau*"? Indeed, this discovery of meaning in symbols may be the most astounding intellectual feat that any human being ever performs—and most humans perform it before they are seven years old!

The third stage is characterised by rapid progress in vocabulary building and by increasing skill in "unlocking" the meaning of unfamiliar words through context clues. In addition, children at this stage learn to read for different purposes and in different areas of

content, such as science, social studies, language arts, and the like. They learn that reading, besides being something one does at school, is also something one can do on one's own, for fun, to satisfy curiosity, or even to "expand one's horizons."

Finally, the fourth stage is characterized by the refinement and enhancement of the skills previously acquired. Above all, the student begins to be able to assimilate his reading experiences—that is, to carry over concepts from one piece of writing to another, and to compare the views of different writers on the same subject. This, the mature stage of reading, should be reached by young persons in their early teens. Ideally, they should continue to build on it for the rest of their lives.

That they often do not even reach it is apparent to many parents and to most educators. The reasons for the failure are many, ranging all the way from various kinds of deprivations in the home environment—economic, social, and/or intellectual (including parental illiteracy)—to personal problems of all kinds (including total revolt against "the system"). But one cause of the failure is not often noted. The very emphasis on reading readiness and on the methods employed to teach children the rudiments of reading has meant that the other, the higher, levels of reading have tended to be slighted. This is quite understandable, considering the urgency and extent of the problems found on this first level. Nevertheless, effective remedies for the overall reading deficiencies of Americans cannot be found unless efforts are made on *all* levels of reading.

Stages and Levels

We have described four levels of reading, and we have also outlined four stages of learning to read in an elementary fashion. What is the relation between these stages and levels?

It is of paramount importance to recognise that the four stages outlined here are all stages of the first level of reading, as outlined in the previous chapter. They are stages, that is, of elementary reading, which thus can be usefully divided somewhat in the manner of the elementary school curriculum. The first stage of elementary reading—reading readiness—corresponds to pre-school and kindergarten experiences. The second stage—word mastery—corresponds to the first grade experience of the typical child (although many quite normal children are not "typical" in this sense), with the result that the child attains what we can call second-stage reading skills, or first grade ability in reading or first grade literacy. The third stage of elementary reading—vocabulary growth and the utilisation of context—is typically (but not universally, even for normal children) acquired at about the end of the fourth grade of elementary school, and results in what is variously called fourth grade, or functional, literacy—the ability, according to one common definition, to read traffic signs or picture captions fairly easily, to fill out the simpler government forms, and the like. The fourth and final stage of elementary reading is attained at about the time the pupil leaves or graduates from elementary school or junior high school. It is sometimes called eighth grade, ninth grade, or tenth grade literacy. The child is a "mature" reader in the sense that he is now capable of reading almost anything, but still in a relatively

unsophisticated manner. In the simplest terms, he is mature enough to do high school work.

However, he is not yet a “mature” reader in the sense in which we want to employ the term in this book. He has mastered the first level of reading, that is all he can read on his own and is prepared to learn more about reading. *But he does not yet know how to read beyond the elementary level.*

We mention all this because it is highly germane to the message of this book. We assume—we must assume—that you, our reader, have attained ninth grade literacy, that you have mastered the elementary level of reading, which means that you have passed successfully through the four stages described. If you think about it, you realize that we could not assume less. No one can learn from a how-to-do-it book until he can read it; and it is particularly true of a book purporting to teach one to read that its readers must be able to read in some sense of the term.

The difference between aided and unaided discovery comes into play here. Typically, the four stages of elementary reading are attained with the help of living teachers. Children differ in their abilities, of course; some need more help than others. But a teacher is usually present to answer questions and smooth over difficulties that arise during the elementary school years. Only when he has mastered all of the four stages of elementary reading is the child prepared to move on to the higher levels of reading. Only then can he read independently and learn on his own. Only then can he begin to become a really good reader.

Higher Levels of Reading and Higher Education

Traditionally, the high schools of America have provided little reading instruction for their students, and the colleges have provided none. That situation has changed in recent years. Two generations ago, when high school enrollments increased greatly within a relatively short period, educators began to realize that it could no longer be assumed that entering students could read effectively. Remedial reading instruction was therefore provided, sometimes for as many as 75% or more students. Within the last decade, the same situation has occurred at the college level. Thus, of approximately 40,000 freshmen entering the City University of New York in the fall of 1971, upwards of half, or more than 20,000 young people, had to be given some kind of remedial training in reading.

That does not mean, however, that *reading instruction beyond the elementary level* is offered in many U.S. colleges to this day. In fact, it is offered in almost none of them. Remedial reading instruction is not instruction in the higher levels of reading. It serves only to bring students up to a level of maturity in reading that they should have attained by the time they graduated from elementary school. To this day, most institutions of higher learning either do not know how to instruct students in reading beyond the elementary level, or lack the facilities and personnel to do so.

We say this despite the fact that a number of four-year and community colleges have recently instituted courses in speed reading, or in “effective” reading, or “competence” in reading. On the whole (though there are exceptions), these courses are remedial. They are designed to overcome various kinds of failures of the lower schools. They are not designed to take the student beyond the first level or to introduce him to the kinds and levels of reading that are the main subject of this book.

This, of course, should not be the case. A good liberal arts high school, if it does nothing else, ought to produce graduates who are competent analytical readers. A good college, if it does nothing else, ought to produce competent syntopical readers. A college degree ought to represent general competence in reading such that a graduate could read any kind of material for general readers and be able to undertake independent research on almost any subject (for that is what syntopical reading, among other things, enables you to do). Often, however, three or four years of graduate study are required before students attain this level of reading ability, and they do not always attain it even then.

One should not have to spend four years in graduate school in order to learn how to read. Four years of graduate school, in addition to twelve years of preparatory education and four years of college—that adds up to twenty full years of schooling. It should not take that long to learn to read. Something is very wrong if it does.

What is wrong can be corrected. Courses could be instituted in many high schools and colleges that are based on the program described in this book. There is nothing arcane or even really new about what we have to propose. It is largely common sense.

Reading and the Democratic Ideal of Education

We do not want to seem to be mere carping critics. We know that the thunder of thousands of freshmen feet upon the stairs makes it hard to hear, no matter how reasonable the message. And as long as a large proportion, even a majority, of these new students cannot read effectively at the elementary level, we are aware that the first task to be faced must be to teach them to read in the lowest, the largest common-denominator, sense of the term.

Nor, for the moment, would we want it any other way. We are on record as holding that unlimited educational opportunity—or, speaking practically, educational opportunity that is limited only by individual desire, ability, and need—is the most valuable service that society can provide for its members. That we do not yet know how to provide that kind of opportunity is no reason to give up the attempt.

But we must also realize—students, teachers, and laymen alike—that even when we have accomplished the task that lies before us, we will not have accomplished the whole task. We must be more than a nation of functional literates. We must become a nation of truly competent readers, recognizing all that the word *competent* implies. Nothing less will satisfy the needs of the world that is coming.

The Second Level of Reading: Inspectional Reading

Inspectional reading is a true level of reading. It is quite distinct from the level that precedes it (elementary reading) and from the one that follows it in natural sequence (analytical reading). But, as we noted in Chapter 2, the levels of reading are cumulative. Thus, elementary reading is contained in inspectional reading, as, indeed, inspectional reading is contained in analytical reading, and analytical reading in syntopical reading.

Practically, this means that you cannot read on the inspectional level unless you can read effectively on the elementary level. You must be able to read an author's text more or less steadily, without having to stop to look up the meaning of many words, and without stumbling over the grammar and syntax. You must be able to make sense of a majority of the sentences and paragraphs, although not necessarily the best sense of all of them.

What, then, is involved in inspectional reading? How do you go about doing it? The first thing to realize is that there are two types of inspectional reading. They are aspects of a single skill, but the beginning reader is well-advised to consider them as two different steps or activities. The experienced reader learns to perform both steps simultaneously, but for the moment we will treat them as if they were quite distinct.

Inspectional Reading I: Systematic Skimming or Pre-reading

Let us return to the basic situation to which we have referred before. There is a book or other reading matter, and here is your mind. What is the first thing that you do?

Let us assume two further elements in the situation, elements that are quite common. First, you do not know whether you want to read the book. You do not know whether it deserves an analytical reading. But you suspect that it does, or at least that it contains both information and insights that would be valuable to you if you could dig them out.

Second, let us assume—and this is very often the case—that you have only a limited time in which to find all this out.

In this case, what you must do is *skim* the book, or, as some prefer to say, pre-read it. Skimming or pre-reading is the first sub level of inspectional reading. Your main aim is to discover whether the book requires a more careful reading. Secondly, skimming can tell you lots of other things about the book, even if you decide not to read it again with more care.

Giving a book this kind of quick once-over is a threshing process that helps you to separate the chaff from the real kernels of nourishment. You may discover that what you get from skimming is all the book is worth to you for the time being. It may never be worth more. But you will know at least what the author's main contention is, as well as what kind of book he has written, so the time you have spent looking through the book will not have been wasted.

The habit of skimming should not take much time to acquire. Here are some suggestions about how to do it..

1. LOOK AT THE TITLE PAGE AND, IF THE BOOK HAS ONE, AT ITS PREFACE.

Read each quickly. Note especially the subtitles or other indications of the scope or aim of the book or of the author's special angle on his subject. Before completing this step you should have a good idea of the subject, and, if you wish, you may pause for a moment to place the book in the appropriate category in your mind. What pigeonhole that already contains other books does this one belong in?

2. STUDY THE TABLE OF CONTENTS to obtain a general sense of the book's structure; use it as you would a road map before taking a trip. It is astonishing how many people never even glance at a book's table of contents unless they wish to look something up in it. In fact, many authors spend a considerable amount of time in creating the table of contents, and it is sad to think their efforts are often wasted. It used to be a common practice, especially in expository works, but sometimes even in novels and poems, to write very full tables of contents, with the chapters or parts broken down into many subtitles indicative of the topics covered. Milton, for example, wrote more or less lengthy headings, or "Arguments," as he called them, for each book of *Paradise Lost*. Gibbon published his *Decline and Fall of the Roman Empire* with an extensive analytical table of contents for each chapter. Such summaries are no longer common, although occasionally you do still come across an analytical table of contents. One reason for the decline of the practice may be that people are not so likely to read tables of contents as they once were. Also, publishers have come to feel that a less revealing table of contents is more seductive than a completely frank and open one. Readers, they feel, will be attracted to a book with more or less mysterious chapter titles—they will want to read the book to find out what the chapters are about. Even so, a table of contents can be valuable, and you should read it carefully before going on to the rest of the book. At this point, you might turn back to the table of contents of this book, if you have not already read it. We tried to make it as full and informative as we could. Examining it should give you a good idea of what we are trying to do.

3. CHECK THE INDEX if the book has one—most expository works do. Make a quick estimate of the range of topics covered and of the kinds of books and authors referred to. When you see terms listed that seem crucial, look up at least some of the passages cited. (We will have much more to say about crucial terms in Part Two. Here you must make your judgment of their importance on the basis of your general sense of the book, as obtained from steps 1 and 2.) The passages you read may contain the crux—the point on which the book hinges—or the new departure which is the key to the author's approach and attitude. As in the case of the table of contents, you might at

this point check the index of *this* book. You will recognize as crucial some terms that have already been discussed. Can you identify, for example, by the number of references under them, any others that also seem important?

4. If the book is a new one with a dust jacket, **READ THE PUBLISHER'S BLURB.** Some people have the impression that the blurb is never anything but sheer puffery. But this is quite often not true, especially in the case of expository works. The blurbs of many of these books are written by the authors themselves, admittedly with the help of the publisher's public relations department. It is not uncommon for authors to try to summarize as accurately as they can the main points in their book. These efforts should not go unnoticed. Of course, if the blurb is nothing but a puff for the book, you will ordinarily be able to discover this at a glance. But that in itself can tell you something about the work. Perhaps the book does not say anything of importance—and that is why the blurb does not say anything, either. Upon completing these first four steps you may already have enough information about the book to know that you want to read it more carefully, or that you do not want or need to read it at all. In either case, you may put it aside for the moment. If you do not do so, you are now ready to skim the book, properly speaking.
5. From your general and still rather vague knowledge of the book's contents, **LOOK NOW AT THE CHAPTERS THAT SEEM TO BE PIVOTAL TO ITS ARGUMENT.** If these chapters have summary statements in their opening or closing pages, as they often do, read these statements carefully.
6. Finally, **TURN THE PAGES, DIPPING IN HERE AND THERE, READING A PARAGRAPH OR TWO, SOMETIMES SEVERAL PAGES IN SEQUENCE, NEVER MORE THAN THAT.** Thumb through the book in this way, always looking for signs of the main contention, listening for the basic pulse beat of the matter. Above all, do not fail to read the last two or three pages, or, if these are an epilogue, the last few pages of the main part of the book. Few authors are able to resist the temptation to sum up what they think is new and important about their work in these pages. You do not want to miss this, even though, as sometimes happens, the author himself may be wrong in his judgment.
7. **Condemnation before investigation. Set Aside Whatever you been taught and believe about topic and look with fresh eyes and try to hear what text is saying.**

You have now skimmed the book systematically; you have given it the first type of inspectional reading. You should know a good deal about the book at this point, after having spent no more than a few minutes, at most an hour, with it. In particular, you should know whether the book contains matter that you still want to dig out, or whether it deserves no more of your time and attention. You should also be able to place the book even more accurately than before in your mental card catalogue, for further reference if the occasion should ever arise.

Incidentally, this is a very active sort of reading. It is impossible to give any book an inspectional reading without being alert, without having all of one's faculties awake and working. How many times have you daydreamed through several pages of a good book only to wake up to the realization that you have no idea of the ground you have gone over? That cannot happen if you follow the steps outlined here—that is, if you have a system for following a general thread.

Think of yourself as a detective looking for clues to a book's general theme or idea, alert for anything that will make it clearer. Heeding the suggestions we have made will help you sustain this attitude. You will be surprised to find out how much time you will save, pleased to see how much more you will grasp, and relieved to discover how much easier it all can be than you supposed.

Inspectional Reading II: Superficial Reading

The title of this section is intentionally provocative. The word “superficial” ordinarily has a negative connotation. We are quite serious, however, in using the term.

Everyone has had the experience of struggling fruitlessly with a difficult book that was begun with high hopes of enlightenment. It is natural enough to conclude that it was a mistake to try to read it in the first place. But that was not the mistake. Rather it was in expecting too much from the first going over of a difficult book. Approached in the right way, no book intended for the general reader, no matter how difficult, need be a cause for despair.

What is the right approach? The answer lies in an important and helpful rule of reading that is generally overlooked. That rule is simply this: *In tackling a difficult book for the first time, read it through without ever stopping to look up or ponder the things you do not understand right away.*

Pay attention to what you can understand and do not be stopped by what you cannot immediately grasp. Go right on reading past the point where you have difficulties in understanding, and you will soon come to things you do understand. Concentrate on these. Keep on in this way. Read the book through, undeterred and undismayed by the paragraphs, footnotes, comments, and references that escape you. If you let yourself get stalled, if you allow yourself to be tripped up by any one of these stumbling blocks, you are lost. In most cases, you will not be able to puzzle the thing out by sticking to it. You will have a much better chance of understanding it on a second reading, but that requires you to have read the book *through* at least once.

What you understand by reading the book through to the end—even if it is only fifty percent or less—will help you when you make the additional effort later to go back to the places you passed by on your first reading. And even if you never go back, understanding half of a really tough book is much better than not understanding it at all, which will be the case if you allow yourself to be stopped by the first difficult passage you come to.

Most of us were taught to pay attention to the things we did not understand. We were told to go to a dictionary when we met an unfamiliar word. We were told to go to an encyclopedia or some other reference work when we were confronted with allusions or statements we did not comprehend. We were told to consult footnotes, scholarly commentaries, or other secondary sources to get help. But when these things are done *prematurely*, they only impede our reading, instead of helping it.

The tremendous pleasure that can come from reading Shakespeare, for instance, was spoiled for generations of high school students who were forced to go through *Julius Caesar*, *As You Like It*, or *Hamlet*, scene by scene, looking up all the strange words in a glossary and studying all the scholarly footnotes. As a result, they never really read a Shakespearean play. By the time they reached the end, they had forgotten the beginning and lost sight of the whole. Instead of being forced to take this pedantic approach, they should have been encouraged to read the play at one sitting and discuss what they got out of that first quick reading. Only then would they have been ready to study the play carefully and closely because then they would have understood enough of it to learn more.

The rule applies with equal force to expository works. Here, indeed, the best proof of the soundness of the rule—give a book a first superficial reading—is what happens when you do *not* follow it. Take a basic work in economics, for example, such as Adam Smith's classic *The Wealth of Nations*. (We choose this book as an example because it is more than a textbook or a work for specialists in the field. It is a book for the *general* reader.) If you insist on understanding everything on every page before you go on to the next, you will not get very far. In your effort to master the fine points, you will miss the big points that Smith makes so clearly about the factors of wages, rents, profits, and interest that enter into the cost of things, the role of the market in determining prices, the evils of monopoly, the reasons for free trade. You will miss the forest for the trees. You will not be reading well on *any* level.

On Reading Speeds

We described inspectional reading in Chapter 2 as the art of getting the most out of a book in a limited time. In describing it further in the present chapter, we have in no way changed that definition. The two steps involved in inspectional reading are both taken rapidly. The competent inspectional reader will accomplish them both quickly, no matter how long or difficult the book he is trying to read.

That working definition, however, inevitably raises the question, What about speed reading? What is the relation between the levels of reading and the many speed reading courses, both academic and commercial, that are offered at the present day?

We have already suggested that such courses are basically remedial—that is, that they provide instruction mainly, if not exclusively, in reading on the elementary level. But more needs to be said.

Let it be understood at once that we are wholly in favour of the proposition that most people ought to be *able* to read faster than they do. Too often, there are things we *have* to read that are not really worth spending a lot of time reading; if we cannot read them quickly, it will be a terrible waste of time. It is true enough that many people read some things too slowly, and that they ought to read them faster. But many people also read some things too fast, and they ought to read those things more slowly. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.

Our point is really very simple. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem. But this is only one reading problem. The obstacles that stand in the way of comprehension of a difficult book are not ordinarily, and perhaps never primarily, physiological or psychological. They arise because the reader simply does not know what to do when approaching a difficult—and rewarding—book. He does not know the rules of reading; he does not know how to marshal his intellectual resources for the task. No matter how quickly he reads, he will be no better off if, as is too often true, he does not know what he is looking for and does not know when he has found it.

With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at *different speeds*—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

Fixations and Regressions

Speed reading courses properly make much of the discovery—we have known it for half a century or more—that most people continue to sub-vocalise for years after they are first taught to read. Films of eye movements, furthermore, show that the eyes of young or untrained readers “fixate” as many as five or six times in the course of each line that is read. (The eye is blind while it moves; it can only see when it stops.) Thus single words or at the most two-word or three-word phrases are being read at a time, in jumps across the line. Even worse than that, the eyes of incompetent readers regress as often as once every two or three lines—that is, they return to phrases or sentences previously read.

All of these habits are wasteful and obviously cut down reading speed. They are wasteful because the mind, unlike the eye, does not need to “read” only a word or short phrase at a time. The mind, that astounding instrument, can grasp a sentence or even a paragraph at a “glance”—if only the eyes will provide it with the information it needs. Thus the primary task—recognised as such by all speed reading courses—is to correct the fixations and regressions that slow so many readers down. Fortunately, this can be done quite easily. Once it is done, the student can read as fast as his mind will let him, not as slow as his eyes make him.

There are various devices for breaking the eye fixations, some of them complicated and expensive. Usually, however, it is not necessary to employ any device more sophisticated than your own hand, which you can train yourself to follow as it moves more and more quickly across and down the page. You can do this yourself. Place your thumb and first two fingers together. Sweep this “pointer” across a line of type, a little faster than it is comfortable for your eyes to move. Force yourself to keep up with your hand. You will very soon be able to read the words as you follow your hand. Keep practicing this, and keep increasing the speed at which your hand moves, and before you know it you will have doubled or trebled your reading speed.

The Problem of Comprehension

But what exactly have you gained if you increase your reading speed significantly? It is true that you have saved time—but what about comprehension? Has that also increased, or has it suffered in the process?

There is no speed reading course that we know of that does not claim to be able to increase your comprehension along with your reading speed. And on the whole, there is probably some foundation for these claims. The hand (or some other device) used as a timer tends not only to increase your reading rate, but also to improve your concentration on what you are reading. As long as you are following your hand it is harder to fall asleep, to daydream, to let your mind wander. So far, so good. Concentration is another name for what we have called activity in reading. The good reader reads actively, with concentration.

But concentration alone does not really have much of an effect on comprehension, when that is properly understood. Comprehension involves much more than merely being able to answer simple questions of fact about a text. This limited kind of comprehension, in fact, is nothing but the elementary ability to answer the question about a book or other reading material: “What does it say?” The many further questions that, when correctly answered, imply higher levels of comprehension are seldom asked in speed reading courses, and instruction in how to answer them is seldom given.

To make this clearer, let us take an example of something to read. Let us take the Declaration of Independence. You probably have a copy of it available. Take it down and look at it. It occupies less than three pages when printed. How fast should you read it?

The second paragraph of the Declaration ends with the sentence: "To prove this, let facts be submitted to a candid world." The following two pages of "facts," some of which, incidentally, are quite dubious, can be read quickly. It is not necessary to gain more than a general idea of the *kind* of facts that Jefferson is citing, unless, of course, you are a scholar concerned with the historical circumstances in which he wrote. Even the last paragraph, ending with the justly celebrated statement that the signers "mutually pledge to each other our lives, our fortunes, and our sacred honour," can be read quickly. This is a rhetorical flourish, and it deserves what mere rhetoric always deserves. But the first two paragraphs of the Declaration of Independence require more than a first rapid reading.

We doubt that there is anyone who can read those first two paragraphs at a rate much faster than 20 words a minute. Indeed, individual words in the famous second paragraph—words like "inalienable," "rights," "liberty," "happiness," "consent," "just powers"—are worth dwelling over, puzzling about, considering at length. Properly read, for full comprehension, those first two paragraphs of the Declaration might require days, or weeks, or even years.

The problem of speed reading, then, is the problem of comprehension. Practically, this comes down to defining comprehension at levels beyond the elementary. Speed reading courses, for the most part, do not attempt this. It is worth emphasizing, therefore, that it is precisely comprehension in reading that this book seeks to improve. You cannot comprehend a book without reading it analytically; analytical reading, as we have noted, is undertaken primarily for the sake of comprehension (or understanding).

Summary of Inspectional Reading

A few words in summary of this chapter. There is no single right speed at which you should read; the ability to read at various speeds and to know when each speed is appropriate is the ideal. Great speed in reading is a dubious achievement; it is of value only if what you have to read is not really worth reading. A better formula is this: *Every book should be read no more slowly than it deserves, and no more quickly than you can read it with satisfaction and comprehension.* In any event, the speed at which they read, be it fast or slow, is but a fractional part of most people's problem with reading.

Skimming or pre-reading a book is always a good idea; it is necessary when you do not know, as is often the case, whether the book you have in hand is worth reading carefully. You will find that out by skimming it. It is generally desirable to skim even a book that you intend to read carefully, to get some idea of its form and structure.

Finally, do not try to understand every word or page of a difficult book the first time through. This is the most important rule of all; it is the essence of inspectional reading. Do not be afraid to be, or to seem to be, superficial. Race through even the hardest book. You will then be prepared to read it well the second time.

We have now completed our initial discussion of the second level of reading—inspectional reading. We will return to the subject when we come to Part Four, where we

will show what an important role inspectional reading plays in syntopical reading, the fourth and highest level of reading.

However, you should keep in mind during our discussion of the third level of reading—analytical reading—which is described in the second part of this book, that inspectional reading serves an important function at that level, too. The two stages of inspectional reading can both be thought of as anticipations of steps that the reader takes when he reads analytically. The first stage of inspectional reading—the stage we have called systematic skimming—serves to prepare the analytical reader to answer the questions that must be asked during the first stage of that level. Systematic skimming, in other words, anticipates the comprehension of a book's structure. And the second stage of inspectional reading—the stage we have called

superficial reading—serves the reader when he comes to the second stage of reading at the analytical level. Superficial reading is the first necessary step in the interpretation of a book's contents.

Before going on to explain analytical reading, we want to pause for a moment to consider again the nature of reading as an activity. There are certain actions the active or demanding reader must perform in order to read well. We will discuss them in the next chapter.

Inspectional Reading I: Superficial Reading

1. Skimming through Audiobook between 190 words per minute to 375 words per minute or between 1.25-2.5 times speed
2. Normally listen audiobook from beginning to end between 190 words per minute to 285 words per minute or between 1.25-1.9 times speed
3. Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed
4. Read or Listen The Full Book Without Stopping
5. Read or listen 25min and 5min break
 - Read or Listen 20 pages an Hour according Mortimer Adler
6. Read or Listen between 1-50 times the book
7. Speed of Audiobook.
 - Normally listen audiobook from beginning to end between 150 words per minute to 300 words per minute or between 1-2 times speed.
8. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.
9. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem.
10. With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at different speeds—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

Inspectional Reading II: Superficial Reading

1. Read or Listen The Full Book Without Stopping.
2. That rule is simply this: In tackling a difficult book for the first time, read it through without ever stopping to look up or ponder the things you do not understand right away.
3. Pay attention to what you can understand and do not be stopped by what you cannot immediately grasp. Go right on reading past the point where you have difficulties in understanding, and you will soon come to things you do understand. Concentrate on these.

How to Be a Demanding Reader

The rules for reading yourself to sleep are easier to follow than are the rules for staying awake while reading. Get into bed in a comfortable position, make sure the light is inadequate enough to cause a slight eyestrain, choose a book that is either terribly difficult or terribly boring—in any event, one that you do not really care whether you read or not—and you will be asleep in a few minutes. Those who are experts in relaxing with a book do not have to wait for nightfall. A comfortable chair in the library will do any time.

Unfortunately, the rules for keeping awake do not consist in doing just the opposite. It is *possible* to keep awake while reading in a comfortable chair or even in bed, and people have been known to strain their eyes by reading late in light too dim. What kept the famous candlelight readers awake? One thing certainly—it made a difference to them, a great difference, whether or not they read the book they had in hand.

Whether you manage to keep awake or not depends in large part on your goal in reading. If your aim in reading is to profit from it—to grow somehow in mind or spirit—you have to keep awake. That means reading as actively as possible. It means making an effort—an effort for which you expect to be repaid.

Good books, fiction or nonfiction, deserve such reading. To use a good book as a sedative is conspicuous waste. To fall asleep or, what is the same, to let your mind wander during the hours you planned to devote to reading for profit—that is, primarily for understanding—is clearly to defeat your own ends.

But the sad fact is that many people who can distinguish between profit and pleasure—between understanding, on the one hand, and entertainment or the mere satisfaction of curiosity, on the other hand—nevertheless fail to carry out their reading plans. They fail even if they know which books give which. The reason is that they do not know how to be demanding readers, how to keep their mind on what they are doing by making it do the work without which no profit can be earned.

The Essence of Active Reading: The Four Basic Questions a Reader Asks

We have already discussed active reading extensively in this book. We have said that active reading is better reading, and we have noted that inspectional reading is always active. It is an effortful, not an effortless, undertaking. But we have not yet gone to the heart of the matter by stating the one simple prescription for active reading. It is: *Ask questions while you read—questions that you yourself must try to answer in the course of reading.*

Any questions? No. The art of reading on any level above the elementary consists in the habit of asking the right questions in the right order. There are four main questions you must ask about any book.

1. **WHAT IS THE BOOK ABOUT AS A WHOLE?** You must try to discover the leading theme of the book, and how the author develops this theme in an orderly way by subdividing it into its essential subordinate themes or topics.
2. **WHAT IS BEING SAID IN DETAIL, AND HOW?** You must try to discover the main ideas, assertions, and arguments that constitute the author's particular message.
3. **IS THE BOOK TRUE, IN WHOLE OR PART?** You cannot answer this question until you have answered the first two. You have to know what is being said before you can decide whether it is true or not. When you understand a book, however, you are obligated, if you are reading seriously, to make up your own mind. Knowing the author's mind is not enough.
4. **WHAT OF IT?** If the book has given you information, you must ask about its significance. Why does the author think it is important to know these things? Is it important to you to know them? And if the book has not only informed you, but also enlightened you, it is necessary to seek further enlightenment by asking what else follows, what is further implied or suggested.

We will return to these four questions at length in the rest of this book. Stated another way, they become the basic rules of reading with which Part Two is mainly concerned. They are stated here in question form for a very good reason. Reading a book on any level beyond the elementary is essentially an effort on your part to ask it questions (and to answer them to the best of your ability). That should never be forgotten. And that is why there is all the difference in the world between the demanding and the undemanding reader. The latter asks no questions—and gets no answers.

The four questions stated above summarize the whole obligation of a reader. They apply to anything worth reading—a book or an article or even an advertisement. Inspectional reading tends to provide more accurate answers to the first two questions than to the last two, but it nevertheless helps with those also. An analytical reading of a book has not been accomplished satisfactorily until you have answers to those last questions—until you have some idea of the book's truth, in whole or part, and of its significance, if only in your own scheme of things. The last question—What of it?—is probably the most important one in syntopical reading. Naturally, you will have to answer the first three questions before attempting the final one.

Knowing what the four questions are is not enough. You must remember to ask them as you read. The *habit* of doing that is the mark of a demanding reader. More than that, you must know how to answer them precisely and accurately. The trained ability to do that is the *art* of reading.

People go to sleep over good books not because they are unwilling to make the effort, but because they do not know how to make it. Good books are over your head; they would not be good for you if they were not. And books that are over your head weary you unless you can reach up to them and pull yourself up to their level. It is not the stretching that tires you, but the frustration of stretching unsuccessfully because you lack the skill to stretch effectively. To keep on reading actively, you must have not only the will to do so, but also the skill—the art that enables you to elevate yourself by mastering what at first sight seems to be beyond you.

How to Make a Book Your Own

If you have the habit of asking a book questions as you read, you are a better reader than if you do not. But, as we have indicated, merely asking questions is not enough. You have to try to answer them. And although that could be done, theoretically, in your mind only, it is much easier to do it with a pencil in your hand. The pencil then becomes the sign of your alertness while you read.

It is an old saying that you have to “read between the lines” to get the most out of anything. The rules of reading are a formal way of saying this. But we want to persuade you to “write between the lines,” too. Unless you do, you are not likely to do the most efficient kind of reading.

When you buy a book, you establish a property right in it, just as you do in clothes or furniture when you buy and pay for them. But the act of purchase is actually only the prelude to possession in the case of a book. Full ownership of a book only comes when you have made it a part of yourself, and the best way to make yourself a part of it—which comes to the same thing—is by writing in it.

Why is marking a book indispensable to reading it? First, it keeps you awake— not merely conscious, but wide awake. Second, reading, if it is active, is thinking, and thinking tends to express itself in words, spoken or written. The person who says he knows what he thinks but cannot express it usually does not know what he thinks. Third, writing your reactions down helps you to remember the thoughts of the author.

Reading a book should be a conversation between you and the author. Presumably he knows more about the subject than you do; if not, you probably should not be bothering with his book. But understanding is a two-way operation; the learner has to question himself and question the teacher. He even has to be willing to argue with the teacher, once he understands what the teacher is saying. Marking a book is literally an expression of your differences or your agreements with the author. It is the highest respect you can pay him.

There are all kinds of devices for marking a book intelligently and fruitfully. Here are some devices that can be used:

1. UNDERLINING—of major points; of important or forceful statements.
2. VERTICAL LINES AT THE MARGIN—to emphasise a statement already underlined or to point to a passage too long to be underlined.
3. STAR, ASTERISK, OR OTHER DOODAD AT THE MARGIN—to be used sparingly, to emphasise the ten or dozen most important statements or passages in the book. You may want to fold a corner of each page on which you make such marks or place a slip of paper between the pages. In either case, you will be able to take the book off the shelf at any time and, by opening it to the indicated page, refresh your recollection.
4. NUMBERS IN THE MARGIN—to indicate a sequence of points made by the author in developing an argument.
5. NUMBERS OF OTHER PAGES IN THE MARGIN—to indicate where else in the book the author makes the same points, or points relevant to or in contradiction of those here marked; to tie up the ideas in a book, which, though they may be separated by many pages, belong together. Many readers use the symbol “Cf ” to indicate the other page numbers; it means “compare” or “refer to.”
6. CIRCLING OF KEY WORDS OR PHRASES—This serves much the same function as underlining.
7. WRITING IN THE MARGIN, OR AT THE TOP OR BOTTOM OF THE PAGE—to record questions (and perhaps answers) which a passage raises in your mind; to reduce a complicated discussion to a simple statement; to record the sequence of major points right through the book. The endpapers at the back of the book can be used to make a personal index of the author’s points in the order of their appearance. To inveterate book-markers, the front endpapers are often the most important. Some people reserve them for a fancy bookplate. But that expresses only their financial ownership of the book. The front endpapers are better reserved for a record of your thinking. After finishing the book and making your personal index on the back endpapers, turn to the front and try to outline the book, not page by page or point by point (you have already done that at the back), but as an integrated structure, with a basic outline and an order of parts. That outline will be the measure of your understanding of the work; unlike a bookplate, it will express your intellectual ownership of the book.

The Three Kinds of Note-making

There are three quite different kinds of notes that you will make in your books as well as about them. Which kind you make depends upon the level at which you are reading.

When you give a book an inspectional reading, you may not have much time to make notes in it; inspectional reading, as we have observed, is always limited as to time. Nevertheless, you are asking important questions about a book when you read it at this level, and it would be desirable, even if it is not always possible, to record your answers when they are fresh in your mind.

The questions answered by inspectional reading are: first, what kind of book is it? second, what is it about as a whole? and third, what is the structural order of the

work whereby the author develops his conception or understanding of that general subject matter? You may and probably should make notes concerning your answers to these questions, especially if you know that it may be days or months before you will be able to return to the book to give it an analytical reading. The best place to make such notes is on the contents page, or perhaps on the title page, which are otherwise unused in the scheme we have outlined above.

The point to recognize is that these notes primarily concern the structure of the book, and not its substance—at least not in detail. *We therefore call this kind of note-making structural.*

In the course of an inspectional reading, especially of a long and difficult book, you may attain some insights into the author's ideas about his subject matter. Often, however, you will not; and certainly you should put off making any judgment of the accuracy or truth of the statements until you have read the book more carefully. Then, during an analytical reading, you will need to give answers to questions about the truth and significance of the book. The notes you make at this level of reading are, therefore, not structural but *conceptual*. They concern the author's concepts, and also your own, as they have been deepened or broadened by your reading of the book.

There is an obvious difference between structural and conceptual note-making. What kind of notes do you make when you are giving several books a syntopical reading—when you are reading more than one book on a single subject? Again, such notes will tend to be conceptual; and the notes on a page may refer you not only to other pages in that book, but also to pages in other books.

There is a step beyond even that, however, and a truly expert reader can take it when he is reading several books syntopically. That is to make notes about the *shape of the discussion*—the discussion that is engaged in by all of the authors, even if unbeknownst to them. For reasons that will become clear in Part Four, we prefer to call such notes *dialectical*. Since they are made concerning several books, not just one, they often have to be made on a separate sheet (or sheets) of paper. Here, a structure of concepts is implied

—an order of statements and questions about a single subject matter. We will return to this kind of note-making in Chapter 20.

Forming the Habit of Reading

Any art or skill is possessed by those who have formed the habit of operating according to its rules. This is the way the artist or craftsman in any field differs from those who lack his skill.

Now there is no other way of forming a habit of operation than by operating. That is what it means to say one learns to do by doing. The difference between your activity before and after you have formed a habit is a difference in facility and readiness. After practice, you can do the same thing much better than when you started. That is what it means to say practice makes perfect. What you do very imperfectly at first, you gradually come to do with the kind of almost automatic perfection that an instinctive performance has. You do something as if you were born to it, as if the activity were as natural to you as walking or eating. That is what it means to say that habit is second nature.

Knowing the rules of an art is not the same as having the habit. When we speak of a man as skilled in any way, we do not mean that he knows the rules of making or doing something, but that he possesses the habit of making or doing it. Of course, it is true that knowing the rules, more or less explicitly, is a condition of getting the skill. You cannot follow rules you do not know. Nor can you acquire an artistic habit—any craft or skill—without following rules. The art as something that can be taught consists of rules to be followed in operation. The art as something learned and possessed consists of the habit that results from operating according to the rules.

Incidentally, not everyone understands that being an artist consists in operating according to rules. People point to a highly original painter or sculptor and say, “He isn’t following rules. He’s doing something entirely original, something that has never been done before, something for which there are no rules.” But they fail to see what rules it is that the artist follows. There are no final, unbreakable rules, strictly speaking, for making a painting or sculpture. But there are rules for preparing canvas and mixing paints and applying them, and for molding clay or welding steel. Those rules the painter or sculptor must have followed, or else he could not have made the thing he has made. No matter how original his final production, no matter how little it seems to obey the “rules” of art as they have traditionally been understood, he must be skilled to produce it. And this is the art—the skill or craft—that we are talking about here.

From Many Rules to One Habit

Reading is like skiing. When done well, when done by an expert, both reading and skiing are graceful, harmonious activities. When done by a beginner, both are awkward, frustrating, and slow.

Learning to ski is one of the most humiliating experiences an adult can undergo (that is one reason to start young). After all, an adult has been walking for a long time; he knows where his feet are; he knows how to put one foot in front of the other in order to get somewhere. But as soon as he puts skis on his feet, it is as though he had to learn to walk all over again. He slips and slides, falls down, has trouble getting up, gets his skis crossed, tumbles again, and generally looks—and feels—like a fool.

Even the best instructor seems at first to be no help. The ease with which the instructor performs actions that he says are simple but that the student secretly believes are impossible is almost insulting. How can you remember everything the instructor says you have to remember? Bend your knees. Look down the hill. Keep your weight on the downhill ski. Keep your back straight, but nevertheless lean forward. The admonitions seem endless—how can you think about all that and still ski?

The point about skiing, of course, is that you should not be thinking about the separate acts that, together, make a smooth turn or series of linked turns—instead, you should merely be looking ahead of you down the hill, anticipating bumps and other skiers, enjoying the feel of the cold wind on your cheeks, smiling with pleasure at the fluid grace of your body as you speed down the mountain. In other words, you must learn to forget the separate acts in order to perform all of them, and indeed any of them, well. But in order to forget them as separate acts, you have to learn them first as separate acts. Only then can you put them together to become a good skier.

It is the same with reading. Probably you have been reading for a long time, too, and starting to learn all over again can be humiliating. But it is just as true of reading as it is of skiing that you cannot coalesce a lot of different acts into one complex, harmonious performance until you become expert at each of them. You cannot telescope the different parts of the job so that they run into one another and fuse intimately. Each separate act requires your full attention while you are doing it. After you have practiced the parts separately, you can not only do each with greater facility and less attention but can also gradually put them together into a smoothly running whole.

All of this is common knowledge about learning a complex skill. We say it here merely because we want you to realize that learning to read is at least as complex as learning to ski or to typewrite or to play tennis. If you can recall your patience in any other learning experience you have had, you will be more tolerant of instructors who will shortly enumerate a long list of rules for reading.

The person who has had one experience in acquiring a complex skill knows that he need not fear the array of rules that present themselves at the beginning of something new to be learned. He knows that he does not have to worry about how all the separate acts in which he must become separately proficient are going to work together.

The multiplicity of the rules indicates the complexity of the one habit to be formed, not a plurality of distinct habits. The parts coalesce and telescope as each reaches the stage of automatic execution. When all the subordinate acts can be done more or less automatically, you have formed the habit of the whole performance. Then you can think about tackling an expert run you have never skied before, or reading a book that you once thought was too difficult for you. At the beginning, the learner pays attention to himself and his skill in the separate acts. When the acts have lost their separateness in the skill of the whole performance, the learner can at last pay attention to the goal that the technique he has acquired enables him to reach.

We hope we have encouraged you by the things we have said in these pages. It is hard to learn to read well. Not only is reading, especially analytical reading, a very complex activity—much more complex than skiing—it is also much more of a mental activity. The beginning skier must think of physical acts that he can later forget and perform almost automatically. It is relatively easy to think of and be conscious of physical acts. It is much harder to think of mental acts, as the beginning analytical reader must do; in a sense, he is thinking about his own thoughts. Most of us are unaccustomed to doing this. Nevertheless, it can be done, and a person who does it cannot help learning to read much better. [1](#). These four questions, as stated, together with the discussion of them that follows, apply mainly to expository or nonfiction works. However, the questions, when adapted, apply to fiction and poetry as well. The adaptations required are discussed in Chapters 14 and 15.

Inspectional Reading I: Superficial Reading

1. Skimming through Audiobook between 190 words per minute to 375 words per minute or between 1.25-2.5 times speed
2. Normally listen audiobook from beginning to end between 190 words per minute to 285 words per minute or between 1.25-1.9 times speed
3. Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed
4. Read or Listen The Full Book Without Stopping
5. Read or listen 25min and 5min break
 - Read or Listen 20 pages an Hour according Mortimer Adler
6. Read or Listen between 1-50 times the book
7. Speed of Audiobook.
 - Normally listen audiobook from beginning to end between 150 words per minute to 300 words per minute or between 1-2 times speed.
8. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.
9. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem.
10. With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at different speeds—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

Inspectional Reading II: Superficial Reading

1. Read or Listen The Full Book Without Stopping.
2. That rule is simply this: In tackling a difficult book for the first time, read it through without ever stopping to look up or ponder the things you do not understand right away.
3. Pay attention to what you can understand and do not be stopped by what you cannot immediately grasp. Go right on reading past the point where you have difficulties in understanding, and you will soon come to things you do understand. Concentrate on these.

The Third Level of Reading: Analytical Reading

Pigeonholing a Book

We said at the beginning of this book that the instruction in reading that it provides applies to anything you have to or want to read. However, in expounding the rules of analytical reading, as we will do in Part Two, we may seem to be ignoring that fact. We will usually, if not always, refer to the reading of whole books. Why is this so?

The answer is simple. Reading a whole book, and especially a long and difficult one, poses the severest problems any reader can face. Reading a short story is almost always easier than reading a novel; reading an article is almost always easier than reading a book on the same subject. If you can read an epic poem or a novel, you can read a lyric or a short story; if you can read an expository book—a history, a philosophical work, a scientific treatise—you can read an article or abstract in the same field.

Hence everything that we will say about reading books applies to reading other materials of the kinds indicated. You are to understand, when we refer to the reading of books, that the rules expounded refer to lesser and more easily understood materials, too. Sometimes the rules do not apply to the latter in quite the same way, or to the extent that they apply to whole books. Nevertheless, it will always be easy for you to adapt them so that they are applicable.

The Importance of Classifying Books

Analysis of Genre.

RULE 1. YOU MUST KNOW WHAT KIND OF BOOK YOU ARE READING, AND YOU SHOULD KNOW THIS AS EARLY IN THE PROCESS AS POSSIBLE, PREFERABLY BEFORE YOU BEGIN TO READ. Is This a Fiction Book or Non Fiction Book?

You must know, for instance, whether you are reading fiction—a novel, a play, an epic, a lyric—or whether it is an expository work of some sort. Almost every reader knows a work of fiction when he sees it. Or so it seems—and yet this is not always easy. Is *Portnoy's Complaint* a novel or a psychoanalytical study? Is *Naked Lunch* a fiction or a tract against drug abuse, similar to the books that used to recount the horrors of alcohol for the betterment of readers? Is *Gone with the Wind* a romance or a history of the South before and during the Civil War? Do *Main Street* and *The Grapes of Wrath* belong in the category of belles-lettres or are both of them sociological studies, the one concentrating on urban experiences, the other on agrarian life?

All of these, of course, are novels; all of them appeared on the fiction side of the best-seller lists. Yet the questions are not absurd. Just by their titles, it would be hard to tell in the case of *Main Street* and *Middletown* which was fiction and which was social science.

There is so much social science in some contemporary novels, and so much fiction in much of sociology, that it is hard to keep them apart. But there is another kind of science, too—physics and chemistry, for instance—in books like *The Andromeda Strain* or the novels of Robert Heinlein or Arthur C. Clarke. And a book like *The Universe and Dr. Einstein*, while clearly not fiction, is almost as “readable” as a novel, and probably more readable than some of the novels of, say, William Faulkner.

An expository book is one that conveys knowledge primarily, “knowledge” being construed broadly. Any book that consists primarily of opinions, theories, hypotheses, or speculations, for which the claim is made more or less explicitly that they are true in some sense, conveys knowledge in this meaning of knowledge and is an expository work. As with fiction, most people know an expository work when they see it. Here, however, the problem is not to distinguish nonfiction from fiction, but to recognize that there are various kinds of expository books. It is not merely a question of knowing which books are primarily instructive, but also which are instructive in a particular way. The kinds of information or enlightenment that a history and a philosophical work afford are not the same. The problems dealt with by a book on physics and one on morals are not the same, nor are the methods the writers employ in solving such different problems.

Thus this first rule of analytical reading, though it is applicable to all books, applies particularly to nonfictional, expository works. How do you go about following the rule, particularly its last clause?

As we have already suggested, you do so by first inspecting the book—giving it an inspectional reading. You read the title, the subtitle, the table of contents, and you at least glance at the preface or introduction by the author and at the index. If the book has a dust jacket, you look at the publisher’s blurb. These are the signal flags the author waves to let you know which way the wind is blowing. It is not his fault if you will not stop, look, and listen.

What You Can Learn from the Title of a Book

The numbers of readers who pay no attention to the signals is larger than you might expect. We have had this experience again and again with students. We have asked them what a book was about. We have asked them, in the most general terms, to tell us what sort of book it was. This is a good way, almost an indispensable way, to begin a discussion of a book. Nevertheless, it is often hard to get any kind of answer to the question.

Let us take a couple of examples of the kind of confusion that can occur. In 1859, Darwin published a very famous book. A century later the entire English-speaking world celebrated the publication of the book. It was discussed endlessly, and its influence was assessed by learned and not-so-learned commentators. The book was about the theory of evolution, and the word “species” was in the title. What was the title?

Probably you said *The Origin of Species*, in which case you were correct. But you might not have said that. You might have said that the title was *The Origin of the Species*. Recently, we asked some twenty-five reasonably well-read persons what the title of Darwin's book was and more than half said *The Origin of the Species*. The reason for the mistake is obvious; they supposed, never having read the book, that it had something to do with the development of the human species. In fact, it has little or nothing to do with that subject, which Darwin covered in a later book, *The Descent of Man*. *The Origin of Species* is about what its title says it is about—namely the proliferation in the natural world of a vast number of species of plants and animals from an originally much smaller number of species, owing mainly to the principle of natural selection. We mention this common error because many think they know the title of the book, although few have actually ever read the title carefully and thought about what it means.

Here is another example. In this case we will not ask you to remember the title, but to think about what it means. Gibbon wrote a famous, and famously long, book about the Roman Empire. He called it *The Decline and Fall of the Roman Empire*. Almost everybody who takes up the book recognizes that title; and most people, even without the book in their hand, know the title. Indeed, the phrase “decline and fall” has become proverbial. Nevertheless, when we asked the same twenty-five well-read people why the first chapter is called “The Extent and Military Force of the Empire in the Age of the Antonines,” they had no idea. They did not see that if the book as a whole was titled *Decline and Fall*, then it might be assumed that the narrative would begin with the high point of the Roman Empire, and continue through to the end. Unconsciously, they had translated “decline and fall” into “rise and fall.” They were puzzled because there was no discussion of the Roman Republic, which ended a century and a half before the Age of the Antonines. If they had read the title carefully they could have assumed that the Age of the Antonines was the high point of the Empire, even if they had not known it before. Reading the title, in other words, could have given them essential information about the book before they started to read it; but they had failed to do that, as most people fail to do even with an unfamiliar book.

One reason why titles and prefaces are ignored by many readers is that they do not think it important to classify the book they are reading. They do not follow this first rule of analytical reading. If they tried to follow it, they would be grateful to the author for helping them. Obviously, the author thinks it is important for the reader to know the kind of book he is being given. That is why he goes to the trouble of making it plain in the preface, and usually tries to make his title—or at least his subtitle—descriptive. Thus, Einstein and Infeld, in their preface to *The Evolution of Physics*, tell the reader that they expect him to know “that a scientific book, even though popular, must not be read in the same way as a novel.” They also construct an analytical table of contents to advise the reader in advance of the details of their treatment. In any event, the chapter headings listed in the front serve the purpose of amplifying the significance of the main title.

The reader who ignores all these things has only himself to blame if he is puzzled by the question, What kind of book is this? He is going to become more perplexed. If he cannot answer that question, and if he never asks it of himself, he is going to be unable to answer a lot of other questions about the book. Important as reading titles is, it is not

enough. The clearest titles in the world, the most explicit front matter, will not help you to classify a book unless you have the broad lines of classification already in your mind.

You will not know the sense in which Euclid's *Elements of Geometry* and William James' *Principles of Psychology* are books of the same sort if you do not know that psychology and geometry are both sciences—and, incidentally, if you do not know that “elements” and “principles” mean much the same thing in these two titles (though not in general), nor will you further be able to distinguish them as different unless you know there are different kinds of science. Similarly, in the case of Aristotle's *Politics* and Adam Smith's *The Wealth of Nations*, you can tell how these books are alike and different only if you know what a practical problem is, and what different kinds of practical problems there are.

Titles sometimes make the grouping of books easy. Anyone would know that Euclid's *Elements*, Descartes' *Geometry*, and Hilbert's *Foundations of Geometry* are three mathematical books, more or less closely related in subject matter. This is not always the case. It might not be so easy to tell from the titles that Augustine's *The City of God*, Hobbes' *Leviathan*, and Rousseau's *Social Contract* are political treatises, although a careful perusal of their chapter headings would reveal the problems that are common to these three books.

Again, however, to group books as being of the same kind is not enough; to follow this first rule of reading you must know *what that kind is*. The title will not tell you, nor all the rest of the front matter, nor even the whole book itself sometimes, unless you have some categories you can apply to classify books intelligently. In other words, this rule has to be made a little more intelligible if you are to follow it intelligently. It can only be made intelligible by drawing distinctions and thus creating categories that make sense and will stand up to the test of time.

We have already discussed a rough classification of books. The main distinction, we said, was between works of fiction, on the one hand, and works conveying knowledge, or expository works, on the other hand. Among expository works, we can further distinguish history from philosophy, and both from science and mathematics.

Now this is all very well as far as it goes. This is a classification scheme with fairly perspicuous categories, and most people could probably place most books in the right category if they thought about it. But not all books in all categories.

The trouble is that as yet we have no principles of classification. We will have more to say about these principles as we proceed in our discussion of the higher levels of reading. For the moment, we want to confine ourselves to one basic distinction, a distinction that applies across the board to all expository works. It is the distinction between theoretical and practical works.

Practical vs. Theoretical Books

Everyone uses the words “theoretical” and “practical,” but not everyone knows what they mean, perhaps least of all the hardheaded practical man who distrusts all theorists, especially if they are in the government. For such persons, “theoretical” means visionary or even mystical; “practical” means something that works, something that has an immediate cash return. There is an element of truth in this. The practical has to do with what works in some way, at once or in the long run. The theoretical concerns something to be seen or understood. If we polish the rough truth that is here being grasped, we come to the distinction between knowledge and action as the two ends a writer may have in mind.

But, you may say, in dealing with expository books, are we not dealing with books that convey knowledge? How does action come into it? The answer, of course, is that intelligent action depends on knowledge. Knowledge can be used in many ways, not only for controlling nature and inventing useful machines or instruments but also for directing human conduct and regulating man’s operations in various fields of skill. What we have in mind here is exemplified by the distinction between pure and applied science, or, as it is sometimes very inaccurately expressed, between science and technology.

Some books and some teachers are interested only in the knowledge itself that they have to communicate. This does not mean that they deny its utility, or that they insist that knowledge is good *only* for its own sake. They simply limit themselves to one kind of communication or teaching, and leave the other kind to other men. These others have an interest beyond knowledge for its own sake. They are concerned with the problems of human life that knowledge can help to solve. They communicate knowledge, too, but always with a view to and an emphasis upon its application.

To make knowledge practical we must convert it into rules of operation. We must pass from knowing *what is the case* to knowing *what to do about it if we wish to get somewhere*. This can be summarized in the distinction between knowing *that* and knowing *how*. Theoretical books teach you *that* something is the case. Practical books teach you *how* to do something you want to do or think you should do.

This book is practical, not theoretical. Any guidebook is a practical book. Any book that tells you either what you *should* do or *how* to do it is practical. Thus you see that the class of practical books includes all expositions of arts to be learned, all manuals of practice in any field, such as engineering or medicine or cooking, and all treatises that are conveniently classified as moral, such as books on economic, ethical, or political problems. We will later explain why this last group of books, properly called “normative,” constitutes a very special category of practical books.

Probably no one would question our calling expositions of arts to be learned and manuals or rule books, practical works. But the “practical” man to whom we have referred might object to the notion that a book on ethics, say, or one on economics, was practical. He might say that such a book was not practical because it was not true or would not work.

In fact, this is irrelevant to the point, although a book about economics that is not true is a bad book. Strictly speaking, any ethical work teaches us how to live our lives, tells us what we should do and not do, and often informs us of the rewards and punishments attached to doing and not doing it. Thus, whether or not we agree with its conclusions, any such work is practical. (Some modern sociological studies merely report the actual behavior of men, without judging it. These are neither ethical nor practical books. They are theoretical works—works of science.)

Similarly with a work on economics. Apart from reportorial, mathematical, or statistical studies of economic behavior, which are theoretical rather than practical, such works usually teach us how to organize our economic life, either as individuals or as societies or states, tell us what we should do and not do, and also inform us of the penalties involved if we do not do what we should. Again, we may disagree, but our disagreement does not make the book unpractical.

Immanuel Kant wrote two famous philosophical works, one called *The Critique of Pure Reason*, the other, *The Critique of Practical Reason*. The first is about what is and how we know it—not how *to* know it, but how we in fact *do* know it—as well as about what can and cannot be known. It is a theoretical book *par excellence*. *The Critique of Practical Reason* is about how men should conduct themselves and about what constitutes virtuous or right conduct. This book places great emphasis on duty as the basis of all right action, and that emphasis may seem repellent to many modern readers. They may even say it is “impractical” to believe that duty is any longer a useful ethical concept. What they mean, of course, is that Kant is wrong, in their opinion, in his basic approach. But that does not mean that his book is any less a practical work in the sense we are employing here.

Apart from manuals and moral treatises (in the broad sense) one other instance of practical writing should be mentioned. An oration—a political speech or moral exhortation—certainly tries to tell you what you should do or how you should feel about something. Anyone who writes practically about anything not only tries to advise you but also tries to persuade you to follow his advice. Hence there is an element of oratory or exhortation in every moral treatise. It is also present in books that try to teach an art, such as this one. Thus, in addition to trying to teach you to read better, we have tried, and will continue to try, to persuade you to make the effort to do so.

Although every practical book is somewhat oratorical and hortatory, it does not follow that oratory and exhortation are coextensive with the practical. There is a difference between a political harangue and a treatise on politics, between economic propaganda and an analysis of economic problems. The *Communist Manifesto* is a piece of oratory, but Marx's *Capital* is much more than that.

Sometimes you can detect that a book is practical by its title. If the title contains such phrases as “the art of ” or “how to,” you can spot it at once. If the title names fields that you know are practical, such as ethics or politics, engineering or business, and in many cases economics, law, or medicine, you can classify the book fairly readily.

Titles can tell you even more than that. John Locke wrote two books with similar titles: *An Essay Concerning Human Understanding* and *A Treatise Concerning the Origin, Extent, and End of Civil Government*. Which of these is theoretical, which practical?

From the titles alone we may conclude that the first is theoretical, because any analysis of understanding would be theoretical, and that the second is practical, because problems of government are themselves practical. But one could go beyond that, employing the techniques of inspectional reading that we have described.

Locke wrote an introduction to the book on understanding. There he expressed his intention as being to inquire into the “origin, certainty, and extent of human knowledge.” The phrasing resembles the title of the book on government, but with one important difference. Locke was concerned with the *certainty* or validity of knowledge in the one case, and with the *end* or purpose of government in the other. Questions about the validity of something are theoretical, whereas to raise questions about the end of anything, the purpose it serves, is practical.

In describing the art of inspectional reading, we noted that you should not ordinarily stop after reading the front matter of a book and perhaps its index. You should read passages in the book that appear to be of a summary nature. You should also read the beginning and end of the book and of its major parts.

This becomes necessary when, as is sometimes the case, it is impossible to classify a book from its title and other front matter. In that case, you have to depend on signs to be found in the main body of the text. By paying attention to the words and keeping the basic categories in mind, you should be able to classify a book without reading very far.

A practical book will soon betray its character by the frequent occurrence of such words as “should” and “ought,” “good” and “bad,” “ends” and “means.” The characteristic statement in a practical book is one that says that something should be done (or made); or that this is the right way of doing (or making) something; or that one thing is better than another as an end to be sought, or a means to be chosen. In contrast, a theoretical book keeps saying “is,” not “should” or “ought.” It tries to show that something is true, that these are the facts; not that things would be better if they were otherwise, and here is the way to make them better.

Before turning to theoretical books, let us caution you against supposing that the problem is as simple as telling whether you are drinking coffee or milk. We have merely suggested some signs whereby you can begin to make discriminations. The better you understand everything that is involved in the distinction between the theoretical and the practical, the better you will be able to use the signs.

For one thing, you will have to learn to mistrust them. You have to be suspicious in classifying books. We have noted that although economics is primarily and usually a practical matter, there are nevertheless books on economics that are purely theoretical. Similarly, although understanding is primarily and usually a theoretical matter, there are books (most of them are terrible) that purport to teach you “how to think.” You will also find

authors who do not know the difference between theory and practice, just as there are novelists who do not know the difference between fiction and sociology. You will find books that are partly of one sort and partly of another, such as Spinoza's *Ethics*. It remains, nevertheless, to your advantage as a reader to detect the way an author approaches his problem.

Kinds of Theoretical Books

The traditional subdivision of theoretical books classifies them as history, science, and philosophy. Everybody knows the differences here in a rough way. It is only when you try to refine the obvious, and give the distinctions greater precision, that you get into difficulties. For the moment, let us try to skirt that danger and let rough approximations suffice.

In the case of history, the title usually does the trick. If the word "history" does not appear in the title, the rest of the front matter is likely to inform us that this is a book about something that happened in the past—not necessarily in the far past, of course, because it may have happened only yesterday. The essence of history is narration. History is knowledge of particular events or things that not only existed in the past but also underwent a series of changes in the course of time. The historian narrates these happenings and often colors his narrative with comment on, or insight into, the significance of the events.

History is chronotopic. *Chronos* is the Greek word for time, *topos* the Greek word for place. History always deals with things that existed or events that occurred on a particular date and in a particular place. The word "chronotopic" can remind you of that.

Science is not concerned with the past as such. It treats of matters than can happen at *any* time or place. The scientist seeks laws or generalizations. He wants to find out how things happen for the most part or in every case, not, as the historian does, how some particular things happened at a given time and place in the past.

The title of a scientific work is usually less revealing than the title of a history book. The word "science" sometimes appears, but more often the name of the subject matter appears, such as psychology or geology or physics. Then we must know whether that subject matter belongs to the scientist, as geology clearly does, or to the philosopher, as metaphysics clearly does. The trouble comes with the cases that are not so clear, such as physics and psychology, which have been claimed, at various times, by both scientists and philosophers. There is even trouble with the very words "philosophy" and "science," for they have been variously used. Aristotle called his book on *Physics* a scientific treatise, although according to current usage we should regard it as philosophical; and Newton titled his great work *Mathematical Principles of Natural Philosophy*, though for us it is one of the masterpieces of science.

Philosophy is like science and unlike history in that it seeks general truths rather than an account of particular events, either in the near or distant past. But the philosopher does

not ask the same questions as the scientist, nor does he employ the same kind of method to answer them.

Since titles and subject-matter names are not likely to help us determine whether a book is philosophical or scientific, how can we tell? There is one criterion that we think always works, although you may have to read a certain amount of the book before you can apply it. If a theoretical book emphasizes things that lie outside the scope of your normal, routine, daily experience, it is a scientific work. If not, it is philosophical.

The distinction may be surprising. Let us illustrate it. (Remember that it applies only to books that are either science or philosophy, not to books that are neither.) Galileo's *Two New Sciences* requires you to imagine, or to repeat for yourself in a laboratory, certain experiments with inclined planes. Newton's *Opticks* refers to experiences in dark rooms with prisms, mirrors, and specially controlled rays of light. The special experience to which the author refers may not have been obtained by him in a laboratory. The facts that Darwin reported in *The Origin of Species* he observed in the course of many years of work in the field. They are facts that can be and have been rechecked by other observers making a similar effort. But they are not facts that can be checked in terms of the ordinary daily experience of the average man.

In contrast, a philosophical book appeals to no facts or observations that lie outside the experience of the ordinary man. A philosopher refers the reader to his own normal and common experience for the verification or support of anything the writer has to say. Thus, Locke's *Essay Concerning Human Understanding* is a philosophical work in psychology, whereas many of Freud's writings are scientific. Locke makes every point in terms of the experience all of us have of our own mental processes. Freud can make many of his points only by reporting what he observed under the clinical conditions of the psychoanalyst's office.

William James, another great psychologist, took an interesting middle course. He reports many examples of the special experience that only the careful, trained observer can know about, but he also frequently asks the reader to judge whether what is being said is not true from his own experience. Thus James' *Principles of Psychology* is both a scientific and a philosophical work, although it is primarily scientific.

The distinction proposed here is popularly recognized when we say that science is experimental or depends upon elaborate observational researches, whereas philosophy is merely armchair thinking. The contrast should not be invidious. There are certain problems, some of them very important, that can be solved in an armchair by a man who knows how to think about them in the light of common, human experience. There are other problems that no amount of the best armchair thinking can solve. What is needed to solve them is investigation of some sort—experiments in the laboratory or research in the field—extending experience beyond the normal, everyday routine. Special experience is required.

This does not mean that the philosopher is a pure thinker and the scientist merely an observer. Both have to observe and think, but they think about different sorts of

observations. And however they may have arrived at the conclusions that they want to prove, they prove them in different ways, the scientist by pointing to the results of his special experiences, the philosopher by pointing to experiences that are common to all.

This difference in method always reveals itself in philosophical and scientific books, and that is how you can tell which sort of book you are reading. If you note the sort of experience that is being referred to as a condition of understanding what is being said, you will know whether the book is scientific or philosophical.

It is important to know this because, apart from the different kinds of experiences that they depend on, scientists and philosophers do not think in exactly the same way. Their styles in arguing are different. You must be able to find the terms and propositions—here we are getting a little ahead of ourselves—that constitute these different sorts of argumentation.

The same is true of history. Historical statements are different from scientific and philosophical ones. A historian argues differently and interprets facts differently. Furthermore, the typical history book is narrative in form. A narrative is a narrative, whether it be fact or fiction. The historian must write poetically, which means he must obey the rules for telling a good story. Whatever other excellences Locke's *Essay on Human Understanding* or Newton's *Principia* may have, neither is a good story.

You may object that we are making too much of the classification of books, at least before one has read them. Is it really all that important?

We may be able to meet the objections by calling your attention to one obvious fact. If you walked into a classroom in which a teacher was lecturing or otherwise instructing students, you could tell very soon whether the class was one in history, science, or philosophy. There would be something in the way the teacher proceeded, the kind of words he used, the type of arguments he employed, the sort of problems he proposed, and the kind of responses he expected from his students, that would give him away as belonging to one department or another. And it would make a difference to you to know this, if you were going to try to listen intelligently to what went on.

In short, the methods of teaching different kinds of subject matter are different. Any teacher knows this. Because of the difference in method and subject matter, the philosopher usually finds it easier to teach students who have not been previously taught by his colleagues, whereas the scientist prefers the student whom his colleagues have already prepared. And so forth and so on.

Now, just as there is a difference in the art of teaching in different fields, so there is a reciprocal difference in the art of being taught. The activity of the student must somehow be responsive to the activity of the instructor. The relation between books and their readers is the same as that between teachers and their students. Hence, as books differ in the kinds of knowledge they have to communicate, they proceed to instruct us differently; and, if we are to follow them, we must learn to read each kind in an appropriate manner. Analyse the Book based on each Book Genre. Below are list of the Kind of Books.

Different Kind Of Books

1. Practical vs. Theoretical Books.

Everyone uses the words “theoretical” and “practical,” but not everyone knows what they mean, perhaps least of all the hardheaded practical man who distrusts all theorists, especially if they are in the government. For such persons, “Theoretical” means visionary or even mystical; “practical” means something that works, something that has an immediate cash return. There is an element of truth in this. The practical has to do with what works in some way, at once or in the long run.

- I. The theoretical concerns something to be seen or understood. If we polish the rough truth that is here being grasped, we come to the distinction between knowledge and action as the two ends a writer may have in mind. But, you may say, in dealing with expository books, are we not dealing with books that convey knowledge? How does action come into it? The answer, of course, is that intelligent action depends on knowledge. Knowledge can be used in many ways, not only for controlling nature and inventing useful machines or instruments but also for directing human conduct and regulating man’s operations in various fields of skill. What we have in mind here is exemplified by the distinction between pure and applied science, or, as it is sometimes very inaccurately expressed, between science and technology. Some books and some teachers are interested only in the knowledge itself that they have to communicate. This does not mean that they deny its utility, or that they insist that knowledge is good only for its own sake. They simply limit themselves to one kind of communication or teaching, and leave the other kind to other men. These others have an interest beyond knowledge for its own sake. They are concerned with the problems of human life that knowledge can help to solve. They communicate knowledge, too, but always with a view to and an emphasis upon its application. To make knowledge practical we must convert it into rules of operation. We must pass from knowing what is the case to knowing what to do about it if we wish to get somewhere. This can be summarized in the distinction between knowing that and knowing how. Theoretical books teach you that something is the case. Practical books teach you how to do something you want to do or think you should do.
- II. This book is practical, not theoretical. Any guidebook is a practical book. Any book that tells you either what you should do or how to do it is practical. Thus you see that the class of practical books includes all expositions of arts to be learned, all manuals of practice in any field, such as engineering or medicine or cooking, and all treatises that are conveniently classified as moral, such as books on economic, ethical, or

political problems. We will later explain why this last group of books, properly called “normative,” constitutes a very special category of practical books. Probably no one would question our calling expositions of arts to be learned and manuals or rule books, practical works. But the “practical” man to whom we have referred might object to the notion that a book on ethics, say, or one on economics, was practical. He might say that such a book was not practical because it was not true or would not work. In fact, this is irrelevant to the point, although a book about economics that is not true is a bad book. Strictly speaking, any ethical work teaches us how to live our lives, tells us what we should do and not do, and often informs us of the rewards and punishments attached to doing and not doing it. Thus, whether or not we agree with its conclusions, any such work is practical. (Some modern sociological studies merely report the actual behavior of men, without judging it. These are neither ethical nor practical books. They are theoretical works—works of science.) Similarly with a work on economics. Apart from reportorial, mathematical, or statistical studies of economic behavior, which are theoretical rather than practical, such works usually teach us how to organize our economic life, either as individuals or as societies or states, tell us what we should do and not do, and also inform us of the penalties involved if we do not do what we should. Again, we may disagree, but our disagreement does not make the book unpractical. Immanuel Kant wrote two famous philosophical works, one called *The Critique of Pure Reason*, the other, *The Critique of Practical Reason*. The first is about what is and how we know it—not how to know it, but how we in fact do know it—as well as about what can and cannot be known. It is a theoretical book par excellence. *The Critique of Practical Reason* is about how men should conduct themselves and about what constitutes virtuous or right conduct. This book places great emphasis on duty as the basis of all right action, and that emphasis may seem repellent to many modern readers. They may even say it is “impractical” to believe that duty is any longer a useful ethical concept. What they mean, of course, is that Kant is wrong, in their opinion, in his basic approach. But that does not mean that his book is any less a practical work in the sense we are employing here. Apart from manuals and moral treatises (in the broad sense) one other instance of practical writing should be mentioned. An oration—a political speech or moral exhortation—certainly tries to tell you what you should do or how you should feel about something. Anyone who writes practically about anything not only tries to advise you but also tries to persuade you to follow his advice. Hence there is an element of oratory or exhortation in every moral treatise. It

is also present in books that try to teach an art, such as this one. Thus, in addition to trying to teach you to read better, we have tried, and will continue to try, to persuade you to make the effort to do so. Although every practical book is somewhat oratorical and hortatory, it does not follow that oratory and exhortation are coextensive with the practical. There is a difference between a political harangue and a treatise on politics, between economic propaganda and an analysis of economic problems. The Communist Manifesto is a piece of oratory, but Marx's *Capital* is much more than that. Sometimes you can detect that a book is practical by its title. If the title contains such phrases as "the art of " or "how to," you can spot it at once. If the title names fields that you know are practical, such as ethics or politics, engineering or business, and in many cases economics, law, or medicine, you can classify the book fairly readily. Titles can tell you even more than that. John Locke wrote two books with similar titles: *An Essay Concerning Human Understanding* and *A Treatise Concerning the Origin, Extent, and End of Civil Government*. Which of these is theoretical, which practical? From the titles alone we may conclude that the first is theoretical, because any analysis of understanding would be theoretical, and that the second is practical, because problems of government are themselves practical. But one could go beyond that, employing the techniques of inspectional reading that we have described. Locke wrote an introduction to the book on understanding. There he expressed his intention as being to inquire into the "origin, certainty, and extent of human knowledge." The phrasing resembles the title of the book on government, but with one important difference. Locke was concerned with the certainty or validity of knowledge in the one case, and with the end or purpose of government in the other. Questions about the validity of something are theoretical, whereas to raise questions about the end of anything, the purpose it serves, is practical. In describing the art of inspectional reading, we noted that you should not ordinarily stop after reading the front matter of a book and perhaps its index. You should read passages in the book that appear to be of a summary nature. You should also read the beginning and end of the book and of its major parts. This becomes necessary when, as is sometimes the case, it is impossible to classify a book from its title and other front matter. In that case, you have to depend on signs to be found in the main body of the text. By paying attention to the words and keeping the basic categories in mind, you should be able to classify a book without reading very far. A practical book will soon betray its character by the frequent occurrence of such words as "should" and "ought," "good" and "bad," "ends" and

“means.” The characteristic statement in a practical book is one that says that something should be done (or made); or that this is the right way of doing (or making) something; or that one thing is better than another as an end to be sought, or a means to be chosen. In contrast, a theoretical book keeps saying “is,” not “should” or “ought.” It tries to show that something is true, that these are the facts; not that things would be better if they were otherwise, and here is the way to make them better. Before turning to theoretical books, let us caution you against supposing that the problem is as simple as telling whether you are drinking coffee or milk. We have merely suggested some signs whereby you can begin to make discriminations. The better you understand everything that is involved in the distinction between the theoretical and the practical, the better you will be able to use the signs. For one thing, you will have to learn to mistrust them. You have to be suspicious in classifying books. We have noted that although economics is primarily and usually a practical matter, there are nevertheless books on economics that are purely theoretical. Similarly, although understanding is primarily and usually a theoretical matter, there are books (most of them are terrible) that purport to teach you “how to think.” You will also find authors who do not know the difference between theory and practice, just as there are novelists who do not know the difference between fiction and sociology. You will find books that are partly of one sort and partly of another, such as Spinoza’s *Ethics*. It remains, nevertheless, to your advantage as a reader to detect the way an author approaches his problem.

2. Kinds of Theoretical Books.

The traditional subdivision of theoretical books classifies them as history, science, and philosophy. Everybody knows the differences here in a rough way. It is only when you try to refine the obvious, and give the distinctions greater precision, that you get into difficulties. For the moment, let us try to skirt that danger and let rough approximations suffice. In the case of history, the title usually does the trick. If the word “history” does not appear in the title, the rest of the front matter is likely to inform us that this is a book about something that happened in the past—not necessarily in the far past, of course, because it may have happened only yesterday. The essence of history is narration. History is knowledge of particular events or things that not only existed in the past but also underwent a series of changes in the course of time. The historian narrates these happenings and often colors his narrative with comment on, or insight into, the significance of the events. History is chronotopic. Chronos is the Greek word for time, topos the Greek word for place. History always deals with things that existed or events that occurred on a particular date and in a particular place. The word “chronotopic” can remind you of that. Science is not concerned with the past as such. It treats of matters than can happen at any time or place. The scientist seeks laws or generalizations. He wants to find out how things happen for the most part or in every case, not, as the historian does, how some particular things happened at a given time and place in the past. The title of a scientific work is usually less revealing than the title of a history book. The word “science” sometimes appears, but more often the name of the subject matter appears, such as psychology or geology or physics. Then we must know whether that subject matter belongs to the scientist, as geology clearly does, or to the philosopher, as metaphysics clearly does. The trouble comes with the cases that are not so clear, such as physics and psychology, which have been claimed, at various times, by both scientists and philosophers. There is even trouble with the very words “philosophy” and “science,” for they have been variously used. Aristotle called his book on Physics a scientific treatise, although according to current usage we should regard it as philosophical; and Newton titled his great work Mathematical Principles of Natural Philosophy, though for us it is one of the masterpieces of science. Philosophy is like science and unlike history in that it seeks general truths rather than an account of particular events, either in the near or distant past. But the philosopher does not ask the same questions as the scientist, nor does he employ the same kind of method to answer them.

Since titles and subject-matter names are not likely to help us determine whether a book is philosophical or scientific, how can we tell? There is one criterion that we think always

works, although you may have to read a certain amount of the book before you can apply it. If a theoretical book emphasizes things that lie outside the scope of your normal, routine, daily experience, it is a scientific work. If not, it is philosophical. The distinction may be surprising. Let us illustrate it. (Remember that it applies only to books that are either science or philosophy, not to books that are neither.) Galileo's *Two New Sciences* requires you to imagine, or to repeat for yourself in a laboratory, certain experiments with inclined planes. Newton's *Opticks* refers to experiences in dark rooms with prisms, mirrors, and specially controlled rays of light. The special experience to which the author refers may not have been obtained by him in a laboratory. The facts that Darwin reported in *The Origin of Species* he observed in the course of many years of work in the field. They are facts that can be and have been rechecked by other observers making a similar effort. But they are not facts that can be checked in terms of the ordinary daily experience of the average man. In contrast, a philosophical book appeals to no facts or observations that lie outside the experience of the ordinary man. A philosopher refers the reader to his own normal and common experience for the verification or support of anything the writer has to say. Thus, Locke's *Essay Concerning Human Understanding* is a philosophical work in psychology, whereas many of Freud's writings are scientific. Locke makes every point in terms of the experience all of us have of our own mental processes. Freud can make many of his points only by reporting what he observed under the clinical conditions of the psychoanalyst's office. William James, another great psychologist, took an interesting middle course. He reports many examples of the special experience that only the careful, trained observer can know about, but he also frequently asks the reader to judge whether what is being said is not true from his own experience. Thus James' *Principles of Psychology* is both a scientific and a philosophical work, although it is primarily scientific. The distinction proposed here is popularly recognized when we say that science is experimental or depends upon elaborate observational researches, whereas philosophy is merely armchair thinking. The contrast should not be invidious. There are certain problems, some of them very important, that can be solved in an armchair by a man who knows how to think about them in the light of common, human experience. There are other problems that no amount of the best armchair thinking can solve. What is needed to solve them is investigation of some sort— experiments in the laboratory or research in the field—extending experience beyond the normal, everyday routine. Special experience is required. This does not mean that the philosopher is a pure thinker and the scientist merely an observer. Both have to observe and think, but they think about different sorts of observations. And however they may have arrived at the conclusions that they want to

prove, they prove them in different ways, the scientist by pointing to the results of his special experiences, the philosopher by pointing to experiences that are common to all. This difference in method always reveals itself in philosophical and scientific books, and that is how you can tell which sort of book you are reading. If you note the sort of experience that is being referred to as a condition of understanding what is being said, you will know whether the book is scientific or philosophical. It is important to know this because, apart from the different kinds of experiences that they depend on, scientists and philosophers do not think in exactly the same way. Their styles in arguing are different. You must be able to find the terms and propositions—here we are getting a little ahead of ourselves—that constitute these different sorts of argumentation. The same is true of history. Historical statements are different from scientific and philosophical ones. A historian argues differently and interprets facts differently. Furthermore, the typical history book is narrative in form. A narrative is a narrative, whether it be fact or fiction. The historian must write poetically, which means he must obey the rules for telling a good story. Whatever other excellences Locke's *Essay on Human Understanding* or Newton's *Principia* may have, neither is a good story. You may object that we are making too much of the classification of books, at least before one has read them. Is it really all that important?

We may be able to meet the objections by calling your attention to one obvious fact. If you walked into a classroom in which a teacher was lecturing or otherwise instructing students, you could tell very soon whether the class was one in history, science, or philosophy. There would be something in the way the teacher proceeded, the kind of words he used, the type of arguments he employed, the sort of problems he proposed, and the kind of responses he expected from his students, that would give him away as belonging to one department or another. And it would make a difference to you to know this, if you were going to try to listen intelligently to what went on. In short, the methods of teaching different kinds of subject matter are different. Any teacher knows this. Because of the difference in method and subject matter, the philosopher usually finds it easier to teach students who have not been previously taught by his colleagues, whereas the scientist prefers the student whom his colleagues have already prepared. And so forth and so on. Now, just as there is a difference in the art of teaching in different fields, so there is a reciprocal difference in the art of being taught. The activity of the student must somehow be responsive to the activity of the instructor. The relation between books and their readers is the same as that between teachers and their students. Hence, as books differ in the

kinds of knowledge they have to communicate, they proceed to instruct us differently; and, if we are to follow them, we must learn to read each kind in an appropriate manner.

3. Historical Books

“History,” like “poetry,” is a word of many meanings. In order for this chapter to be useful to you, we must come to terms with you about the word—that is, explain how we will be using it.

First of all, there is the difference between history as fact and history as a written record of the facts. We are obviously, here, employing the term in the latter sense, since in our sense of “read” you cannot read facts. But there are many kinds of written record that are called historical. A collection of documents pertaining to a certain event or period could be called a history of it. A transcription of an oral interview with a participant, or a collection of such transcriptions, could similarly be called a history of the event in which he or they participated. A work having quite a different intention, such as a personal diary or collection of letters, could be construed as being a history of the time. The word could be applied, and indeed has been applied, to almost every kind of writing that originated in a time period, or in the context of an event, in which the reader was interested. The sense in which we use the word “history” in what follows is both narrower and broader than any of those. It is narrower because we want to restrict ourselves to essentially narrative accounts, presented in a more or less formal manner, of a period or event or series of events in the past. This is a traditional use of the term, and we do not apologize for it. Again, as with our definition of lyric poetry, we think you will agree with us that this is the ordinary meaning of the term, and we want to stick to the ordinary here. But our meaning is also broader than many of the definitions of the term that are current today. We think, although not all historians agree with us, that the essence of history is narration, that the last five letters of the word—“story”—help us to understand the basic meaning. Even a collection of documents, as a collection, tells a story. That story may not be explicit—that is, the historian may try not to arrange the documents in any “meaningful” order. But it is implicit in them, whether they are ordered or not. Otherwise, we think, the collection would not be called a history of its time. It is not important, however, whether all historians agree with us in our notion of what history is. There is a great deal of history of the kind we are discussing, and you will want to or have to read at least some of it. We will try to aid you in that task.

The Elusiveness of Historical Facts

Probably you have been a member of a jury, listening to the testimony about a simple matter of fact, such as an automobile accident. Or you may have been on a blue ribbon jury, and have had to decide whether one person killed another or not. If you have done either, you know how difficult it is to reconstruct the past, even a single event in the past, from the memories of persons who actually saw it happen. A court concerns itself with events that have happened fairly recently and in the presence of living witnesses. In addition, there are stringent rules of evidence. A witness cannot suppose anything, he cannot guess or hypothecate or estimate (except under very carefully controlled conditions). And of course he is not supposed to lie. With all the careful rules of evidence, and cross-examination besides, have you ever been absolutely sure, as a member of a jury, that you really knew what happened? The law assumes that you will not be absolutely sure. It assumes that there will always be some doubt in a juror's mind. As a matter of practice, in order that trials may be decided one way or the other, it says that the doubt must be "reasonable" if it is to be allowed to affect your judgment. The doubt must be, in other words, sufficient to trouble your conscience. A historian is concerned with events that occurred, most of them, a long time ago. All the witnesses to the events are usually dead. What evidence they give is not given in a courtroom—that is, it is not governed by stringent and careful rules. Such witnesses as there are often guess, hypothecate, estimate, assume, and suppose. We cannot see their faces in order to judge whether they are lying (if we ever really can know that about anybody). They are not cross-examined. And there is no guarantee whatever that they know what they are talking about. If, then, it is difficult to be sure that one knows about the truth of a relatively simple matter, such as is decided by a jury in a court of law, how much more difficult it is to know what really happened in history. A historical fact, though we may have a feeling of trust and solidity about the word, is one of the most elusive things in the world. Of course, about some kinds of historical fact we can be pretty certain. America was involved in a Civil War that began with the firing on Fort Sumter, on April 12, 1861, and ended with the surrender of General Lee to General Grant at Appomattox Court House, on April 9, 1865. Everyone agrees about those dates. It is not likely (though it is not totally impossible) that every American calendar was incorrect at that time. But how much have we learned if we know exactly when the Civil War started and when it ended? Indeed, those dates have been disputed—not on the grounds that the calendars were wrong, but that the war really started with the election of Lincoln in the fall of 1860 and ended with his assassination five days after Lee's surrender. Others have claimed that the war started even earlier—as much as five or ten

or twenty years before 1861—and we know that it was still actually being fought in outlying parts of the United States, to which word had not yet come of the Northern triumph, as late as May, June, and July, 1865. And there are those, too, who feel that the Civil War is not over yet, that it will never be over until black Americans are completely free and equal, or until the South manages to secede from the Union, or until the right of the federal government to control all the states is finally established and accepted by every American everywhere. At least we do know, one might say, that whether or not the firing on Fort Sumter started the Civil War, it did occur on April 12, 1861. That is true—within the limits of possibility we referred to before. But why was Sumter fired on? That is an obvious next question. And could war still have been avoided after the attack? If it had been, would we care that such and such an assault occurred on such and such a spring day more than a century ago? If we did not care—and we do not care about many attacks on forts that have doubtless occurred, but about which we know nothing whatever—would the firing on Sumter still be a significant historical fact?

Theories of History

We class history, the story of the past, more often under fiction than under science— if it must be affiliated with one or the other. If not, if history, that is, is allowed to rest somewhere in between the two main divisions of the kinds of books, then it is usually admitted that history is closer to fiction than to science. This does not mean that a historian makes up his facts, like a poet or story teller. However, we might get into trouble if we insisted too strongly that a writer of fiction makes up his facts. He creates a world, as we have said. But this new world is not totally different from our own—indeed, it had better not be—and a poet is an ordinary man, with ordinary senses by and through which he has learned. He does not see things that we cannot see (he may see better or in a slightly different way). His characters use words that we use (otherwise we could not believe in them). It is only in dreams that human beings create really strange new worlds—yet even in the most fantastic dream the events and creatures of the imagination are made up out of elements of everyday experience. They are merely put together in strange new ways. A good historian does not, of course, make up the past. He considers himself responsibly bound by some concept or criterion of accuracy or facts. Nevertheless, it is important to remember that the historian must always make up something. He must either find a general pattern in, or impose one on, events; or he must suppose that he knows why the persons in his story did the things they did. He may have a general theory or philosophy, such as that Providence rules human affairs, and make his history fit that. Or he may

abjure any such pattern, imposed as it were from the outside or above, and instead insist that he is merely reporting the real events that have occurred. But in that case he is likely to be forced to assign causes for events and motivations for actions. It is essential to recognize which way the historian you are reading is operating. The only way to avoid taking either one or the other position is to assume that men do not do things for a purpose, or that the purpose, if it exists, is undiscoverable—in other words, that there is no pattern to history at all. Tolstoy had such a theory about history. He was not a historian, of course; he was a novelist. But many historians have held the same view, particularly in modern times. The causes of every human action, Tolstoy thought, were so manifold, so complex, and so deeply hidden in unconscious motivations that it is impossible to know why anything ever happened. Because theories of history differ, and because a historian's theory affects his account of events, it is necessary to read more than one account of the history of an event or period if we want to understand it. Indeed, this is the first rule of reading history. And it is all the more important if the event in which we are interested has practical significance for us. It is probably of practical significance to all Americans that they know something about the history of the Civil War. We still live in the backwash of that great and sorry conflict; we live in a world it helped to make. But we cannot hope to understand it if we look at it through the eyes of only one man, or one side, or one faction of modern academic historians. The other day we opened a new Civil War history and noted that its author offered it as "an impartial, objective history of the Civil War from the point of view of the South." The author appeared to be serious. Maybe he was; maybe such a thing is possible. At any rate, we would admit that every narrative history has to be written from some point of view. But to get at the truth, we ought to look at it from more than one viewpoint.

The Universal in History

We are not always able to read more than one history of an event. When we are not, we must admit that we do not have much chance of learning the truth of the matter in question—of learning what really happened. However, that is not the only reason to read history. It might be claimed that only the professional historian, the man who is writing a history himself, is required to cross-examine his sources by exhaustively checking one against the other. He must leave no stone unturned if he is to know what he ought to know about his subject. We, as lay readers of history, stand somewhere between the professional historian, on the one hand, and the irresponsible amateur, on the other hand, who reads history only for amusement. Let us take the example of Thucydides. You may be aware that he wrote the only major contemporary history of the Peloponnesian War at the end of the fifth century B.C. In a sense, there is nothing to check his work against. What, then, can we expect to learn from it? Greece is now a tiny country; a war that occurred there twenty-five centuries ago can have little real effect on our life today. Everyone who fought in it is long dead, and the specific things for which they fought are long dead, too. The victories are now meaningless, and the defeats without pain. The cities that were taken and lost have crumbled into dust. Indeed, if we stop to think of it, almost all that remains of the Peloponnesian War is Thucydides' account of it. Yet that account is still important. For Thucydides' story—we might as well use that word—has had an influence on the subsequent history of man. Leaders in later eras read Thucydides. When they found themselves in situations that even faintly approximated that of the tragically divided Greek city-states, they compared their own position to that of Athens or Sparta. They used Thucydides as an excuse and a justification, and even as a pattern of conduct. The result was that by ever so little, perhaps, but perceptibly, the history of the world was changed by the view held of a small portion of it by Thucydides in the fifth century B.C. Thus we read Thucydides not because he described perfectly what happened before he wrote his book, but because he to a certain extent determined what happened after. And we read him, strange as this may seem, to know what is happening now. "Poetry is more philosophical than history," wrote Aristotle. By this he meant that poetry is more general, more universal. A good poem is true not only in its own time and place, but in all times and places. It has meaning and force for all men. History is not quite so universal as that. It is tied to events in a way that poetry is not. But any good history is also universal. Thucydides himself said that he was writing his history so that men of the future would not have to repeat the mistakes he had seen made and from which he had suffered personally and through the agony of his country. He described the kinds of human mistakes that would have meaning

to men other than himself, to men other than Greeks. Yet some of the very same errors that the Athenians and the Spartans made 2,500 years ago, or at least very similar ones, are being made now, as they have been made over and over again since Thucydides' time. If your view of history is limited, if you go to it to discover only what really happened, you will not learn the main thing that Thucydides, or indeed any good historian, has to teach. If you read Thucydides well, you may even decide to give up trying to discover what really happened in the past.

History is the story of what led up to now. It is the present that interests us—that and the future. The future will be partly determined by the present. Thus, you can learn something about the future, too, from a historian, even from one who like Thucydides lived more than two thousand years ago. Let us sum up these two suggestions for reading history. The first is: if you can, read more than one history of an event or period that interests you. The second is: read a history not only to learn what really happened at a particular time and place in the past, but also to learn the way men act in all times and places, especially now.

4. Biography.

A biography is a story about a real person. This mixed patrimony causes it to have a mixed character.

Some biographers would object to this description. But ordinarily, at least, a biography is a narrative account of the life, the history, of a man or woman or of a group of people; thus, a biography poses many of the same problems as a history. The reader must ask the same sort of questions—what is the author's purpose? What are his criteria of truth?—as well, of course, as asking the questions we must ask of any book.

There are several kinds of biographies. The *definitive* biography is intended to be the final, exhaustive, scholarly work on the life of someone important enough to deserve a definitive biography. Definitive biographies cannot be written about living persons. They are seldom written until several non-definitive biographies have first appeared, all of them often somewhat inadequate. All sources are gone through, all letters read, and a great deal of contemporary history examined by the author. Since the ability to gather the materials is somewhat different from the talent for shaping them into a good book, definitive biographies are not always easy reading. This is too bad. A scholarly book does not have to be dull. One of the greatest of all biographies is Boswell's *Life of Johnson*, and it is continuously fascinating. It is certainly definitive (though other biographies of Dr. Johnson have since appeared), but it is also uniquely interesting.

A definitive biography is a slice of history—the history of a man and of his times, as seen through his eyes. It should be read as history. An *authorised* biography is not the same thing at all. Such works are usually commissioned by the heirs or friends of some important person, and they are carefully written so that the errors the person made and the triumphs he achieved are seen in the best light possible. They can sometimes be very good indeed, because the author has the advantage—not as a rule accorded to other writers—of being allowed access to all pertinent material by those who control it. But, of course, an authorised biography cannot be trusted in the same way that a definitive biography can be. Instead of reading it simply as history, the reader should understand that it may be biased—that this is the way the reader is expected to think of the book's subject; this is the way his friends and associates want him to be known to the world.

The authorised biography is a kind of history, but it is history with a difference. We may be curious to know what interested persons want the public to know about someone's private life, but we should not expect to know what the private life really was. The reading of an authorised biography will thus often tell us much about the time in which it was written, about its customs and manners, about those actions and attitudes that were acceptable—and, by implication and with a little extrapolation, about those that were not. But we should not hope to discover the real life of a human being any more than we would hope to know the real story of a war if we read the communiqués of only one side. To get at the truth we must read all the communiqués, ask people who were there, and use our own minds to make sense out of the muddle. A definitive biography has already done this work; in the case of an authorised biography (and most biographies of living persons are of this sort), there is still much to do.

There remain those biographies that are neither definitive nor authorised. Perhaps we may call them ordinary biographies. In such works, we expect the author to be accurate, to know his facts. We want above all to be given the feeling that we are viewing the life of a real person in another time and place. Human beings are curious, and especially curious about other human beings.

Such books, although not trustworthy in the way definitive biographies are, are often very good reading. The world would be the poorer without Izaak Walton's *Lives* of his friends, the poets John Donne and George Herbert, for example (Walton is of course better known for his *The Compleat Angler*); or John Tyndall's account of his friend Michael Faraday in *Faraday the Discoverer*.

Some biographies are didactic. They have a moral purpose. Not many of this sort are written any more, but they used to be common. (They are still written for children, of course.) Plutarch's *Lives of the Noble Grecians and Romans* is such a work. Plutarch told the stories of great men of the Greek and Roman past in order to help his contemporaries to be great also, and to help them avoid the errors into which the great so often fall—or so he felt. The *Lives* is a marvellous book; but, although many of the accounts are the only ones we have of their subjects, we do not read it so much for its biographical information as for its view of life in general. Its subjects are interesting people, good and bad, but never indifferent. Plutarch realised this himself. His original intention in writing had been to instruct others, he said, but in the course of the work he discovered that more and more it was he himself who was deriving profit and stimulation from “lodging these men one after the other in his house.”

Incidentally, Plutarch's is another historical work that has exercised a profound influence on subsequent history. For example, just as Plutarch shows Alexander the Great modelling his own life on that of Achilles (whose life he learned about from Homer), so many later conquerors have tried to model their lives on that of Plutarch's Alexander.

5. Autobiography

Autobiographies present some different and interesting problems. First of all, it is questionable whether anyone has ever written a true autobiography. If it is difficult to know the life of anyone else, it is even more difficult to know one's own. And, of course, all autobiographies have to be written about lives that are not yet complete.

The temptation to tell either less or more than the truth (the latter may be more common), when there is no one to contradict you, is almost irresistible. Everybody has some secrets he cannot bear to divulge; everybody also has some illusions about himself, which it is almost impossible for him to regard as illusions. However, although it is not possible to write a wholly true autobiography, neither is it possible to write one that contains no truth at all. Just as no man can be a perfect liar, so every autobiography tells us something about its author, if only that there are things that he wants to conceal.

It is customary to say that the *Confessions* of Rousseau, or some other book written about the same time (about the middle of the eighteenth century), is the first real autobiography. This is to overlook Augustine's *Confessions*, for example, and Montaigne's *Essays*; but the error is more serious than that. In fact, much of what anyone writes on any subject is autobiographical. There is a great deal of Plato in the *Republic*, of Milton in *Paradise Lost*, of Goethe in *Faust*—though we may not be able to put our finger on it exactly. If we are interested in humanity, we will tend, within reasonable limits, to read any book partly with an eye to discovering the character of its author.

This should never be the primary consideration, and it leads, when it is overdone, to the so-called pathetic fallacy. But we should remember that words do not write themselves—the ones we read have been found and written down by a living man. Plato and Aristotle said some similar, and some dissimilar, things; but even if they had agreed completely, they could not have written the same books, for they were different men. We may even discover something of St. Thomas Aquinas in such an apparently unrevealing work as the *Summa Theologica*.

Thus it matters very little that *formal* autobiography is a relatively new literary genre. No one has ever been able to keep himself entirely out of his book. "I have no more made my book," said Montaigne, "than my book has made me; a book co-substantial with its author, concerned with my own self, an integral part of my life." And he added, "Everyone recognizes me in my book, and my book in me." This is true, and not only of Montaigne. "This is no book," says Whitman of his *Leaves of Grass*. "Who touches this touches a man."

Are there any additional hints for reading biographies and autobiographies? Here is one that is important. Despite the fact that such books, and especially the autobiographies, reveal much about their authors, we should not spend so much time trying to discover a writer's secrets that we do not find out what he says plainly. Apart from this, given the fact that such books are often more poetical than discursive or philosophical, and that they are special kinds of history, there is perhaps little more to add. You should remember, of course, that if you wish to know the truth about a person's life, you should read as many

biographies of him as you can find, including his own account of his life, if he wrote one. Read biography as history and as the cause of history; take all autobiographies with a grain of salt; and never forget that you must not argue with a book until you fully understand what it is saying. As to the question, What of it?, we would only say this: biography, like history, can be a cause of practical, moral action. A biography can be inspiring. It is the story of a life, usually a more or less successful one—and we too have lives to lead.

6. Current Events

We have said that our exposition of the art of analytical reading applies to everything you have to read, not just to books. Now we want to qualify that statement a little. Analytical reading is not always necessary. There are many things that we read that do not require the kind of effort and skill that is called for at this third level of reading ability. Nevertheless, although the rules of reading do not all always have to be applied, the four questions must always be asked of anything you read. That means, of course, that they must be asked when you are faced with the kind of things to which most of us devote much of our reading time: newspapers, magazines, books about current events, and the like.

After all, history did not stop a thousand years ago, or a hundred. The world goes on, and men and women continue to write about what is happening and how things are changing. Perhaps no modern history is as great as Thucydides' work; posterity will have to be the judge of that. But we do have an obligation, as human beings and as citizens, to try to understand the world around us.

The problem comes down to knowing what is actually happening now. We have chosen the word "actually" in the last sentence intentionally. The French word for newsreel is *actualités*; the whole concept of current events literature is somehow the same as that of the "news." How do we get the news, and how do we know that what we get is true?

You can see at once that we are faced with the same problem that is posed by history itself. We cannot be sure that we are getting at the facts—we cannot be sure that we know what is happening now any more than we can be sure about what happened in the past. And yet we must try to know, so far as that is possible.

If we could be everywhere at once, overhear all conversations on earth, look into the heart of every living person, we might be able to make a stab at the truth of current events. Being human and hence limited, we must fall back on the services of reporters. Reporters are persons who are supposed to know what is happening in a small area. They report it in newspaper stories, in magazines, or in books. What we can know depends on them.

Ideally, a reporter, of whatever kind, is a clear glass in which reality is reflected—or through which it shines. But the human mind is not a clear glass. It is not a good reflector, and when reality shines through it, the mind is not a very good filter. It separates out what it considers to be unreality, untruth. That is proper, of course; a reporter should not report what he thinks is false. But he may be mistaken.

Thus the most important thing to know, when reading any report of current happenings, is *who is writing the report*. What is involved here is not so much an acquaintance with the reporter himself as with the *kind* of mind he has. The various sorts of filter-reporters fall into groups. To understand what kind of filter our reporter's mind is, we must ask a series of questions about it. This amounts to asking a series of questions about any material dealing with current events. The questions are these:

1. What does the author want to prove?
2. Whom does he want to convince?
3. What special knowledge does he assume?
4. What special language does he use?
5. Does he really know what he is talking about?

For the most part it is safe to assume that all current events books want to prove something. Often it is easy enough to discover what this is. The blurb often states the main contention or thesis of such books. If it does not appear there, it may be stated by the author in a preface.

Having asked what the book is trying to prove, you should next ask whom the author is trying to convince. Is the book intended for those “in the know”—and are you in that category? Is it for that small group of persons who can do something, and quickly, about the situation the author describes? Or is it for everyone? If you do not belong to the audience for which the book is intended, you may not want to read it.

You must next discover what special knowledge the author assumes that you have. The word “knowledge” is intended here to cover a lot of ground. “Opinion” or “prejudice” might have been a better choice. Many authors write only for readers who agree with them. If you disagree sharply with a reporter’s assumptions, you may only be irritated if you try to read his book.

The assumptions that an author makes, and that he assumes you share, are sometimes very difficult to discover. In *The Seventeenth Century Background*, Basil Willey has this to say:

. . . it is almost insuperably difficult to become critically conscious of one’s own habitual assumptions; “doctrines felt as facts” can only be seen to be doctrines, and not facts, after great efforts of thought, and usually only with the aid of a first-rate metaphysician.

He goes on to suggest that it is easier to discover the “doctrines felt as facts” of an age different from our own, and that is what he attempts to do in his book. In reading books about our own time, however, we do not have the advantage of distance. Thus we must try to see through the filter not only of the author-reporter’s mind, but also of our own.

Next, you must ask if there is a special language that the author uses. This is particularly important in reading magazines and newspapers, but it also applies to all books about current history. Certain words provoke special responses from us, responses that they might not provoke from other readers a century hence. An example of such a word is “Communism” or “Communist.” We should try to control these responses, or at least know when they occur.

Finally, you must consider the last of the five questions, which is probably the hardest to answer. Does the reporter whose work you are reading himself know the facts? Is he privy to the perhaps secret thoughts and decisions of the persons about whom he is writing? Does he know all that he should know in order to give a fair and balanced account of the situation?

What we are suggesting, in other words, is that the possible bias of the author-reporter is not the only thing that has to be considered. We have heard a good deal lately about the “management of the news”; it is important to realize that this applies not only to us, as members of the public, but also to reporters who are supposed to be “in the know.” They may not be. With the best good will in the world, with every intention of providing us with the truth of the matter, a reporter may still be “uninformed” with regard to secret actions, treaties, and so forth. He himself may be aware of this, or he may not. In the latter case, of course, the situation is especially perilous for his reader.

You will note that these five questions are really only variations on the questions we have said you must ask of any expository book. Knowing an author’s special language, for example, is nothing more than coming to terms with him. But because current books and other material about the contemporary world pose special problems for us as readers, we have stated the questions in a different way.

Perhaps it is most useful to sum up the difference in a warning rather than a set of rules for reading books of this kind. The warning is this: *Caveat lector*—“Let the reader beware.” Readers do not have to be wary when reading Aristotle, or Dante, or Shakespeare. But the author of any contemporary book may have—though he does not necessarily have—an interest in your understanding it in a certain way. Or if he does not, the sources of his information may have such an interest. You should know that interest, and take it into account in whatever you read.

A Note on Digests

There is another consequence of our basic distinction—the distinction between reading for information and reading for understanding—that underlies everything we have said about reading. And this is that sometimes we have to read for information about understanding—to find out how others have interpreted the facts. Let us try to explain what this means.

For the most part, we read newspapers and magazines, and even advertising matter, for the information they contain. The amount of such material is vast, so vast that no one today has time to read more than a small fraction of it. Necessity has been the mother of a number of good inventions in the field of such reading. The news magazines, for instance, such as *Time* and *Newsweek*, perform an invaluable function for most of us by *reading* the news and reducing it to its essential elements of information. The men who write these magazines are primarily readers. They have developed the art of reading for information to a point far beyond the average reader's competence.

The same is true of a publication like *Reader's Digest*, which professes to bring us in condensed form much that is worth our attention in current general magazines to the compact scope of a single, small volume. Of course, the very best articles, like the best books, cannot be condensed without loss. If the essays of Montaigne, for example, were appearing in a current periodical, we would scarcely be satisfied to read a digest of them. A summary, in this case, would function well only if it impelled us to read the original. For the average article, however, a condensation is usually adequate, and often even better than the original, because the average article is mainly informational. The skill that produces *Reader's Digest* and the scores of similar periodicals is, first of all, a skill in reading, and only then one of writing simply and clearly. It does for us what few of us have the technique—even if we had the time—to do for ourselves. It cuts the core of solid information out of pages and pages of less substantial stuff.

But, after all, we still have to read the periodicals that accomplish these digests of current news and information. If we wish to be informed, we cannot avoid the task of reading, no matter how good the digests are. And the task of reading them is, in the last analysis, the same task as that which is performed by the editors of these magazines on the original material that they make available in more compact form. They have saved us labor, so far as the extent of our reading is concerned, but they have not saved us and cannot entirely save us the trouble of reading. In a sense, the function they perform profits us only if we can read their digests of information as well as they have done the prior reading in order to give us the digests.

And that involves reading for understanding as well as information. Obviously, the more condensed a digest is, the more selection has occurred. We may not have to worry about this very much if 1,000 pages are cut down to 900, say; but if 1,000 pages are cut to ten, or even one, then the question of what has been left out becomes critical. Hence the greater the condensation, the more important it is that we know something of the character of the condenser; the same *caveat* we mentioned before applies here with even greater force. Ultimately, perhaps, this comes down to reading between the lines of an expert

condensation. You cannot refer to the original to find out what was left out; you must somehow infer this from the condensation itself. Reading digests, therefore, is sometimes the most demanding and difficult reading that you can do.

7. Science and Mathematics

The title of this chapter may be misleading. We do not propose to give you advice about how to read every kind of science and mathematics. We will confine ourselves to discussing only two kinds: the great scientific and mathematical classics of our tradition, on the one hand, and modern scientific popularisation, on the other hand. What we say will often be applicable to the reading of specialised monographs on abstruse and limited subjects, but we cannot help you to read those. There are two reasons for this. One is, simply, that we are not qualified to do it.

The other is this. Until approximately the end of the nineteenth century, the major scientific books were written for a lay audience. Their authors—men like Galileo, and Newton, and Darwin—were not averse to being read by specialists in their fields; indeed, they wanted to reach such readers. But there was as yet no institutionalised specialisation in those days, days which Albert Einstein called “the happy childhood of science.” Intelligent and well-read persons were expected to read scientific books as well as history and philosophy; there were no hard and fast distinctions, no boundaries that could not be crossed. There was also none of the disregard for the general or lay reader that is manifest in contemporary scientific writing. Most modern scientists do not care what lay readers think, and so they do not even try to reach them.

Today, science tends to be written by experts for experts. A serious communication on a scientific subject assumes so much specialised knowledge on the part of the reader that it usually cannot be read at all by anyone not learned in the field. There are obvious advantages to this approach, not least that it serves to advance science more quickly. Experts talking to each other about their expertise can arrive very quickly at the frontiers of it—they can see the problems at once and begin to try to solve them. But the cost is equally obvious. You—the ordinary intelligent reader whom we are addressing in this book—are left quite out of the picture.

In fact, this situation, although it is more extreme in science than elsewhere, obtains in many other fields as well. Nowadays, philosophers seldom write for anyone except other philosophers; economists write for economists; and even historians are beginning to find that the kind of shorthand, monographic communication to other experts that has long been dominant in science is a more convenient way of getting ideas across than the more traditional narrative work written for everyone.

What does the general reader do in these circumstances? He cannot become expert in all fields. He must fall back, therefore, on scientific popularisation. Some of these are good, and some are bad. But it is not only important to know the difference; it is also important to be able to read the good ones with understanding.

Understanding the Scientific Enterprise

One of the fastest growing academic disciplines is the history of science. We have seen marked changes in this area within the past few years. It was not so long ago that “serious” scientists looked down upon historians of science. The latter were thought of as men who studied the history of a subject because they were not capable of expanding its frontiers. The attitude of scientists to historians of science could be summed up in that famous remark of George Bernard Shaw’s: “Those who can, do; those who can’t, teach.”

Expressions of this attitude are seldom heard nowadays. Departments of the history of science have become respectable, and excellent scientists study and write about the history of their subject. An example is what has been called the “Newton industry.” At the present time, intensive and extensive research is being undertaken in many countries on the work and strange personality of Sir Isaac Newton. Half a dozen books have been recently published or announced. The reason is that scientists are more concerned than ever before about the nature of the scientific enterprise itself.

Thus we have no hesitation in recommending that you try to read at least some of the great scientific classics of our tradition. In fact, there is really no excuse for not *trying* to read them. None of them is impossibly difficult, not even a book like Newton’s *Mathematical Principles of Natural Philosophy*, if you are willing to make the effort.

The most helpful advice we can give you is this. You are required by one of the rules for reading expository works to state, as clearly as you can, the problem that the author has tried to solve. This rule of analytical reading is relevant to all expository works, but *it is particularly relevant to works in the fields of science and mathematics*.

There is another way of saying this. As a layman, you do not read the classical scientific books to become knowledgeable in their subject matters in a contemporary sense. Instead, you read them to understand the history and philosophy of science. That, indeed, is the layman’s responsibility with regard to science. The major way in which you can discharge it is to become aware of the problems that the great scientists were trying to solve—aware of the problems, and aware, also, of the background of the problems.

To follow the strands of scientific development, to trace the ways in which facts, assumptions, principles, and proofs are interrelated, is to engage in the activity of the human reason where it has probably operated with the most success. That is enough by itself, perhaps, to justify the historical study of science. In addition, such study will serve to dispel, in some measure, the apparent unintelligibility of science. Most important of all, it is an activity of the mind that is essential to education, the central aim of which has always been recognized, from Socrates’ day down to our own, as the freeing of the mind through the discipline of wonder.

Suggestions for Reading Classical Scientific Books

By a scientific book, we mean the report of findings or conclusions in some field of research, whether carried on experimentally in a laboratory or by observations of nature in the raw. The scientific problem is always to describe the phenomena as accurately as possible, and to trace the interconnections between different kinds of phenomena.

In the great works of science, there is no oratory or propaganda, though there may be bias in the sense of initial presuppositions. You detect this, and take account of it, by distinguishing what the author *assumes* from what he *establishes* through argument. The more “objective” a scientific author is, the more he will explicitly ask you to take this or that for granted. Scientific objectivity is not the *absence of initial bias*. It is attained by *frank confession of it*.

The leading terms in a scientific work are usually expressed by uncommon or technical words. They are relatively easy to spot, and through them you can readily grasp the propositions. The main propositions are always general ones. Science thus is not chronotopic. Just the opposite; a scientist, unlike a historian, tries to get away from locality in time and place. He tries to say how things are generally, how things generally behave.

There are likely to be two main difficulties in reading a scientific book. One is with respect to the arguments. Science is primarily inductive; that is, its primary arguments are those that establish a general proposition by reference to observable evidence—a single case created by an experiment, or a vast array of cases collected by patient investigation. There are other arguments, of the sort that are called deductive. These are arguments in which a proposition is proved by other propositions already somehow established. So far as proof is concerned, science does not differ much from philosophy. But the inductive argument is characteristic of science.

This first difficulty arises because, in order to understand the inductive arguments in a scientific book, you must be able to follow the evidence that the scientist reports as their basis. Unfortunately, this is not always possible with nothing but the book in hand. If the book itself fails to enlighten him, the reader has only one recourse, which is to get the necessary special experience for himself at first hand. He may have to witness a laboratory demonstration. He may have to look at and handle pieces of apparatus similar to those referred to in the book. He may have to go to a museum and observe specimens or models.

Anyone who desires to acquire an understanding of the history of science must not only read the classical texts, but must also become acquainted, through direct experience, with the crucial experiments in that history. There are classical experiments as well as classical books. The scientific classics become more intelligible to those who have seen with their own eyes and done with their own hands what a great scientist describes as the procedure by which he reached his insights.

This does not mean that you cannot make a start without going through all the steps described. Take a book like Lavoisier’s *Elements of Chemistry*, for instance. Published in

1789, the work is no longer considered to be useful as a textbook in chemistry, and indeed a student would be unwise to study it for the purpose of passing even a high school examination in the subject. Nevertheless, its method was revolutionary at the time, and its conception of a chemical element is still, on the whole, the one that we have in modern times. Now the point is that you do not have to read the book through, and in detail, to receive these impressions of it. The Preface, for example, with its emphasis on the importance of method in science, is enlightening. "Every branch of physical science," wrote Lavoisier, must consist of three things: the series of facts which are the objects of the science, the ideas which represent these facts, and the words by which these facts are expressed. . . . And, as ideas are preserved and communicated by means of words, it necessarily follows that we cannot improve the language of any science without at the same time improving the science itself; neither can we, on the other hand, improve a science without improving the language or nomenclature which belongs to it.

This was exactly what Lavoisier did. He improved chemistry by improving its language, just as Newton, a century before, had improved physics by systematizing and ordering *its* language—in the process, as you may recall, developing the differential and integral calculus.

Mention of the calculus leads us to consider the second main difficulty in reading scientific books. And that is the problem of mathematics.

Facing the Problem of Mathematics

Many people are frightened of mathematics and think they cannot read it at all. No one is quite sure why this is so. Some psychologists think there is such a thing as "symbol blindness"—the inability to set aside one's dependence on the concrete and to follow the controlled shifting of symbols. There may be something to this, except, of course, that words shift, too, and their shifts, being more or less uncontrolled, are perhaps even more difficult to follow. Others believe that the trouble lies in the teaching of mathematics. If so, we can be gratified that much recent research has been devoted to the question of how to teach it better.

The problem is partly this. We are not told, or not told early enough so that it sinks in, that mathematics is a language, and that we can learn it like any other, including our own. We have to learn our own language twice, first when we learn to speak it, second when we learn to read it. Fortunately, mathematics has to be learned only once, since it is almost wholly a written language.

As we have already observed, learning a new written language always involves us in problems of elementary reading. When we underwent our initial reading instruction in elementary school, our problem was to learn to recognize certain arbitrary symbols when they appeared on a page, and to memorize certain relations among these symbols. Even the best readers continue to read, at least occasionally, at the elementary level: for example, whenever we come upon a word that we do not know and have to look up in the dictionary. If we are puzzled by the syntax of a sentence, we are also working at the

elementary level. Only when we have solved these problems can we go on to read at higher levels.

Since mathematics is a language, it has its own vocabulary, grammar, and syntax, and these have to be learned by the beginning reader. Certain symbols and relationships between symbols have to be memorized. The problem is different, because the language is different, but it is no more difficult, *theoretically*, than learning to read English or French or German. At the elementary level, in fact, it may even be easier.

Any language is a medium of communication among men on subjects that the communicants can mutually comprehend. The subjects of ordinary discourse are mainly emotional facts and relations. Such subjects are not *entirely* comprehensible by any two different persons. But two different persons *can* comprehend a third thing that is outside of and emotionally separated from both of them, such as an electrical circuit, an isosceles triangle, or a syllogism. It is mainly when we invest these things with emotional connotations that we have trouble understanding them. Mathematics allows us to avoid this. There are no emotional connotations of mathematical terms, propositions, and equations when these are properly used.

We are also not told, at least not early enough, how beautiful and how intellectually satisfying mathematics can be. It is probably not too late for anyone to see this if he will go to a little trouble. You might start with Euclid, whose *Elements of Geometry* is one of the most lucid and beautiful works of any kind that has ever been written.

Let us consider, for example, the first five propositions in Book I of the *Elements*. (If a copy of the book is available, you should look at it.) Propositions in elementary geometry are of two kinds: (1) the statement of problems in the construction of figures, and (2) theorems about the relations between figures or their parts. Construction problems require that something be done, theorems require that something be proved. At the end of a Euclidean construction problem, you will find the letters Q.E.F., which stand for *Quod erat faciendum*, "(Being) what it was required to do." At the end of a Euclidean theorem, you will find the letters Q.E.D., which stand for *Quod erat demonstrandum*, "(Being) what it was required to prove."

The first three propositions in Book I of the *Elements* are all problems of construction. Why is this? One answer is that the constructions are needed in the proofs of the theorems. This is not apparent in the first four propositions, but we can see it in the fifth proposition, which is a theorem. It states that in an isosceles triangle (a triangle with two equal sides) the base angles are equal. This involves the use of Proposition 3, for a shorter line is cut off from a longer line. Since Proposition 3, in turn, depends on the use of the construction in Proposition 2, while Proposition 2 involves Proposition 1, we see that these three constructions are needed for the sake of Proposition 5.

Constructions can also be interpreted as serving another purpose. They bear an obvious similarity to postulates; both constructions and postulates assert that geometrical operations can be performed. In the case of the postulates, the possibility is *assumed*; in the case of the propositions, it is *proved*. The proof, of course, involves the use of the

postulates. Thus, we might wonder, for example, whether there is really any such thing as an equilateral triangle, which is defined in Definition 20. Without troubling ourselves here about the thorny question of the existence of mathematical objects, we can at least see that Proposition 1 shows that, from the *assumption* that there are such things as straight lines and circles, it *follows* that there are such things as equilateral triangles.

Let us return to Proposition 5, the theorem about the equality of the base angles of an isosceles triangle. When the conclusion has been reached, in a series of steps involving reference to previous propositions and to the postulates, the proposition has been proved. It has then been shown that *if something is true* (namely, the hypothesis that we have an isosceles triangle), and if some additional things are valid (the definitions, postulates, and prior propositions), *then something else is also true*, namely, the conclusion. The proposition asserts this *if-then* relationship. It does not assert the truth of the hypothesis, nor does it assert the truth of the conclusion, except when the hypothesis is true. Nor is this connection between hypothesis and conclusion seen to be true until the proposition is proved. It is precisely the truth of this connection that is proved, and nothing else.

Is it an exaggeration to say that this is beautiful? We do not think so. What we have here is a *really logical exposition* of a *really limited problem*. There is something very attractive about both the clarity of the exposition and the limited nature of the problem. Ordinary discourse, even very good philosophical discourse, finds it difficult to limit its problems in this way. And the use of logic in the case of philosophical problems is hardly ever as clear as this.

Consider the difference between the argument of Proposition 5, as outlined here, and even the simplest of syllogisms, such as the following:

All animals are mortal;
All men are animals;
Therefore, all men are mortal.

There is something satisfying about that, too. We can treat it as though it were a piece of mathematical reasoning. Assuming that there are such things as animals and men, and that animals are mortal, then the conclusion follows with the same certainty as the one about the angles of the triangle. But the trouble is that there really are animals and men; we are assuming something about real things, something that may or may not be true. We have to examine our assumptions in a way that we do not have to do in mathematics. Euclid's proposition does not suffer from this. It does not really matter to him whether there are such things as isosceles triangles. *If* there are, he is saying, and *if* they are defined in such and such a way, *then* it follows absolutely that their base angles are equal. There can be no doubt about this whatever—now and forever.

Handling the Mathematics in Scientific Books

This digression on Euclid has led us a little out of our way. We were observing that the presence of mathematics in scientific books is one of the main obstacles to reading them. There are a couple of things to say about that.

First, you can probably read at least elementary mathematics better than you think. We have already suggested that you should begin with Euclid, and we are confident that if you spent several evenings with the *Elements* you would overcome much of your fear of the subject. Having done some work on Euclid, you might proceed to glance at the works of other classical Greek mathematicians— Archimedes, Apollonius, Nicomachus. They are not really very difficult, and besides, you can skip.

That leads to the second point we want to make. If your intention is to read *a mathematical book in and for itself*, you must read it, of course, from beginning to end—and with a pencil in your hand, for writing in the margins and even on a scratch pad is more necessary here than in the case of any other kinds of books. But your intention may not be that, but instead to read *a scientific work that has mathematics in it*. In this case, skipping is often the better part of valor.

Take Newton's *Principia* for an example. The book contains many propositions, both construction problems and theorems, but it is not necessary to read all of them in detail, especially the first time through. Read the statement of the proposition, and glance down the proof to get an idea of how it is done; read the statements of the so-called lemmas and corollaries; and read the so-called scholiums, which are essentially discussions of the relations between propositions and of their relations to the work as a whole. You will begin to see that whole if you do this, and so to discover how the system that Newton is constructing is built—what comes first and what second, and how the parts fit together. Go through the whole work in this way, avoiding the diagrams if they trouble you (as they do many readers), merely glancing at much of the interstitial matter, but being sure to find and read the passages where Newton is making his main points. One of these comes at the very end of the work, at the close of Book III, which is titled "The System of the World." This *General Scholium*, as Newton called it, not only sums up what has gone before but also states the great problem of almost all subsequent physics.

Newton's *Optics* is another scientific classic that you might want to try to read. There is actually very little mathematics in it, although at first glance that does not appear to be so because the pages are sprinkled with diagrams. But these diagrams are merely illustrations describing Newton's experiments with holes for the sun to shine through into a dark room, with prisms to intercept the sunbeam, and with pieces of white paper placed so that the various colors of the beam can shine on them. You can quite easily repeat some of these experiments yourself, and this is fun to do, for the colors are beautiful, and the descriptions are eminently clear. You will want to read, in addition to the descriptions of the experiments, the statements of the various theorems or propositions, and the discussions that occur at the end of each of the three Books, where Newton sums up his discoveries

and suggests their consequences. The end of Book III is famous, for it contains some statements by Newton about the scientific enterprise itself that are well worth reading.

Mathematics is very often employed by scientific writers, mainly because it has the qualities of preciseness, clarity, and limitedness that we have described. Usually you can understand something of the matter without going very deeply into the mathematics, as in the case of Newton. Oddly enough, however, even if mathematics is absolutely terrifying to you, its absence from certain works may cause you even more trouble. A case in point is Galileo's *Two New Sciences*, his famous treatise on the strength of materials and on motion. This work is particularly difficult for modern readers because it is *not* primarily mathematical; instead, it is presented in the form of a dialogue. The dialogue form, though appropriate to the stage and useful in philosophy when employed by such a master as Plato, is not really appropriate to science. It is therefore hard to discover what Galileo is saying, although when you do you will discover that he is stating some revolutionary things.

Not all of the scientific classics, of course, employ mathematics or even need to employ it. The works of Hippocrates, the founder of Greek medicine, are not mathematical. You might well read them to discover Hippocrates' view of medicine —namely, that it is the art of keeping people well, rather than that of curing them when they are sick. That is unfortunately an uncommon idea nowadays. Nor is William Harvey's discourse on the circulation of the blood mathematical, or William Gilbert's book on magnets. They can be read without too much difficulty if you always keep in mind that your primary obligation is *not to become competent in the subject matter but instead to understand the problem*.

A Note on Popular Science

In a sense, there is little more to say about reading scientific popularisation. By definition, these are works—either books or articles—written for a wide audience, not just for specialists. Thus, if you have managed to read some of the classics of the scientific tradition, you should not have much trouble with them. This is because, although they are about science, they generally skirt or avoid the two main problems that confront the reader of an original contribution in science. First, *they contain relatively few descriptions of experiments* (instead, they merely report the results of experiments). Second, *they contain relatively little mathematics* (unless they are popular books about mathematics itself).

Popular scientific articles are usually easier to read than popular scientific books, although not always. Sometimes such articles are very good—for example, articles found in *Scientific American*, a monthly magazine, or *Science*, a somewhat more technical weekly publication. Of course, these publications, no matter how good they are or how carefully and responsibly edited, pose the problem that was discussed at the end of the last chapter. In reading them, we are at the mercy of reporters who filter the information for us. If they are good reporters, we are fortunate. If they are not, we have almost no recourse.

Scientific popularisation are never easy reading in the sense that a story is or seems to be. Even a three-page article on DNA containing no reports of experiments and no diagrams or mathematical formulas demands considerable effort on the part of the reader. You cannot read it for understanding without keeping your mind awake. Thus, the requirement that you read actively is more important here than almost anywhere else. Identify the subject matter. Discover the relation between the whole and its parts. Come to terms and plot the propositions and arguments. Work at achieving understanding before you begin to criticize or to assess significance.

These rules, by now, are all familiar. But they apply here with particular force.

Short articles are usually primarily informational, and as such they require less active thinking on your part. You must make an effort to understand, to follow the account provided by the author, but you often do not have to go beyond that. In the case of such excellent popular books as Whitehead's *Introduction to Mathematics*, Lincoln Barnett's *The Universe and Dr. Einstein*, and Barry Commoner's *The Closing Circle*, something more is required. This is particularly true of a book like Commoner's, on a subject—the environmental crisis—of special interest and importance to all of us today. The writing is compact and requires constant attention. But the book as a whole has implications that the careful reader will not miss. Although it is not a practical work, in the sense described above in Chapter 13, its theoretical conclusions have important consequences. The mere mention of the book's subject matter—the environmental crisis—suggests this. The environment in question is our own; if it is undergoing a crisis of some sort, then it inevitably follows, even if the author had not said so—though in fact he has—that we are also involved in the crisis. The thing to do in a crisis is (usually) to act in a certain way, or to stop acting in a certain way. Thus Commoner's book, though essentially theoretical, has a significance that goes beyond the theoretical and into the realm of the practical.

This is not to suggest that Commoner's work is important and the books by Whitehead and Barnett unimportant. When *The Universe and Dr. Einstein* was written, as a theoretical account (written for a popular audience) of the history of researches into the atom, people were widely aware of the perils inherent in atomic physics, as represented mainly but not exclusively by the recently discovered atomic bomb. Thus that theoretical book also had practical consequences. But even if people are today not so worried about the imminence of an atomic or nuclear war, there is still what may be called a practical necessity to read this theoretical book, or one like it. The reason is that atomic and nuclear physics is one of the great achievements of our age. It promises great things for man, at the same time that it poses great perils. An informed and concerned reader should know everything he can about the subject.

A slightly different urgency is exerted by Whitehead's *Introduction to Mathematics*. Mathematics is one of the major modern mysteries. Perhaps it is the leading one, occupying a place in our society similar to the religious mysteries of another age. If we want to know something about what our age is all about, we should have some understanding of what mathematics is, and of how the mathematician operates and thinks. Whitehead's book, although it does not go very deeply into the more abstruse branches of the subject, is remarkably eloquent about the principles of mathematical reasoning. If it does nothing else, it shows the attentive reader that the mathematician is an ordinary man, not a magician. And that discovery, too, is important for any reader who desires to expand his horizons beyond the immediate here and now of thought and experience.

8. Philosophy

Children ask magnificent questions. “Why are people?” “What makes the cat tick?” “What’s the world’s first name?” “Did God have a reason for creating the earth?” Out of the mouths of babes comes, if not wisdom, at least the search for it. Philosophy, according to Aristotle, begins in wonder. It certainly begins in childhood, even if for most of us it stops there, too.

The child is a natural questioner. It is not the number of questions he asks but their character that distinguishes him from the adult. Adults do not lose the curiosity that seems to be a native human trait, but their curiosity deteriorates in quality. They want to know whether something is so, not why. But children’s questions are not limited to the sort that can be answered by an encyclopaedia.

What happens between the nursery and college to turn the flow of questions off, or, rather, to turn it into the duller channels of adult curiosity about matters of fact? A mind not agitated by good questions cannot appreciate the significance of even the best answers. It is easy enough to learn the answers. But to develop actively inquisitive minds, alive with real questions, profound questions—that is another story.

Why should we have to try to develop such minds, when children are born with them? Somewhere along the line, adults must fail somehow to sustain the infant’s curiosity at its original depth. School itself, perhaps, dulls the mind—by the dead weight of rote learning, much of which may be necessary. The failure is probably even more the parents’ fault. We so often tell a child there is no answer, even when one is available, or demand that he ask no more questions. We thinly conceal our irritation when baffled by the apparently unanswerable query. All this discourages the child. He may get the impression that it is impolite to be too inquisitive. Human inquisitiveness is never killed; but it is soon debased to the sort of questions asked by most college students, who, like the adults they are soon to become, ask only for information.

We have no solution for this problem; we are certainly not so brash as to think we can tell you how to answer the profound and wondrous questions that children put. But we do want you to recognize that one of the most remarkable things about the great philosophical books is that they ask the same sort of profound questions that children ask. The ability to retain the child’s view of the world, with at the same time a mature understanding of what it means to retain it, is extremely rare—and a person who has these qualities is likely to be able to contribute something really important to our thinking.

We are not required to think as children in order to understand existence. Children certainly do not, and cannot, understand it—if, indeed, anyone can. But we must be able to see as children see, to wonder as they wonder, to ask as they ask. The complexities of adult life get in the way of the truth. The great philosophers have always been able to clear away the complexities and see simple distinctions— simple once they are stated, vastly difficult before. If we are to follow them we too must be childishly simple in our questions—and maturely wise in our replies.

Modern Philosophy and the Great Tradition

For the sake of brevity in what follows, let us call questions about what is and happens in the world, or about what men ought to do or seek, “first-order questions.” We should recognise, then, that there are also “second-order questions” that can be asked: questions about our first-order knowledge, questions about the content of our thinking when we try to answer first-order questions, questions about the ways in which we express such thoughts in language.

This distinction between first-order and second-order questions is useful, because it helps to explain what has happened to philosophy in recent years. The majority of professional philosophers at the present day no longer believe that first-order questions can be answered by philosophers. Most professional philosophers today devote their attention exclusively to second-order questions, very often to questions having to do with the language in which thought is expressed.

That is all to the good, for it is never harmful to be critical. The trouble is the wholesale giving up of first-order philosophical questions, which are the ones that are most likely to interest lay readers. In fact, philosophy today, like contemporary science or mathematics, is no longer being written for lay readers. Second-order questions are, almost by definition, ones of narrow appeal; and professional philosophers, like scientists, are not interested in the views of anyone but other experts.

This makes modern philosophy very hard to read for non-philosophers—as difficult, indeed, as science for non-scientists. We cannot in this book give you any advice about how to read modern philosophy as long as it is concerned exclusively with second-order questions. However, there are philosophical books that you can read, and that we believe you should read. These books ask the kinds of questions that we have called first-order ones. It is not accidental that they were also written primarily for a lay audience rather than exclusively for other philosophers.

Up to about 1930, or perhaps even a little later, philosophical books were written for the general reader. Philosophers hoped to be read by their peers, but they also wanted to be read by ordinary, intelligent men and women. Since the questions that they asked and tried to answer were of concern to everyone, they thought that everyone should know what they thought.

All of the great classical works in philosophy, from Plato onward, were written from this point of view. These books are accessible to the lay reader; you can succeed in reading them if you wish to. Everything that we have to say in this chapter is intended to help you do that.

On Philosophical Method

It is important to understand what philosophical method consists in—at least insofar as philosophy is conceived as asking and trying to answer *first-order questions*. Suppose that you are a philosopher who is troubled by one of the childishly simple questions we have mentioned—the question, for instance, about the properties of everything that exists, or the question about the nature and causes of change. How do you proceed?

If your question were scientific, you would know that to answer it you would have to perform some kind of special research, either by way of developing an experiment to test your answer, or by way of observing a wide range of phenomena. If your question were historical, you would know that you would also have to perform research, although of a different kind. But there is no experiment that will tell you what all existing things have in common, precisely in respect to having existence. There are no special kinds of phenomena that you can observe, no documents that you can seek out and read, in order to find out what change is or why things change. All you can do is reflect upon the question. There is, in short, nothing to do but think.

You are not thinking in a total vacuum, of course. Philosophy, when it is good, is not “pure” speculation—thinking divorced from experience. Ideas cannot be put together just any way. There are stringent tests of the validity of answers to philosophical questions. But such tests are based on common experience alone—on the experience that you already have because you are a human being, not a philosopher. You are as well acquainted through common experience with the phenomena of change as anybody else; everything in the world about you manifests mutability. As far as the mere experience of change goes, you are in as good a position to think about its nature and causes as the greatest philosophers. What distinguishes them is that they thought about it extremely well: they formulated the most penetrating questions that could be asked about it, and they undertook to develop carefully and clearly worked-out answers. By what means? Not by investigation. Not by having or trying to get more experience than the rest of us have. Rather, by thinking more profoundly about the experience than the rest of us have.

Understanding this is not enough. We must also realize that not all of the questions that philosophers have asked and tried to answer are truly philosophical. They themselves were not always aware of this, and their ignorance or mistake in this crucial respect can cause unperceptive readers considerable difficulty. To avoid such difficulties, it is necessary to be able to distinguish the truly philosophical questions from the other questions that a philosopher may deal with, but that he should have waived and left for later scientific investigation to answer. The philosopher was misled by failing to see that such questions can be answered by scientific investigation, though he probably could not have known this at the time of his writing.

An example of this is the question that ancient philosophers asked about the difference between the matter of terrestrial and celestial bodies. To their observation, unaided by telescopes, it appeared to be the case that the heavenly bodies changed only in place; they did not appear to come into being or to pass away, like plants and animals;

nor did they appear to change in size or quality. Because celestial bodies were subject to one kind of change only—local motion— whereas all terrestrial bodies change in other respects as well, the ancients concluded that they had to be composed of a different kind of matter. They did not surmise, nor could they probably have surmised, that with the invention of the telescope, the heavenly bodies would give us knowledge of their mutability beyond anything we can know through common experience. Hence they took as a question that they thought it proper for philosophers to answer one that should have been reserved for later scientific investigation. Such investigation began with Galileo's use of the telescope and his discovery of the moons of Jupiter; this led to the revolutionary assertion by Kepler that the matter of the heavenly bodies is exactly the same as the matter of bodies on earth; and this in turn laid the groundwork for Newton's formulation of a celestial mechanics in which the same laws of motion apply without qualification to all bodies wherever they are in the physical universe.

On the whole, apart from the confusions that may result, the misinformation or lack of information about scientific matters that mars the work of the classical philosophers is irrelevant. The reason is that it is philosophical questions, not scientific or historical ones, that we are interested in when we read a philosophical work. And, at the risk of repeating ourselves, we must emphasise that there is no other way than thinking to answer such questions. If we could build a telescope or microscope to examine the properties of existence, we should do so, of course. But no such instruments are possible.

We do not want to give the impression that it is only philosophers who make mistakes of the sort we are discussing here. Suppose a scientist becomes troubled by

the question about the kind of life a man ought to lead. This is a question in normative philosophy, and the only way to answer it is by thinking about it. But the scientist may not realize that, and instead suppose that some kind of experiment or research will give him an answer. He may decide to ask 1,000 persons what kind of life they would like to lead, and base his answer to the question on their answers. But it should be obvious that his answer, in that case, would be as irrelevant as Aristotle's speculations about the matter of the celestial bodies.

On Philosophical Styles

Although there is only one philosophical method, there are at least five styles of exposition that have been employed by the great philosophers of the Western tradition. The student or reader of philosophy should be able to distinguish between them and know the advantages and disadvantages of each.

1. **THE PHILOSOPHICAL DIALOGUE:** The first philosophical style of exposition, first in time if not in effectiveness, is the one adopted by Plato in his *Dialogues*. The style is conversational, even colloquial; a number of men discuss a subject with Socrates (or, in the later dialogues, with a speaker known as The Athenian Stranger); often, after a certain amount of fumbling, Socrates embarks on a series of questions and comments that help to elucidate the subject. In the hands of a master like Plato, this style is heuristic, that is, it allows the reader, indeed leads him, to discover things for himself. When the style is enriched by the high drama—some would say the high comedy—of the story of Socrates, it becomes enormously powerful.

“A master like Plato,” we said—but there is no one “like” Plato. Other philosophers have attempted dialogues—for example, Cicero and Berkeley—but with little success. Their dialogues are flat, dull, almost unreadable. It is a measure of the greatness of Plato that he was able to write philosophical dialogues that, for wit, charm, and profundity are the equal of any books ever produced by anyone, on any subject. Yet it may be a sign of the inappropriateness of this style of philosophizing that no one except Plato has ever been able to handle it effectively.

That Plato did so, goes without saying. All Western philosophy, Whitehead once remarked, is but “a footnote to Plato”; and the later Greeks themselves had a saying: “Everywhere I go in my head, I meet Plato coming back.” Those statements, however, should not be misunderstood. Plato himself had apparently no philosophical system, no doctrine—unless it was that there is no doctrine, that we should simply keep talking. And asking questions. For Plato, and Socrates before him, did indeed manage to raise most of the important questions that subsequent philosophers have felt it necessary to deal with.

2. **THE PHILOSOPHICAL TREATISE OR ESSAY:** Aristotle was Plato’s best pupil; he studied under him for twenty years. He is said to have also written dialogues, but none of these survives entirely. What does survive are curiously difficult essays or treatises on a number of different subjects. Aristotle was obviously a clear thinker, but the difficulty of the surviving works has led scholars to suggest that they were originally notes for lectures or books—either Aristotle’s own notes, or notes taken down by a student who heard the master speak. We may never know the truth of the matter, but in any event the Aristotelean treatise was a new style in philosophy.

The subjects covered by Aristotle in his treatises, and the various styles adopted by him in presenting his findings, also helped to establish the branches and approaches of philosophy in the succeeding centuries. There are, first of all, the so-called popular works—mostly dialogues, of which only fragments have come down to us. Then there are the documentary collections. The major one that we know about was a collection of 158 separate constitutions of Greek states. Only one of these survives, the constitution of Athens, which was recovered from a papyrus in 1890. Finally, there are the major treatises, some of which, like the *Physics* and *Metaphysics*, or the *Ethics*, *Politics*, and *Poetics*, are purely philosophical works, theoretical or normative; some of which, like the book *On the Soul*, are mixtures of philosophical theory and early scientific investigation; and some of which, like the biological treatises, are mainly scientific works in the field of natural history.

Immanuel Kant, although he was probably more influenced by Plato in a philosophical sense, adopted Aristotle's style of exposition. His treatises are finished works of art, unlike Aristotle's in this respect. They state the main problem first, go through the subject matter in a thorough and business-like way, and treat special problems by the way or at the last. The clarity of both Kant and Aristotle may be said to consist in the order that they impose on a subject. We see a philosophical beginning, middle, and end. We also, particularly in the case of Aristotle, are provided with accounts of the views and objections of others, both philosophers and ordinary men. Thus, in one sense the style of the treatise is similar to the style of the dialogue. But the element of drama is missing from the Kantian or Aristotelean treatise; a philosophical view is developed through straightforward exposition rather than through the conflict of positions and opinions, as in Plato.

3. **THE MEETING OF OBJECTIONS:** The philosophical style developed in the Middle Ages and perfected by St. Thomas Aquinas in his *Summa Theologica* has likenesses to both of those already discussed. Plato, we have pointed out, raises most of the persistent philosophical problems; and Socrates, as we might have observed, asks in the course of the dialogues the kind of simple but profound questions that children ask. And Aristotle, as we have also pointed out, recognizes the objections of other philosophers and replies to them.

Aquinas' style is a combination of question-raising and objection-meeting. The *Summa* is divided into parts, treatises, questions, and articles. The form of all the articles is the same. A question is posed; the opposite (wrong) answer to it is given; arguments are adduced in support of that wrong answer; these are countered first by an authoritative text (often a quotation from Scripture); and finally, Aquinas introduces his own answer or solution

with the words “I answer that.” Having given his own view of the matter, he then replies to each of the arguments for the wrong answer.

The neatness and order of this style are appealing to men with orderly minds, but that is not the most important feature of the Thomistic way of philosophizing. Rather, it is Aquinas’ explicit recognition of conflicts, his reporting of different views, and his attempt to meet all possible objections to his own solutions. The idea that the truth somehow evolves out of opposition and conflict was a common medieval one. Philosophers in Aquinas’ time accepted as a matter of course that they should be prepared to defend their views in open, public disputes, which were often attended by crowds of students and other interested persons. The civilization of the Middle Ages was essentially oral, partly because books were few and hard to come by. A proposition was not accepted as true unless it could meet the test of open discussion; the philosopher was not a solitary thinker, but instead faced his opponents in the intellectual market place (as Socrates might have said). Thus, the *Summa Theologica* is imbued with the spirit of debate and discussion.

4. **THE SYSTEMIZATION OF PHILOSOPHY:** In the seventeenth century, a fourth style of philosophical exposition was developed by two notable philosophers, Descartes and Spinoza. Fascinated by the promised success of mathematics in organizing man’s knowledge of nature, they attempted to organize philosophy itself in a way akin to the organization of mathematics.

Descartes was a great mathematician and, although perhaps wrong on some points, a redoubtable philosopher. What he tried to do, essentially, was to clothe philosophy in mathematical dress—to give it the certainty and formal structure that Euclid, two thousand years before, had given geometry. Descartes was not wholly unsuccessful in this, and his demand for clarity and distinctness in thinking was to some extent justified in the chaotic intellectual climate of his time. He also wrote philosophical treatises in a more or less traditional form, including a set of replies to objections to his views.

Spinoza carried the conception even farther. His *Ethics* is written in strict mathematical form, with propositions, proofs, corollaries, lemmas, scholiums, and the like. However, the subject matter of metaphysics and of morals is not very satisfactorily handled in this manner, which is more appropriate for geometry and other mathematical subjects than for philosophical ones. A sign of this is that when reading Spinoza you can skip a great deal, in exactly the same way that you can skip in Newton. You cannot skip anything in Kant or Aristotle, because the line of reasoning is continuous; and you cannot skip anything in Plato, any more than you would skip a part of a play or poem.

Probably there are no absolute rules of rhetoric. Nevertheless, it is questionable whether it is possible to write a satisfactory philosophical work in mathematical form, as Spinoza tried to do, or a satisfactory scientific work

in dialogue form, as Galileo tried to do. The fact is that both of these men failed to some extent to communicate what they wished to communicate, and it seems likely that the form they chose was a major reason for the failure.

5. **THE APHORISTIC STYLE:** There is one other style of philosophical exposition that deserves mention, although it is probably not as important as the other four. This is the aphoristic style adopted by Nietzsche in such works as *Thus Spake Zarathustra* and by certain modern French philosophers. The popularity of this style during the past century is perhaps owing to the great interest, among Western readers, in the wisdom books of the East, which are written in an aphoristic style. This style may also owe something to the example of Pascal's *Pensées*. But of course Pascal did not intend to leave his great work in the form of short, enigmatic statements; he died before he could finish writing out the book in essay form.

The great advantage of the aphoristic form in philosophy is that it is heuristic; the reader has the impression that more is being said than is actually said, for he does much of the work of thinking—of making connections between statements and of constructing arguments for positions—himself. At the same time, however, this is the great disadvantage of the style, which is really not expositional at all. The author is like a hit-and-run driver; he touches on a subject, he suggests a truth or insight about it, and then runs off to another subject without properly defending what he has said. Thus, although the aphoristic style is enjoyable for those who are poetically inclined, it is irritating for serious philosophers who would rather try to follow and criticize an author's line of thought.

As far as we know, there is no other important style of philosophical exposition that has been employed in our Western tradition. (A work like Lucretius' *On the Nature of Things* is not an exception. It was originally in verse; but as far as its style goes, it is no different from other philosophical essays; and in any event we ordinarily read it nowadays in prose translations.) This means that all of the great philosophers have employed one or the other of these five styles; sometimes, of course, a philosopher tries more than one. The treatise or essay is probably the most common form, both in the past and in the present. It can range all the way from highly formal and difficult works like those of Kant, to popular philosophical essays or letters. Dialogues are notoriously hard to write, and the geometrical style is enormously difficult both to write and to read. The aphoristic style is highly unsatisfactory from a philosophical point of view. The Thomistic style has not been used very much in recent times. Perhaps it would not be acceptable to modern readers, but that seems a shame, considering all its advantages.

Hints for Reading Philosophy

It is perhaps clear from the discussion so far that the most important thing to discover in reading any philosophical work is the question or questions it tries to answer. The questions may be stated explicitly, or they may be implicit to a certain extent. In either case, you must try to find out what they are.

How the author answers these questions will be deeply affected by his controlling principles. These may be stated, too, but that is not always the case. We have already quoted Basil Willey on the difficulty—and the importance—of discovering the hidden and unstated assumptions of an author, to say nothing of our own. This goes for any book. It applies to works in philosophy with particular force.

The great philosophers cannot be charged with having tried to hide their assumptions dishonestly, or with having been unclear in their definitions and postulations. It is precisely the mark of a great philosopher that he makes these things clearer than other writers can. Nevertheless, every great philosopher has certain controlling principles that underlie his work. These are easy enough to see if he states them in the book you are reading. But he may not have done so, reserving their treatment for another book. Or he may never treat them explicitly, but instead allow them to pervade every one of his works.

It is difficult to give examples of such controlling principles. Any that we might proffer would probably be disputed by philosophers, and we do not here have space to defend our choices. Nevertheless, we could mention the controlling idea of Plato that conversation about philosophical subjects is perhaps the most important of all human activities. Now this idea is seldom explicitly stated in the dialogues, although Socrates may be saying it when, in the *Apology*, he asserts that the unexamined life is not worth living, and Plato mentions it in the *Seventh Letter*. The point is that Plato expresses this view in a number of other places, though not in so many words—for example, in the *Protagoras*, where the audience is shown as disapproving of Protagoras' unwillingness to continue talking to Socrates. Another example is that of Cephalus, in Book I of the *Republic*, who happens to have other business to attend to and so departs. Plato seems to be saying here, though not explicitly, that it is a betrayal of man's deepest nature to refuse to join, for whatever reason, in the search for truth. But, as we have noted, this is not ordinarily cited as one of Plato's "ideas," because it is seldom explicitly discussed in his works.

We can find other examples in Aristotle. In the first place, it is always important to recognize, in reading any Aristotelean work, that things said in other works are relevant to the discussion. Thus the basic principles of logic, expounded in the *Organon*, are assumed in the *Physics*. In the second place, owing partly to the fact that the treatises are not finished works of art, their controlling principles are not always stated with satisfactory clarity. The *Ethics* is about many things: happiness, habit, virtue, pleasure, and so forth—the list could be very long. But the controlling insight is discovered only by the very careful reader. This is the insight that happiness is the *whole* of the good, not the *highest* good, for in that case it would be only one good among others. Recognizing this, we see that happiness does not consist in self-perfection, or the goods of self-improvement, even

though these constitute the highest among partial goods. Happiness, as Aristotle says, is the quality of a *whole* life, and he means “whole” not only in a temporal sense but also in terms of all the aspects from which a life can be viewed. The happy man is one, as we might say nowadays, who puts it all together—and keeps it there throughout his life. This insight is controlling in the sense that it affects almost all of the other ideas and insights in the *Ethics*, but it is not stated nearly as explicitly as it might be.

One more example. Kant’s mature thought is often known as critical philosophy. He himself contrasted “criticism” to “dogmatism,” which he imputed to many previous philosophers. By “dogmatism” he meant the presumption that the human intellect can arrive at the most important truths by pure thinking, without being aware of its own limitations. What is first required, according to Kant, is a critical survey and assessment of the mind’s resources and powers. Thus, the limitation of the mind is a controlling principle in Kant in a way that it is not in any philosopher who precedes him in time. But while this is perfectly clear because explicitly stated in the *Critique of Pure Reason*, it is not stated, because it is assumed, in the *Critique of Judgment*, Kant’s major work in aesthetics. Nevertheless, it is controlling there as well.

This is all we can say about finding the controlling principles in a philosophical book, because we are not sure that we can tell you how to discover them. Sometimes it takes years to do this, and many readings and rereadings. Nevertheless, it is the ideal goal of a good and thorough reading, and you should keep in mind that it is ultimately what you must try to do if you are to understand your author. Despite the difficulty of discovering these controlling principles, however, we do not recommend that you take the shortcut of reading books about the philosophers, their lives and opinions. The discovery you come to on your own will be much more valuable than someone else’s ideas.

Once you have found an author’s controlling principles, you will want to decide whether he adheres to them throughout his work. Unfortunately, philosophers, even the best of them, often do not do so. Consistency, Emerson said, “is the hobgoblin of little minds.” That is a very carefree statement, but although it is probably wise to remember it, there is no doubt, either, that inconsistency in a philosopher is a serious problem. If a philosopher is inconsistent, you have to decide which of two sets of propositions he really means—the first principles, as he states them; or the conclusions, which do not in fact follow from the principles as stated. Or you may decide that neither is valid.

The reading of philosophical works has special aspects that relate to the difference between philosophy and science. We are here considering only theoretical works in philosophy, such as metaphysical treatises or books about the philosophy of nature.

The philosophical problem is to explain, not to describe, as science does, the nature of things. Philosophy asks about more than the connections of phenomena. It seeks to penetrate to the ultimate causes and conditions that underlie them. Such problems are satisfactorily explored only when the answers to them are supported by clear arguments and analysis.

The major effort of the reader, therefore, must be with respect to the terms and the initial propositions. Although the philosopher, like the scientist, has a technical terminology, the words that express his terms are usually taken from common speech, but used in a very special sense. This demands special care from the reader. If he does not overcome the tendency to use familiar words in a familiar way, he will probably make gibberish and nonsense of the book.

The basic terms of philosophical discussions are, of course, abstract. But so are those of science. No general knowledge is expressible except in abstract terms. There is nothing particularly difficult about abstractions. We use them every day of our lives and in every sort of conversation. However, the words “abstract” and “concrete” seem to trouble many persons.

Whenever you talk generally about anything, you are using abstractions. What you perceive through your senses is always concrete and particular. What you think with your mind is always abstract and general. To understand an “abstract word” is to have the idea it expresses. “Having an idea” is just another way of saying that you understand some general aspect of the things you experience concretely. You cannot see or touch or even imagine the general aspect thus referred to. If you could, there would be no difference between the senses and the mind. People who try to imagine what ideas refer to befuddle themselves, and end up with a hopeless feeling about all abstractions.

Just as inductive arguments should be the reader’s main focus in the case of scientific books, so here, in the case of philosophy, you must pay closest attention to the philosopher’s principles. They may be either things he asks you to assume with him, or matters that he calls self-evident. There is no trouble about assumptions. Make them to see what follows, even if you yourself have contrary presuppositions. It is a good mental exercise to pretend that you believe something you really do not believe. And the clearer you are about your own prejudgments, the more likely you will be not to misjudge those made by others.

It is the other sort of principles that may cause trouble. Few philosophical books fail to state some propositions that the author regards as self-evident. Such propositions are drawn directly from experience rather than proved by other propositions.

The thing to remember is that the experience from which they are drawn, as we have noted more than once, is, unlike the scientist’s special experience, the common experience of mankind. The philosopher does no work in laboratories, no research in the field. Hence to understand and test a philosopher’s leading principles you do not need the extrinsic aid of special experience, obtained by methodical investigation. He refers you to your own common sense and daily observation of the world in which you live.

In other words, the method according to which you should read a philosophical book is very similar to the method according to which it is written. A philosopher, faced with a problem, can do nothing but think about it. A reader, faced with a philosophical book, can do nothing but read it—which means, as we know, thinking about it. There are no other aids except the mind itself.

But this essential loneliness of reader and book is precisely the situation that we imagined at the beginning of our long discussion of the rules of analytical reading. Thus you can see why we say that the rules of reading, as we have stated and explained them, apply more directly to the reading of philosophical books than to the reading of any other kind.

On Making Up Your Own Mind

A good theoretical work in philosophy is as free from oratory and propaganda as a good scientific treatise. You do not have to be concerned about the “personality” of the author, or investigate his social and economic background. There is utility, however, in reading the works of other great philosophers who have dealt with the same problems as your author. The philosophers have carried on a long conversation with each other in the history of thought. You had better listen in on it before you make up your mind about what any of them says.

The fact that philosophers disagree should not trouble you, for two reasons. First, the fact of disagreement, if it is persistent, may point to a great unsolved and, perhaps, insoluble problem. It is good to know where the true mysteries are. Second, the disagreements of others are relatively unimportant. Your responsibility is only to make up your own mind. In the presence of the long conversation that the philosophers have carried on through their books, you must judge what is true and

what is false. When you have read a philosophical book well—and that means reading other philosophers on the same subject, too—you are in a position to judge.

It is, indeed, the most distinctive mark of philosophical questions that everyone must answer them for himself. Taking the opinions of others is not solving them, but evading them. And your answers must be solidly grounded, with arguments to back them up. This means, above all, that you cannot depend on the testimony of experts, as you may have to do in the case of science.

The reason is that the questions philosophers ask are simply more important than the questions asked by anyone else. Except children.

9. Theology

There are two kinds of theology, natural theology and dogmatic theology. Natural theology is a branch of philosophy; it is the last chapter, as it were, in metaphysics. If you ask, for example, whether causation is an endless process, whether everything is caused, you may find yourself, if you answer in the affirmative, involved in an infinite regress. Therefore you may have to posit some originating cause that is not itself caused. Aristotle called this uncaused cause an unmoved mover. You could give it other names—you could even say that it was merely another name for God—but the point is that you would have arrived at the conception by the unaided effort—the natural working—of your mind.

Dogmatic theology differs from philosophy in that its first principles are articles of faith adhered to by the communicants of some religion. A work of dogmatic theology always depends upon dogmas and the authority of a church that proclaims them.

If you are not of the faith, if you do not belong to the church, you can nevertheless read such a theological book *well* by treating its dogmas with the same respect you treat the assumptions of a mathematician. But you must always keep in mind that an article of faith is not something that the faithful *assume*. Faith, for those who have it, is the most certain form of knowledge, not a tentative opinion.

Understanding this seems to be difficult for many readers today. Typically, they make either or both of two mistakes in dealing with dogmatic theology. The first mistake is to refuse to accept, even temporarily, the articles of faith that are the first principles of the author. As a result, the reader continues to struggle with these first principles, never really paying attention to the book itself. The second mistake is to assume that, because the first principles are dogmatic, the arguments based on them, the reasoning that they support, and the conclusions to which they lead are all dogmatic in the same way. It is true enough, of course, if certain principles are accepted, and the reasoning that is based on them is cogent, that the conclusions must then be accepted too—at least to the extent that the principles are. But if the reasoning is defective, the most acceptable first principles will lead to invalid conclusions.

We are speaking here, as you can see, of the difficulties that face a non-believing reader of a theological work. His task is to accept the first principles as true while he is reading the book, and then to read it with all the care that any good expository work deserves. The faithful reader of a work that is essential to his faith has other difficulties to face. However, these problems are not confined to reading theology.

How to Read “Canonical” Books

There is one very interesting kind of book, one kind of reading, that has not yet been discussed. We use the term “canonical” to refer to such books; in an older tradition we might have called them “sacred” or “holy,” but those words no longer apply to all such works, though they still apply to some of them.

A prime example is the Holy Bible, when it is read not as literature but instead as the revealed Word of God. For orthodox Marxists, however, the works of Marx must be read in much the same way as the Bible must be read by orthodox Jews or Christians. And Mao Tse-tung’s Little Red Book has an equally canonical character for a “faithful” Chinese Communist.

The notion of a canonical book can be extended beyond these obvious examples. Consider any institution—a church, a political party, a society—that among other things (1) is a teaching institution, (2) has a body of doctrine to teach, and (3) has a faithful and obedient membership. The members of any such organization read *reverentially*. They do not—even cannot—question the authorized or right reading of the books that to them are canonical. The faithful are debarred by their faith from finding error in the “sacred” text, to say nothing of finding nonsense there.

Orthodox Jews read the Old Testament in this way; Christians, the New Testament; Muslims, the Koran; orthodox Marxists, the works of Marx and Lenin and, depending on the political climate, those of Stalin; orthodox Freudian psychoanalysts, the works of Freud; U.S. Army officers, the infantry manual. And you can think of many more examples by yourself.

In fact, almost all of us, even if we have not quite reached it, have approached the situation in which we must read canonically. A fledgling lawyer, intent on passing the bar exams, must read certain texts in a certain way in order to attain a perfect score. So with doctors and other professionals; and indeed so with all of us when, as students, we were required at the peril of “failure” to read a text according to our professor’s interpretation of it. (Of course, not all professors fail their students for disagreeing with them!)

The characteristics of this kind of reading are perhaps summed up in the word “orthodox,” which is almost always applicable. The word comes from two Greek roots, meaning “right opinion.” These are books for which there is *one and only one right reading*; any other reading or interpretation is fraught with peril, from the loss of an “A” to the damnation of one’s soul. This characteristic carries with it an obligation. The faithful reader of a canonical book *is obliged to make sense out of it* and to find it true in one or another sense of “true.” If he cannot do this by himself, *he is obliged to go to someone who can*. This may be a priest or a rabbi, or it may be his superior in the party hierarchy, or it may be his professor. In any case, he is obliged to accept the resolution of his problem that is offered him. He reads essentially without freedom; but in return for this he gains a kind of satisfaction that is possibly never obtained when reading other books.

Here, in fact, we must stop. The problem of reading the Holy Book—if you have faith that it is the Word of God—is the most difficult problem in the whole field of reading. There have been more books written about how to read Scripture than about all other aspects of the art of reading together. The Word of God is obviously the most difficult writing men can read; but it is also, if you believe it *is* the Word of God, the most important to read. The effort of the faithful has been duly proportionate to the difficulty of the task. It would be true to say that, in the European tradition at least, the Bible is *the* book in more senses than one. It has been not only the most widely read, but also the most carefully read, book of all.

10. Social Science

The concepts and terminology of the social sciences pervade almost everything we read today.

Modern journalism, for example, does not limit itself to reporting facts, except in the kind of shorthand, “who-what-why-when-where” news story that one finds on the front page of a newspaper. Journalists, much more commonly, enmesh the facts in interpretation, commentary, analysis of the news. These interpretations and comments draw on the concepts and terminology of the social sciences.

These concepts and this terminology are also reflected in the vast number of current books and articles that may be grouped together under the heading of social criticism. We are confronted with a continuous flow of literature on such subjects as race problems, crime, law enforcement, poverty, education, welfare, war and peace, good and bad government. Much of this literature borrows its ideology and language from the social sciences.

The literature of social science is not confined to nonfiction. There is also a large and important category of contemporary writing that might be termed social-science fiction. Here the aim is to create artificial models of society that allow us, for example, to explore the social consequences of technological innovation. The organization of social power, the kinds of property and ownership, and the distribution of wealth are variously described, deplored, or lauded in novels, plays, stories, moving pictures, television shows. Insofar as they do this they may be said to have social significance or to contain “relevant messages.” At the same time they draw on and disseminate elements of the social sciences.

Furthermore, there is hardly any social, economic, or political problem that has not been tackled by specialists in these fields, either on their own or by invitation from officials who are actively coping with these problems. Specialists in the social sciences help to formulate the problems and are called upon to help in dealing with them.

Far from the least important factor in the growing pervasiveness of the social sciences is their introduction at the high school level and in the junior and community colleges. In fact, student enrollments in social science courses are running far ahead of enrollments in the more traditional literature and language courses. And enrollments in social science courses greatly exceed those in courses dealing with the “pure” sciences.

What Is Social Science?

We have been talking of social science as if it were a single entity. That is hardly the case.

Which, in fact, are the social sciences? One way to answer the question is to see what departments and disciplines universities group under this name. Social science divisions usually include departments of anthropology, economics, politics, and sociology. Why do they not ordinarily include as well schools of law, education, business, social service, and public administration, all of which draw on the concepts and methods of the social sciences for their development? The reason commonly given for the separation of these schools from the social science divisions is that the main purpose of such schools is to train for professional work outside of the university, while the previously mentioned departments are more exclusively dedicated to the pursuit of systematic knowledge of human society, an activity that usually goes on within the university.

There is presently a trend in universities toward the establishment of centers and institutes for interdisciplinary studies. These centers cut across the conventional social science departments and professional schools, and include studies in the theories and methods of statistics, demography, psephology (the science of elections and polling), policy-and decision-making, recruitment and treatment of personnel, public administration, human ecology, and many more. Such centers are producing studies and reports that incorporate findings of a dozen or more of these specialties. Considerable sophistication is required even to discern the various strands of these efforts, let alone judge the validity of the findings and conclusions.

What about psychology? Those social scientists who interpret their field strictly tend to exclude psychology on the grounds that it concerns itself with individual and personal characteristics, while the social sciences proper focus on cultural, institutional, and environmental factors. Those who are less strict, while conceding that physiological psychology should be subsumed under the biological sciences, hold that psychology, both normal and abnormal, should be regarded as a social science on the grounds of the inseparability of the individual from his social environment.

Psychology, incidentally, is a prime example of a social science area that is currently enjoying great popularity among students. It is possible that enrollments in psychology across the country are larger than in any other subject. And the literature of psychology, at every level from the most technical to the most popular, is enormous.

What of the behavioral sciences? Where do they fit into the social science picture? As originally used, the term behavioral science included sociology and anthropology and the behavioral aspects of biology, economics, geography, law, psychology and psychiatry, and political science. The accent on behavior served to emphasize observable, measurable behavior capable of being systematically investigated and of producing verifiable findings. Recently, the term behavioral sciences has come to be used almost as a synonym of the term social sciences, but many purists object to this usage.

Finally, what about history? It is acknowledged that the social sciences draw on the study of history for data and for exemplifications of their generalisations. However, although history, viewed as accounts of particular events and persons, may be scientific in the minimal sense of constituting systematic knowledge, it is not a science in the sense that of itself it yields systematic knowledge of patterns or laws of behaviour and development.

Is it possible, then, to define what we mean by social science? We think so, at least for the purposes of this chapter. Such fields as anthropology, economics, politics, and sociology constitute a kind of central core of social science, which almost all social scientists would include in any definition. In addition, we think it would be conceded by most social scientists that much, though not all, of the literature of such fields as law, education, and public administration, and some of the literature of such fields as business and social service, together with a considerable portion of psychological literature, falls within the confines of a reasonable definition. We will assume that such a definition, although admittedly imprecise, is clear to you in what follows.

The Apparent Ease of Reading Social Science

A great deal of social science writing seems like the easiest possible material to read. The data are often drawn from experiences familiar to the reader—in this respect, social science is like poetry or philosophy—and the style of exposition is usually narrative, already familiar to the reader through his reading of fiction and history.

In addition, we have all become familiar with the jargon of social science and use it often. Such terms as culture (cross, counter, and sub), in-group, alienation, status, input/output, infra-structure, ethnic, behavioural, consensus, and scores like them, tend to appear in almost every conversation and in almost everything we read.

Consider the word “society” itself. What a chameleon-like word it is, what a host of adjectives can be placed in front of it, while throughout it continues to convey the broad notion of people living together rather than in isolation. We hear of the aberrant society, the abortive society, the acquiescent society, the acquisitive society, the affluent society, and we can continue on through the alphabet until we arrive at the zymotic society, which is one that is in a continuous state of ferment, not unlike our own.

“Social,” as an adjective, is also a word of many and familiar meanings. There is social power, social pressure, and social promise—and then, of course, there are the ubiquitous social problems. The last phrase, indeed, is a fine example of the specious ease that is involved in both the reading and the writing of social science literature. We would be willing to wager that in the last few months, if not the last few weeks, you have read and even possibly written the phrase “political, economic, and social problems.” When you read or wrote it, you were probably clear as to what was meant by political and economic problems. But what did you, or the author, mean by social problems?

The jargon and metaphors of much social science writing, together with the deep feeling that often imbues it, make for deceptively easy reading. The references are to matters that are readily familiar to the reader; indeed, he reads or hears about them almost daily. Furthermore, his attitudes and feelings regarding them are usually firmly developed. Philosophy, too, deals with the world as we commonly know it, but we are not ordinarily “committed” on philosophical questions. But on matters with which social science deals, we are likely to have strong opinions.

Difficulties of Reading Social Science

Paradoxically, the very factors we have discussed, the factors which make social science seem easy to read, also make it difficult to read. Consider the last factor mentioned, for instance—the commitment that you as a reader are likely to have to some view of the matter your author is considering. Many readers fear that it would be disloyal to their commitment to stand apart and impersonally question what they are reading. Yet this is necessary whenever you read analytically. Such a stance is implied by the rules of reading, at least by the rules of structural outlining and interpretation. If you are going to answer the first two questions that should be asked of anything you read, you must, as it were, check your opinions at the door. You cannot understand a book if you refuse to hear what it is saying.

The very familiarity of the terms and propositions in social science writing is also an obstacle to understanding. Many social scientists recognize this themselves. They object vigorously to the use of more or less technical terms and concepts in popular journalism and other writings. An example of such a concept is that of the Gross National Product (GNP). In serious economic writing, the concept is employed in a relatively limited sense. But many reporters and columnists, some social scientists say, make the concept do too much work. They use it too widely, without really understanding what it means. Obviously, if the writer of something you are reading is confused about his use of a key term, you, as reader, must be so, too.

Let us try to make this point clear by drawing a distinction between the social sciences, on the one hand, and the so-called hard sciences—physics, chemistry, and the like—on the other hand. We have observed that the author of a scientific book (taking “scientific” in the latter sense) makes clear what he assumes and what he desires to prove, and also makes sure that his terms and propositions are easy to spot. Since coming to terms and finding the propositions is a main part of reading any expository work, this means that much of the work is done for you in the case of such books. You may still have difficulty with the mathematical form of presentation; and if you do not have a firm grasp of the arguments and of the experimental or observational basis of the conclusions, you will find it hard to criticize the book—that is, to answer the questions, Is it true? and What of it? Nevertheless, there is an important sense in which the reading of this kind of scientific books is easier than the reading of most other kinds of expository works.

Another way to say what it is that the hard scientist does is to say that he “stipulates his usage”—that is, he informs you what terms are essential to his argument and how he is going to use them. Such stipulations usually occur at the beginning of the book, in the form of definitions, postulates, axioms, and so forth.

Since stipulation of usage is characteristic of these fields, it has been said that they are like games or have a “game structure.” Stipulation of usage is like establishing the rules of a game. If you want to play poker, you do not dispute the rule that three of a kind is a better hand than two pairs; if you want to play bridge, you do not argue with the convention that a queen takes a jack (in the same suit), or that the highest trump takes any other card (in a suit contract). Similarly, you do not dispute a hard scientist’s stipulations in reading his book. You accept them, and go on from there.

Until quite recently, at least, stipulation of usage was not as common in the social sciences as it is in the hard sciences. One reason for this is that the social sciences were typically not mathematicized. Another is that stipulation of usage in the social or behavioral sciences is *harder to do*. It is one thing to define a circle or an isosceles triangle; it is quite another to define an economic depression or mental health. Even if a social scientist attempts to define such terms, his readers are inclined to question his usage. As a result, the social scientist must continue to struggle with his own terms throughout his work—and his struggle creates problems for his reader.

The most important source of difficulty in reading social science derives from the fact that this field of literature is a mixed, rather than a pure, kind of expository writing. We have seen how history is a mixture of fiction and science, and how we must read it with that in mind. We are familiar with this kind of mixture; we have had a great deal of experience with it. The situation in social science is quite different. Much social science is a mixture of science, philosophy, and history, often with some fiction thrown in for good measure.

If social science were always the same kind of mixture, we could become familiar with it as we have with history. But this is far from the case. The mixture itself shifts from book to book, and the reader is confronted with the task of identifying the various strands that go to make up what he is reading. These strands may change in the course of a single book as well as in different books. It is no easy job to separate them out.

You will recall that the first step the analytical reader has to take is to answer the question, What kind of book is this? In the case of fiction, that question is relatively easy to answer. In the case of science and philosophy, it is also relatively easy; and even if history is a mixed form, at least the reader ordinarily knows that he is reading history. But the various strands that go to make up social science—sometimes interwoven in this pattern, sometimes in that, sometimes in still another—make the question very hard to answer when we are reading a work in any of the fields involved. The problem, in fact, *is precisely as difficult as the problem of defining social science*.

Nevertheless, the analytical reader must somehow manage to answer the question. It is not only his first task, but also his most important. If he is able to say what strands go to make up the book he is reading, he will have moved a good way toward understanding it.

Outlining a work in social science poses no special problems, but coming to terms with the author, as we have already suggested, may be extremely difficult, owing to the relative inability of the author to stipulate his usage. Nevertheless, some common understanding of the key terms is usually possible. From terms we move to propositions and arguments, and here again there is no special problem if the book is a good one. But the last question, What of it?, requires considerable restraint on the part of the reader. It is here that the situation we described earlier may occur—namely, the situation in which the reader says, “I cannot fault the author’s conclusions, but I nevertheless disagree with them.” This comes about, of course, because of the prejudgments that the reader is likely to have concerning the author’s approach and his conclusions.

Reading Social Science Literature

More than once in the course of this chapter we have employed the phrase “social science literature” instead of “social science book.” The reason is that it is customary in social science to read several books about a subject rather than one book for its own sake. This is not only because social science is a relatively new field with as yet but few classic texts. It is also because when reading social science, we often have our eye primarily on *a particular matter or problem*, rather than on *a particular author or book*. We are interested in law enforcement, for example, and we read half a dozen works on the subject. Or our interest may concern race relations, or education, or taxation, or the problems of local government. Typically, there is no single, authoritative work on any of these subjects, and we must therefore read several. One sign of this is that social science authors themselves, in order to keep up with the times, must constantly bring out new, revised editions of their works; and new works supersede older ones and rapidly render them obsolete.

To some extent, a similar situation obtains in philosophy, as we have already observed. Fully to understand a philosopher, you should make some attempt to read the philosophers your author himself has read, the philosophers who have influenced him. To some extent it is also true in history, where we suggested that, if you want to discover the truth of the past, you had better read several books about it rather than one. But in those cases the likelihood that you would find one major, authoritative work was much greater. In social science that is not so common, and so the necessity of reading several works rather than one is much more urgent.

The rules of analytical reading are not in themselves applicable to the reading of several works on the same subject. They apply to each of the works that is read, of course, and if you want to read any of them well you have to observe them. But new rules of reading are required as we pass from the third level of reading (analytical reading), to the fourth (syntopical reading). We are now prepared to tackle that fourth level, having come to see, because of this characteristic of social science, the need for it.

Pointing this out makes it clear why we relegated the discussion of the social sciences to the last chapter in Part Three. It should now be clear why we organised the discussion in the way we did. We began with the reading of practical books, which are different from all others because of the special obligation to act that the reader is under if he agrees with and accepts what he is reading. We then treated fiction and poetry, which pose special problems that are unlike those of expository books. Finally, we dealt with three types of theoretical, expository writing—science and mathematics, philosophy, and social science. Social science came last because of the need to read it syntopically.

11. How to Read Imaginative, Films Literature

1. **Open How To read Fiction Books and then Imaginative Folder. Choose and decide the Book. Listen and Apply one of the chosen Books:**
 - A. **Literature & Composition_ Reading - Writing - Thinking.**
 - B. **Literature_ An Introduction to Fiction, Poetry, and Drama_Includes 1995 Mla Guidelines.**
 - C. **How To Read A Film.**
 - D. **How to Read a Film_ Movies, Media, and Beyond.**

 - F. **Reading Like a Writer_ A Guide for People Who Love Books and for Those Who Want to Write Them.**
 - G. **The Language of Composition_ Reading, Writing.**

So far, this book has been concerned with only half the reading that most people do. Even that is too liberal an estimate. Probably the greater part of anybody's reading time is spent on newspapers and magazines, and on things that have to be read in connection with one's job. And so far as books are concerned, most of us read more fiction than nonfiction. Furthermore, of the nonfiction books, the most popular are those that, like newspapers and magazines, deal journalistically with matters of contemporary interest.

We have not deceived you about the rules set forth in the preceding chapters. Before undertaking to discuss them in detail, we explained that we would have to limit ourselves to the business of reading serious nonfiction books. To have expounded the rules for reading imaginative and expository literature *at the same time* would have been confusing. But now we cannot ignore the other types of reading any longer.

Before embarking on the task, we want to emphasize one rather strange paradox. The problem of knowing how to read imaginative literature is inherently much more difficult than the problem of knowing how to read expository books. Nevertheless, it seems to be a fact that such skill is more widely possessed than the art of reading science and philosophy, politics, economics, and history. How can this be true?

It may be, of course, that people deceive themselves about their ability to read novels intelligently. From our teaching experience, we know how tongue-tied people become when asked to say what they liked about a novel. That they enjoyed it is perfectly clear to them, but they cannot give much of an account of their enjoyment or tell what the book contained that caused them pleasure. This might indicate that people can be good readers of fiction without being good critics. We suspect this is, at best, a half-truth. A critical reading of anything depends upon the fullness of one's apprehension. Those who cannot

say what they like about a novel probably have not read it below its most obvious surfaces. However, there is more to the paradox than that. Imaginative literature primarily pleases rather than teaches. It is much easier to be pleased than taught, but much harder to know *why* one is pleased. Beauty is harder to analyze than truth.

To make this point clear would require an extensive analysis of aesthetic appreciation. We cannot undertake that here. We can, however, give you some advice about how to read imaginative literature. We will proceed, first, by the *way of negation*, stating the obvious “don’ts” instead of the constructive rules. Next, we will proceed by the *way of analogy*, briefly translating the rules for reading nonfiction into their equivalents for reading fiction. Finally, in the next chapter, we will proceed to examine the problems of reading specific types of imaginative literature, namely, novels, plays, and lyric poems.

How Not to Read Imaginative Literature

In order to proceed by the way of negation, it is first of all necessary to grasp the basic differences between expository and imaginative literature. These differences will explain why we cannot read a novel as if it were a philosophical argument, or a lyric as if it were a mathematical demonstration.

The most obvious difference, already mentioned, relates to the purposes of the two kinds of writing. Expository books *try to convey knowledge*—knowledge about experiences that the reader has had or could have. Imaginative ones *try to communicate an experience itself*—one that the reader can have or share *only* by reading—and if they succeed, they give the reader something to be enjoyed. Because of their diverse intentions, the two sorts of work appeal differently to the intellect and the imagination.

We *experience* things through the exercise of our senses and imagination. To *know* anything we must use our powers of judgment and reasoning, which are intellectual. This does not mean that we can think without using our imagination, or that sense experience is ever wholly divorced from rational insight or reflection. The matter is only one of emphasis. Fiction appeals primarily to the imagination. That is one reason for calling it imaginative literature, in contrast to science and philosophy which are intellectual.

This fact about imaginative literature leads to what is probably the most important of the negative injunctions we want to suggest. *Don’t try to resist the effect that a work of imaginative literature has on you.*

We have discussed at length the importance of reading actively. This is true of all books, but it is true in quite different ways of expository works and of poetry. The reader of the former should be like a bird of prey, constantly alert, always ready to pounce. The kind of activity that is appropriate in reading poetry and fiction is not the same. It is a sort of passive action, if we may be allowed the expression, or, better, active passion. We must act in such a way, when reading a story, that we let it act on us. We must allow it to move

us, we must let it do whatever work it wants to do on us. We must somehow make ourselves open to it.

We owe much to the expository literature—the philosophy, science, mathematics — that has shaped the real world in which we live. But we could not live in this world if we were not able, from time to time, to get away from it. We do not mean that imaginative literature is always, or essentially, escapist. In the ordinary sense of that term, the idea is contemptible. If we must escape from reality, it should be to a deeper, or greater, reality. This is the reality of our inner life, of our own unique vision of the world. To discover this reality makes us happy; the experience is deeply *satisfying* to some part of ourselves we do not ordinarily touch. In any event, the rules of reading a great work of literary art should have as an end or goal just such a profound experience. The rules should clear away all that stops us from feeling as deeply as we possibly can.

The basic difference between expository and imaginative literature leads to another difference. Because of their radically diverse aims, these two kinds of writing necessarily use language differently. The imaginative writer tries to maximise the latent ambiguities of words, in order thereby to gain all the richness and force that is inherent in their multiple meanings. He uses metaphors as the units of his construction just as the logical writer uses words sharpened to a single meaning. What Dante said of *The Divine Comedy*, that it must be read as having several distinct though related meanings, generally applies to poetry and fiction. The logic of expository writing aims at an ideal of unambiguous explicitness. Nothing should be left between the lines. Everything that is relevant and statable should be said as explicitly and clearly as possible. In contrast, imaginative writing relies as much upon what is implied as upon what is said. The multiplication of metaphors puts almost more content between the lines than in the words that compose them. The whole poem or story says something that none of its words say or can say.

From this fact we obtain another negative injunction. *Don't look for terms, propositions, and arguments in imaginative literature.* Such things are logical, not poetic, devices. "In poetry and in drama," the poet Mark Van Doren once observed, "statement is one of the obscurer mediums." What a lyric poem "states," for instance, cannot be found in any of its sentences. And the whole, comprising all its words in their relations to and reactions upon each other, says something that can never be confined within the straitjacket of propositions. (However, imaginative literature contains elements that are *analogous* to terms, propositions, and arguments, and we will discuss them in a moment.)

Of course, we can learn from imaginative literature, from poems and stories and especially, perhaps, plays—but not in the same way as we are taught by scientific and philosophical books. We learn from experience—the experience that we have in the course of our daily lives. So, too, we can learn from the vicarious, or artistically created, experiences that fiction produces in our imagination. In this sense, poems and stories teach as well as please. But the sense in which science and philosophy teach us is different. Expository works do not provide us with novel experiences. They comment on such experiences as we already have or can get. That is why it seems right to say that expository books teach primarily, while imaginative books teach only derivatively, by

creating experiences from which we can learn. In order to learn from such books, we have to do our own thinking about experience; in order to learn from scientists and philosophers, we must first try to understand the thinking they have done.

Finally, one last negative rule. *Don't criticise fiction by the standards of truth and consistency that properly apply to communication of knowledge.* The "truth" of a good story is its verisimilitude, its intrinsic probability or plausibility. It must be a likely story, but it need not describe the facts of life or society in a manner that is verifiable by experiment or research. Centuries ago, Aristotle remarked that "the standard of correctness is not the same in poetry as in politics," or in physics or psychology for that matter. Technical inaccuracies about anatomy or errors in geography or history should be criticized when the book in which they occur offers itself as a treatise on those subjects. But misstatements of fact do not mar a story if its teller succeeds in surrounding them with plausibility. When we read history, we want the truth in some sense, and we have a right to complain if we do not get it. When we read a novel we want a story that must be true only in the sense that it *could have happened* in the world of characters and events that the novelist has created, and re-created in us.

What do we do with a philosophical book, once we have read it and understood it? We test it—against the common experience that was its original inspiration, and that is its only excuse for being. We say, is this true? Have we felt this? Have we always thought this without realizing it? Is this obvious now, though it was not previously? Complicated as the author's theory or explanation may be, is it actually simpler than the chaotic ideas and opinions we had about this subject before?

If we can answer most of these questions in the affirmative, then we are bound by the community of understanding that is between ourselves and the author. When we understand and do not disagree, we must say, "This is our common sense of the matter. We have tested your theory and found it correct."

Not so with poetry. We cannot test *Othello*, say, against our own experience, unless we too are Moors and wedded to Venetian ladies whom we suspect of treachery. But even if this were so, Othello is not every Moor, and Desdemona is not every Venetian lady; and most such couples would have the good fortune not to know an Iago. In fact, all but one would be so fortunate; Othello, the character as well as the play, is unique.

General Rules for Reading Imaginative Literature

To make the "don'ts" discussed in the last section more helpful, they must be supplemented by constructive suggestions. These suggestions can be developed by analogy from the rules of reading expository works.

There are, as we have seen, three groups of such rules. The first group consists of rules for discovering the unity and part-whole structure; the second consists of rules for identifying and interpreting the book's component terms, propositions, and arguments; the

third consists of rules for criticizing the author's doctrine so that we can reach intelligent agreement or disagreement with him. We called these three groups of rules structural, interpretive, and critical. By analogy, we can find similar sets of rules to guide us in reading poems, novels, and plays.

First, we can translate the structural rules—the rules of outlining—into their fictional analogues as follows.

(1) You must classify a work of imaginative literature according to its kind. A lyric tells its story primarily in terms of a single emotional experience, whereas novels and plays have much more complicated plots, involving many characters, their actions and their reactions upon one another, as well as the emotions they suffer in the process. Everyone knows, furthermore, that a play differs from a novel by reason of the fact that it narrates entirely by means of actions and speeches.

(There are some interesting exceptions to this, which we will mention later.) The playwright can never speak in his own person, as the novelist can, and frequently does, in the course of a novel. All of these differences in manner of writing call for differences in the reader's receptivity. Therefore, you should recognise at once the kind of fiction you are reading.

(2) You must grasp the unity of the whole work. Whether you have done this or not can be tested by whether you are able to express that unity in a sentence or two. The unity of an expository work resides ultimately in the main problem that it tries to solve. Hence its unity can be stated by the formulation of this question, or by the propositions that answer it. The unity of fiction is also connected with the problem the author has faced, but we have seen that that problem is the attempt to convey a concrete experience, and so *the unity of a story is always in its plot*. You have not grasped the whole story until you can summarize its plot in a brief narration—not a proposition or an argument. Therein lies its unity.

Note that there is no real contradiction here between what we have just said about the unity of plot and what we said about the uniqueness of the language of a fictional work. Even a lyric has a "plot" in the sense in which we are using the term here. But the plot is not the concrete experience that is re-created in the reader by the work, be it lyric, play, or novel; it is only the framework of it, or perhaps the occasion of it. It stands for the unity of the work, which is properly in the experience itself, just as the logical summation of the meaning of an expository work stands for the argument of the whole.

(3) You must not only reduce the whole to its simplest unity, but you must also discover how that whole is constructed out of all its parts. The parts of an expository book are concerned with parts of the whole problem, the partial solutions contributing to the solution of the whole. The parts of fiction are the various steps that the author takes to develop his plot—the details of characterisation and incident. The way in which the parts are arranged differs in the two cases. In science and philosophy, they must be ordered logically. In a story, the parts must somehow fit into a temporal scheme, a progress from a beginning through the middle to its end. To know the structure of a narrative, you must know where it begins—which is not necessarily on the first page, of course—what it goes through, and where it comes out at. You must know the various crises that lead up to the climax, where and how the climax occurs, and what happens in the aftermath. (By

“aftermath” we do not mean what happens after the story is over. Nobody can know that. We mean only what happens, within the narrative, after the climax has occurred.)

An important consequence follows from the points we have just made. The parts or sub-wholes of an expository book are more likely to be independently readable than the parts of fiction. Euclid published his *Elements* in thirteen parts, or books, as he called them, and the first of them can be read by itself. That is more or less the case with every well-organized expository book. Its sections or chapters, taken separately or in subgroups, make sense. But the chapters of a novel, the acts of a play, or the verses of a lyric often become relatively meaningless when wrenched from the whole.

Second, what are the interpretive rules for reading fiction? Our prior consideration of the difference between a poetic and a logical use of language prepares us to make a translation of the rules that direct us to find the terms, the propositions, and the arguments. We know we should not do that, but we must do something analogous to it.

(1) The elements of fiction are its episodes and incidents, its characters, and their thoughts, speeches, feelings, and actions. Each of these is an element in the world the author creates. By manipulating these elements, the author tells his story. They are like the terms in logical discourse. Just as you must come to terms with an expository writer, so here you must become acquainted with the details of incident and characterization. You have not grasped a story until you are familiar with its characters, until you have lived through its events.

(2) Terms are connected in propositions. The elements of fiction are connected by the total scene or background against which they stand out in relief. The imaginative writer, we have seen, creates a world in which his characters “live, move, and have their being.” The fictional analogue of the rule that directs you to find the author’s propositions can, therefore, be stated as follows: become at home in this imaginary world; know it as if you were an observer on the scene; become a member of its population, willing to befriend its characters, and able to participate in its happenings by sympathetic insight, as you would do in the actions and sufferings of a friend. If you can do this, the elements of fiction will cease to be so many isolated pawns moved about mechanically on a chessboard. You will have found the connections that vitalize them into members of a living society.

(3) If there is any motion in an expository book, it is the movement of the argument, a logical transition from evidences and reasons to the conclusions they support. In the reading of such books, it is necessary to follow the argument. Hence, after you have discovered its terms and propositions, you are called upon to analyze its reasoning. There is an analogous last step in the interpretive reading of fiction. You have become acquainted with the characters. You have joined them in the imaginary world wherein they dwell, consented to the laws of their society, breathed its air, tasted its food, traveled its highways. Now you must follow them through their adventures. The scene or background, the social setting, is (like the proposition) a kind of *static* connection of the elements of fiction. The unraveling of the plot (like the arguments or reasoning) is the dynamic

connection. Aristotle said that plot is the soul of a story. It is its life. To read a story well you must have your finger on the pulse of the narrative, be sensitive to its very beat.

Before leaving these fictional equivalents for the interpretive rules of reading, we must caution you not to examine the analogy too closely. An analogy of this sort is like a metaphor that will disintegrate if you press it too hard. The three steps we have suggested outline the way in which one becomes progressively aware of the artistic achievement of an imaginative writer. Far from spoiling your enjoyment of a novel or play, they should enable you to enrich your pleasure by knowing intimately the sources of your delight. You will not only know *what* you like but also *why* you like it.

One other caution: the foregoing rules apply mainly to novels and plays. To the extent that lyric poems have some narrative line, they apply to lyrics also. But the rules do not cease to apply to non-narrative lyrics, although the connection is much less close. A lyric is the representation of a concrete experience, just like a long story, and it attempts to re-create that experience in the reader. There is a beginning, middle, and end of even the shortest lyric, just as there is a temporal sequence in any experience, no matter how brief and fleeting. And though the cast of characters may be very small in a short lyric, there is always at least one character—namely, the speaker of the poem.

Third, and last, what are the critical rules for reading fiction? You may remember that we distinguished, in the case of expository works, between the general maxims governing criticism and a number of particular points—specific critical remarks. With respect to the general maxims, the analogy can be sufficiently drawn by one translation. Where, in the case of expository works, the advice was not to criticize a book—not to say you agree or disagree—until you can first say you understand, so here the maxim is: *don't criticize imaginative writing until you fully appreciate what the author has tried to make you experience*.

There is an important corollary to this. The good reader of a story does not question the world that the author creates—the world that is re-created in himself. “We must grant the artist his subject, his idea, his *donné*,” said Henry James in *The Art of Fiction*; “our criticism is applied only to what he makes of it.” That is, we must merely appreciate the fact that a writer sets his story in, say, Paris, and not object that it would have been better to set it in Minneapolis; but we have a right to criticize what he does with his Parisians and with the city itself.

In other words, we must remember the obvious fact that we do not agree or disagree with fiction. We either like it or we do not. Our critical judgment in the case of expository books concerns their *truth*, whereas in criticizing belles-lettres, as the word itself suggests, we consider chiefly their *beauty*. The beauty of any work of art is related to the pleasure it gives us when we know it well.

Let us restate the maxims, then, in the following manner. Before you express your likes and dislikes, you must first be sure that you have made an honest effort to appreciate the work. By appreciation, we mean having the experience that the author tried to produce

for you by working on your emotions and imagination. Thus, you cannot *appreciate* a novel by reading it passively (indeed, as we have remarked, you must read it passionately) any more than you can *understand* a philosophical book that way. To achieve appreciation, as to achieve understanding, you must read actively, and that means performing all the acts of analytical reading that we have briefly outlined.

After you have completed such a reading, you are competent to judge. Your first judgment will naturally be one of taste. You will say not only *that* you like or dislike the book, but also *why*. The reasons you give will, of course, have some critical relevance to the book itself, but in their first expression they are more likely to be about you—your preferences and prejudices—than about the book. Hence, to complete the task of criticism, you must objectify your reactions by pointing to those things in the book that caused them. You must pass from saying what *you* like or dislike and why, to saying what is good or bad about the *book* and why.

The better you can reflectively discern the causes of your pleasure in reading fiction or poetry, the nearer you will come to knowing the artistic virtues in the literary work itself. You will thus gradually develop a standard of criticism. And you will probably find a large company of men and women of similar taste to share your critical judgments. You may even discover, what we think is true, that good taste in literature is acquired by anyone who learns to read.

The parallel rules for reading imaginative literature that were discussed in the last chapter were general ones, applying across the board to all kinds of imaginative literature—novels and stories, whether in prose or verse (including epics); plays, whether tragedies or comedies or something in between; and lyric poems, of whatever length or complexity.

These rules, being general, must be adapted somewhat when they are applied to the different kinds of imaginative literature. In this chapter we want to suggest the adaptations that are required. We will have something particular to say about the reading of stories, plays, and lyric poems, and we will also include notes on the special problems presented by the reading of epic poems and the great Greek tragedies.

Before proceeding to those matters, however, it is desirable to make some remarks about the last of the four questions that the active and demanding reader must ask of any book, when that question is asked of a work of imaginative literature.

You will recall that the first three questions are: first, What is the book about as a whole?; second, What is being said in detail, and how?; and third, Is the book true, in whole or part? The application of these three questions to imaginative literature was covered in the last chapter. The first question is answered when you are able to describe the unity of the plot of a story, play, or poem—"plot" being construed broadly to include the action or movement of a lyric poem as well as of a story. The second question is answered when you are able to discern the role that the various characters play, and recount, in your own words, the key incidents and events in which they are involved. And the third question is answered when you are able to give a reasoned judgment about the poetical truth of the work. Is it a likely story? Does the work satisfy your heart and your mind? Do you appreciate the beauty of the work? In each case, can you say why?

The fourth question is, What of it? In the case of expository books, an answer to this question implies some kind of action on your part. "Action," here, does not always mean going out and doing something. We have suggested that that kind of action is an obligation for the reader when he agrees with a practical work—that is, agrees with the ends proposed—and accepts as appropriate the means by which the author says they can be attained. Action in this sense is not obligatory when the expository work is theoretical. There, mental action alone is required. But if you are convinced that such a book is true, in whole or part, then you must agree with its conclusions, and if they imply some adjustment of your views of the subject, then you are more or less required to make those adjustments.

Now it is important to recognize that, in the case of a work of imaginative literature, this fourth and final question must be interpreted quite differently. In a sense, the question is irrelevant to the reading of stories and poems. Strictly speaking, no action whatever is called for on your part when you have read a novel, play, or poem well—that is, analytically. You have discharged all of your responsibilities as a reader when you have applied the parallel rules of analytical reading to such works, and answered the first three questions.

We say "strictly speaking," because it is obvious that imaginative works have often led readers to act in various ways. Sometimes a story is a better way of getting a point across—be it a political, economic, or moral point—than an expository work making the same point. George Orwell's *Animal Farm* and his *1984* are both powerful attacks on totalitarianism. Aldous Huxley's *Brave New World* is an eloquent diatribe against the tyranny of technological progress. Alexander Solzhenitsyn's *The First Circle* tells us more about the petty cruelty and inhumanity of the Soviet bureaucracy than a hundred factual studies and reports. Such works have been banned and censored many times in the history of mankind, and the reason for that is clear. As E. B. White once remarked, "A despot doesn't fear eloquent writers preaching freedom—he fears a drunken poet who may crack a joke that will take hold."

Nevertheless, such practical consequences of the reading of stories and poems are not of the essence of the matter. Imaginative writings *can* lead to action, but they do not *have to*. They belong in the realm of fine art.

A work of fine art is “fine” not because it is “refined” or “finished,” but because it is an end (*finis*, Latin, means end) in itself. It does not move toward some result beyond itself. It is, as Emerson said of beauty, its own excuse for being.

Therefore, when it comes to applying this last question to works of imaginative literature, you should do so with caution. If you feel impelled because of a book you have read to go out and do something, ask yourself whether the work contains some implied statement that has produced this feeling. Poetry, properly speaking, is not the realm of statement, although many stories and poems have statements in them, more or less deeply buried. And it is quite right to take heed of them, and to react to them. But you should remember that you are then taking heed of and reacting to something other than the story or poem itself. That subsists in its own right. To read it well, all you have to do is experience it.

13. How to Read Stories

- 1. Open How To read Fiction Books and Stories, Plays and Poems Folder. Choose and decide the Book. Listen and Apply one of the chosen Books:**

The first piece of advice we would like to give you for reading a story is this: Read it quickly and with total immersion. Ideally, a story should be read at one sitting, although this is rarely possible for busy people with long novels. Nevertheless, the ideal should be approximated by compressing the reading of a good story into as short a time as feasible. Otherwise you will forget what happened, the unity of the plot will escape you, and you will be lost.

Some readers, when they really like a novel, want to savor it, to pause over it, to draw out the reading of it for as long as they can. But in this case they are probably not so much reading the book as satisfying their more or less unconscious feelings about the events and the characters. We will return to that in a moment.

Read quickly, we suggest, and with total immersion. We have indicated the importance of letting an imaginative book work on you. That is what we mean by the latter phrase. Let the characters into your mind and heart; suspend your disbelief, if such it is, about the events. Do not disapprove of something a character does before you understand why he does it—if then. Try as hard as you can to live in his world, not in yours; there, the things he does may be quite understandable. And do not judge the world as a whole until you are sure that you have “lived” in it to the extent of your ability.

Following this rule will allow you to answer the first question you should ask about any book—What is it about, as a whole? Unless you read it quickly you will fail to see the unity of the story. Unless you read intensely you will fail to see the details.

The terms of a story, as we have observed, are its characters and incidents. You must become acquainted with them, and be able to sort them out. But here a word of warning. To take *War and Peace* as an example, many readers start this great novel and are overwhelmed by the vast number of characters to whom they are introduced, especially since they all have strange-sounding names. They soon give up on the book in the belief that they will never be able to sort out all the complicated relationships, to know who is who. This is true of any big novel—and if a novel is really good, we want it to be as big as possible.

It does not always occur to such fainthearted readers that exactly the same thing happens to them when they move to a new town or part of a town, when they go to a new school or job, or even when they arrive at a party. They do not give up in those circumstances; they know that after a short while individuals will begin to be visible in the mass, friends will emerge from the faceless crowd of fellow-workers, fellow-students, or fellow-guests. We may not remember the names of everyone we met at a party, but we will recall the name of the man we talked to for an hour, or the girl with whom we made a date for the next evening, or the mother whose child goes to the same school as ours. The same thing happens in a novel. We should not expect to remember every character; many of them are merely background persons, who are there only to set off the actions of the main characters. However, by the time we have finished *War and Peace* or any big novel, we know who is important, and we do not forget. Pierre, Andrew, Natasha, Princess Mary, Nicholas—the names are likely to come immediately to memory, although it may have been years since we read Tolstoy’s book.

We also, despite the plethora of incidents, soon learn *what* is important. Authors generally give a good deal of help in this respect; they do not want the reader to miss what is essential to the unfolding of the plot, so they flag it in various ways. But our point is that you should not be anxious if all is not clear from the beginning. Actually, it should *not* be clear then. A story is like life itself; in life, we do not expect to understand events as they occur, at least with total clarity, but looking back on them, we do understand. So the reader of a story, looking back on it after he has finished it, understands the relation of events and the order of actions.

All of this comes down to the same point: you must finish a story in order to be able to say that you have read it well. Paradoxically, however, a story ceases to be like life on its last page. Life goes on, but the story does not. Its characters have no vitality outside the book, and your imagination of what happens to them before the first page and after the last is only as good as the next reader's. Actually, all such speculations are meaningless. Preludes to *Hamlet* have been written, but they are ridiculous. We should not ask what happens to Pierre and Natasha after *War and Peace* ends. We are satisfied with Shakespeare's and Tolstoy's creations partly because they are limited in time. We need no more.

The great majority of books that are read are stories of one kind or another. People who cannot read listen to stories. We even make them up for ourselves. Fiction seems to be a necessity for human beings. Why is this?

One reason why fiction is a human necessity is that it satisfies many unconscious as well as conscious needs. It would be important if it only touched the conscious mind, as expository writing does. But fiction is important, too, because it also touches the unconscious.

On the simplest level—and a discussion of this subject could be very complex— we like or dislike certain kinds of people more than others, without always being sure why. If, in a novel, such people are rewarded or punished, we may have stronger feelings, either pro or con, about the book than it merits artistically.

For example, we are often pleased when a character in a novel inherits money, or otherwise comes into good fortune. However, this tends to be true only if the character is "sympathetic"—meaning that we can identify with him or her. We do not admit to ourselves that we would like to inherit the money, we merely say that we like the book.

Perhaps we would all like to love more richly than we do. Many novels are about love—most are, perhaps—and it gives us pleasure to identify with the loving characters. They are free, and we are not. But we may not want to admit this; for to do so might make us feel, consciously, that our own loves are inadequate.

Again, almost everyone has some unconscious sadism and masochism in his makeup. These are often satisfied in novels, where we can identify with either the conqueror or victim, or even with both. In each case, we are prone to say simply that we like "that kind of book"—without specifying or really knowing why.

Finally, we suspect that life as we know it is unjust. Why do good people suffer, and bad ones prosper? We do not know, we cannot know, but the fact causes great anxiety in everyone. In stories, this chaotic and unpleasant situation is adjusted, and that is extremely satisfying to us.

In stories—in novels and narrative poems and plays—justice usually does exist. People get what they deserve; the author, who is like a god to his characters, sees to it that they are rewarded or punished according to their true merit. In a good story, in a satisfying one, this is usually so, at least. One of the most irritating things about a bad story is that the people in it seem to be punished or rewarded with no rhyme or reason.

The great storyteller makes no mistakes. He is able to convince us that justice—poetic justice, we call it—has been done.

This is true even of high tragedy. There, terrible things happen to good men, but we see that the hero, even if he does not wholly deserve his fate, at least comes to understand it. And we have a profound desire to share his understanding. If we only *knew*—then we could withstand whatever the world has in store for us. “I Want to Know Why” is the title of a story by Sherwood Anderson. It could be the title of many stories. The tragic hero does learn why, though often, of course, only after the ruin of his life. We can share his insight without sharing his suffering.

Thus, in criticizing fiction we must be careful to distinguish those books that satisfy our own particular unconscious needs—the ones that make us say, “I like this book, although I don’t really know why”—from those that satisfy the deep unconscious needs of almost everybody. The latter are undoubtedly the great stories, the ones that live on and on for generations and centuries. As long as man is man, they will go on satisfying him, giving him something that he needs to have—a belief in justice and understanding and the allaying of anxiety. We do not know, we cannot be sure, that the real world is good. But the world of a great story *is* somehow good. We want to live there as often and as long as we can.

A Note About Epics

Perhaps the most honored but probably the least read books in the great tradition of the Western World are the major epic poems, particularly the *Iliad* and *Odyssey* of Homer, Virgil's *Aeneid*, Dante's *Divine Comedy*, and Milton's *Paradise Lost*. This paradox requires some comment.

Judging by the very small number that have been completed successfully in the past 2,500 years, a long epic poem is apparently the most difficult thing a man can write. This is not for want of trying; hundreds of epics have been begun, and some—for example, Wordsworth's *Prelude* and Byron's *Don Juan*—have grown to extensive proportions without ever really being finished. So honor is due the poet who sticks to the task and completes it. Greater honor is due him if he produces a work that has the qualities of the five just mentioned. But they are certainly not easy to read.

This is not only because they are written in verse—for in every case except that of *Paradise Lost*, prose translations are available to us. The difficulty seems rather to lie in their elevation, in their approach to their subject matter. Any of these major epics exerts enormous demands on the reader—demands of attention, of involvement, and of imagination. The effort required to read them is very great indeed.

Most of us are not aware of the loss we suffer by not making that effort. For the rewards to be gained from a good reading—an analytical reading, as we should say—of these epics are at least as great as those to be gained from the reading of any other books, certainly any other works of fiction. Unfortunately, however, these rewards are not gained by readers who do less than a good job on these books.

We hope that you will take a stab at reading these five great epic poems, and that you will manage to get through all of them. We are certain you will not be disappointed if you do. And you will be able to enjoy a further satisfaction. Homer, Virgil, Dante, and Milton—they are the authors that every good poet, to say nothing of other writers, has read. Along with the Bible, they constitute the backbone of any serious reading program.

A play is fiction, a story, and insofar as that is true, it should be read like a story. Perhaps the reader has to be more active in creating the background, the world in which the characters live and move, for there is no description in plays such as abounds in novels. But the problems are essentially similar.

However, there is one important difference. When you read a play, you are not reading a *complete* work. The complete play (the work that the author intended you to apprehend) is only apprehended when it is acted on a stage. Like music, which must be heard, a play lacks a physical dimension when we read it in a book. The reader must supply that dimension.

The only way to do that is to make a pretense of seeing it acted. Therefore, once you have discovered what the play is about, as a whole and in detail, and once you have answered the other questions you must ask about any story, then try *directing* the play.

Imagine that you have half a dozen good actors before you, awaiting your commands. Tell them how to say this line, how to play that scene. Explain the importance of these few words, and how that action is the climax of the work. You will have a lot of fun, and you will learn a lot about the play.

An example will show what we mean. In *Hamlet*, Act II, Scene ii, Polonius announces to the king and queen that Hamlet is insane because of his love for Ophelia, who has spurned the prince's advances. The king and queen are doubtful, whereupon Polonius proposes that the king and he hide behind an arras, in order to overhear a conversation between Hamlet and Ophelia. This proposal occurs in Act II, Scene ii, at lines 160–170; immediately thereafter Hamlet enters, reading. His speeches to Polonius are enigmatic; as Polonius says, “though this be madness, yet there is method in’t!” Later on, early in Act III, Hamlet enters and delivers the famous soliloquy, beginning “To be or not to be,” and then is interrupted by catching sight of Ophelia. He speaks to her quite reasonably for a time, but suddenly he cries: “Ha, ha! are you honest?” (III, i, line 103). Now the question is, has Hamlet overheard Polonius say earlier that he and the king planned to spy on him? And did he perhaps also hear Polonius say that he would “loose my daughter to him”? If so Hamlet's conversations with both Polonius and Ophelia would mean one thing; if he did not overhear the plotting, they would mean another. Shakespeare left no stage directions; the reader (or director) must decide for himself. Your own decision will be central to your understanding of the play.

Many of Shakespeare's plays require this kind of activity on the part of the reader. Our point is that it is always desirable, no matter how explicit the playwright was in telling us exactly what we should expect to see. (We cannot question what we are to hear, since the play's words are before us.) Probably you have not read a play really well until you have pretended to put it on the stage in this way. At best, you have given it only a partial reading.

Earlier, we suggested that there were interesting exceptions to the rule that the playwright cannot speak directly to the reader as the author of a novel can and often does. (Fielding, in *Tom Jones*, is an example of this direct addressing of the reader in one great novel.) Two of these exceptions are separated by nearly twenty-five centuries of time. Aristophanes, the ancient Greek comic playwright, wrote the only examples of what is called Old Comedy that survive. From time to time in an Aristophanic play, and always at least once, the leading actor would step out of character, perhaps move forward toward the audience, and deliver a political speech that had nothing whatever to do with the action of the drama. It is felt that these speeches were expressions of the author's personal feelings. This is occasionally done nowadays—no useful artistic device is ever really lost—but perhaps not as effectively as Aristophanes did it.

The other example is that of Shaw, who not only expected his plays to be acted but also hoped that they would be read. He published them all, at least one (*Heartbreak House*) before it was ever acted, and accompanied the publication with long prefaces in which he explained the meaning of the plays and told his readers how to understand them. (He also included very extensive stage directions in the published versions.) To read a

Shavian play without reading the preface Shaw wrote for it is to turn one's back intentionally on an important aid to understanding. Again, other modern playwrights have imitated Shaw in this device, but never as effectively as he did.

One other bit of advice may be helpful, particularly in reading Shakespeare. We have already suggested the importance of reading the plays through, as nearly as possible at one sitting, in order to get a feel for the whole. But, since the plays are mostly in verse, and since the verse is more or less opaque in places because of changes in the language that have occurred since 1600, it is often desirable to read a puzzling passage out loud. Read slowly, as if an audience were listening, and with "expression"—that is, try to make the words meaningful to you as you read them. This simple device will clear up many difficulties. Only after it has failed should you turn to the glossary or notes.

A Note About Tragedy

Most plays are not worth reading. This, we think, is because they *are* incomplete. They were not meant to be read—they were meant to be acted. There are many great expository works, and many great novels, stories, and lyric poems, but there are only a few great plays. However, those few—the tragedies of Aeschylus, Sophocles, and Euripides, the plays of Shakespeare, Molière's comedies, the works of a very few moderns—are very great indeed, for they contain within them some of the deepest and richest insights men have ever expressed in words.

Among these, Greek tragedy is probably the toughest nut to crack for beginning readers. For one thing, in the ancient world three tragedies were presented at one time, the three often dealing with a common theme, but except in one case (the *Oresteia* of Aeschylus) only single plays (or acts) survive. For another, it is almost impossible to stage the plays mentally, since we know almost nothing about how the Greek directors did it. For still another, the plays often are based on stories that were well known to their audiences but are known to us only through the plays. It is one thing to know the story of Oedipus, for example, as well as we know the story of George Washington and the Cherry Tree, and thus to view Sophocles' masterpiece as a commentary on a familiar tale; and it is quite another to see *Oedipus Rex* as the primary story and try to imagine the familiar tale that provided the background.

Nevertheless, the plays are so powerful that they triumph over even these obstacles, as well as others. It is important to read them well, for they not only can tell us much about life as we still live it, but they also form a kind of literary framework for many other plays written much later—for example, Racine's and O'Neill's. We have two bits of advice that may help.

The first is to remember that the essence of tragedy is time, or rather the lack of it. There is no problem in any Greek tragedy that could not have been solved if there had been enough time, but there is never enough. Decisions, choices have to be made in a moment, there is no time to think and weigh the consequences; and, since even tragic

heroes are fallible—especially fallible, perhaps—the decisions are wrong. It is easy for us to see what should have been done, but would we have been able to see in time? That is the question that you should always ask in reading any Greek tragedy.

The second bit of advice is this. One thing we do know about the staging of Greek plays is that the tragic actors wore buskins on their feet that elevated them several inches above the ground. (They also wore masks.) But the members of the chorus did not wear buskins, though they sometimes wore masks. The comparison between the size of the tragic protagonists, on the one hand, and the members of the chorus, on the other hand, was thus highly significant. Therefore you should always imagine, when you read the words of the chorus, that the words are spoken by persons of your own stature; while the words spoken by the protagonists proceed from the mouths of giants, from personages who did not only seem, but actually were, larger than life.

 - O. Writing Poetry.**

The simplest definition of poetry (in the somewhat limited sense implied by the title of this section) is that it is what poets write. That seems obvious enough, and yet there are those who would dispute the definition. Poetry, they hold, is a kind of spontaneous overflowing of the personality, which may be expressed in written words but may also take the form of physical action, or more or less musical sound, or even just feeling. There is something to this, of course, and poets have always recognised it. It is a very old notion that the poet reaches down deep into himself to produce his poems, that their place of origin is a mysterious "well of creation" within the mind or soul. In this sense of the term, poetry can be made by anyone at any time, in a kind of solitary sensitivity session. But although we admit that there is a kernel of truth in this definition, the meaning of the term that we will be employing in what follows is much narrower. Whatever may be the origin of the poetic impulse, poetry, for us, consists of words, and what is more, of words that are arranged in a more or less orderly and disciplined way.

Other definitions of the term that similarly contain a kernel of truth are that poetry (again, primarily lyric poetry) is not truly poetry unless it praises, or unless it rouses to action (usually revolutionary), or unless it is written in rhyme, or unless it employs a specialized language that is called “poetic diction.” In that sentence we have intentionally mixed together some very modern and some very antiquated notions. Our point is that all of these definitions, and a dozen more that we might mention, are too narrow, just as the definition discussed in the last paragraph was too broad (for us).

Between such very broad and such very narrow definitions lies a central core that most people, if they were feeling reasonable about the matter, would admit was poetry. If we tried to state precisely what the central core consisted in, we would probably get into trouble, and so we will not try. Nevertheless, we are certain that you know what we mean. We are certain that nine times out of ten, or perhaps even ninety-nine times out of a hundred, you would agree with us that X was a poem and Y was not. And that is fully sufficient for our purposes in the following pages.

Many people believe that they cannot read lyric poetry—especially modern poetry. They think that it is often difficult, obscure, complex, and that it demands so much attention, so much work on their part, that it is not worthwhile. We would say two things. First, lyric poetry, even modern poetry, does not always demand as much work as you may think if you go about reading it in the right way. Second, it is often worth whatever effort you are willing to spend.

We do not mean that you should not work on a poem. A good poem can be worked at, re-read, and thought about over and over for the rest of your life. You will never stop finding new things in it, new pleasures and delights, and also new ideas about yourself and the world. We mean that the initial task of bringing a poem close enough to you to work on it is not as hard as you may have believed.

The first rule to follow in reading a lyric is to read it through without stopping, whether you think you understand it or not. This is the same rule that we have suggested for many different kinds of books, but it is more important for a poem than it is for a philosophical or scientific treatise, and even for a novel or play.

In fact, the trouble so many people seem to have in reading poems, especially the difficult modern ones, stems from their unawareness of this first rule of reading them. When faced by a poem of T. S. Eliot or Dylan Thomas or some other “obscure” modern, they plunge in with a will, but are brought up short by the first line or stanza. They do not understand it immediately and in its entirety, and they think they should. They puzzle over the words, try to unwind the complicated skein of the syntax, and soon give up, concluding that, as they suspected, modern poetry is just too difficult for them.

It is not only modern lyrics that are difficult. Many of the best poems in the language are complicated and involved in their language and thought. Besides, many apparently simple poems have immense complexity under the surface.

But any good lyric poem has a unity. Unless we read all of it, and all at once, we cannot comprehend its unity. We cannot discover, except possibly by accident, the basic feeling or experience that underlies it. In particular, the essence of a poem is almost never to be found in its first line, or even in its first stanza. It is to be found only in the whole, and not conclusively in any part.

The second rule for reading lyrics is this: Read the poem through again—but read it *out loud*. We have suggested this before, in the case of poetic dramas like Shakespeare's. There it was helpful; here it is essential. You will find, as you read the poem out loud, that the very act of speaking the words forces you to understand them better. You cannot glide over a misunderstood phrase or line quite so easily if you are speaking it. Your ear is offended by a misplaced emphasis that your eyes might miss. And the rhythm of the poem, and its rhymes, if it has them, will help you to understand by making you place the emphasis where it belongs. Finally, you will be able to open yourself to the poem, and let it work on you, as it should.

In the reading of lyrics, these first two suggestions are more important than anything else. We think that if readers who believe they cannot read poems would obey these rules first, they would have little difficulty afterwards. For once you have apprehended a poem in its unity, even if this apprehension is vague, you can begin to ask it questions. And as with expository works, that is the secret of understanding.

The questions you ask of an expository work are grammatical and logical. The questions you ask of a lyric are usually rhetorical, though they may also be syntactical. You do not come to terms with a poem; but you must discover the key words. You discover them not primarily by an act of grammatical discernment, however, but by an act of rhetorical discernment. Why do certain words pop out of the poem and stare you in the face? Is it because the rhythm marks them? Or the rhyme? Or are the words repeated? Do several stanzas seem to be about the same ideas; if so, do these ideas form any kind of sequence? Anything of this sort that you can discover will help your understanding.

In most good lyrics there is some kind of conflict. Sometimes two antagonists— either individual people, or images, or ideas—are named, and then the conflict between them is described. If so, this is easy to discover. But often the conflict is only implied and not stated. For example, a large number of great lyric poems—perhaps even the majority of them—are about the conflict between love and time, between life and death, between the beauty of transient things and the triumph of eternity. But these words may not be mentioned in the poem itself.

It has been said that almost all of Shakespeare's sonnets are about the ravages of what he calls "Devouring time." It is clear that some of them are, for he explicitly says so again and again.

*When I have seen by
Time's fell hand
defaced The rich-proud
cost of outworn buried
age*

he writes in the 64th sonnet and lists other victories that time gains over all that man wishes were proof against it. Then he says:

*Ruin hath taught me thus to ruminare,
That Time will come and take my love away.*

There is no question what that sonnet is about. Similarly with the famous 116th sonnet, which contains these lines:

*Love's not Time's fool, though rosy lips and cheeks
Within his bending sickle's compass come;
Love alters not with his brief hours and weeks,
But bears it out even to the edge of doom.*

But the almost equally famous 138th sonnet, which begins with the lines:

*When my love swears
that she is made of truth
I do believe her, though
I know she lies, is also
about the conflict
between love and time,
although the word "time"
appears nowhere in the
poem.*

That you will see without much difficulty. Nor is there any difficulty in seeing that Marvell's celebrated lyric "To His Coy Mistress" is about the same subject, for he makes this clear right at the beginning:

*Had we but world enough, and time,
This coyness, lady, were no crime.*

We do not have all the time in the world, Marvell says—for

*. . . at my back I always hear
Time's wingèd chariot hurrying near;
And yonder all before us lie
Deserts of vast eternity.*

Therefore, he adjures his mistress,

*Let us roll all our strength and all
Our sweetness up into one ball,
And tear our pleasures with rough strife
Thorough the iron gates of life.
Thus, though we cannot make our sun
Stand still, yet we will make him run.*

It is perhaps a bit harder to see that the subject of “You, Andrew Marvell,” by Archibald MacLeish, is exactly the same. The poem begins:

*And here face down beneath the sun
And here upon earth's noonward height
To feel the always coming on
The always rising of the night*

Thus MacLeish asks us to imagine someone (the poet? the speaker? the reader?) as lying in the noonday sun—but all the same, in the midst of that brightness and warmth, aware of “the earthly chill of dusk.” He imagines the line of the shadow of the setting sun—of all the cumulative successive setting suns of history—moving across the world, across Persia, and Baghdad . . . he feels “Lebanon fade out and Crete,” “And Spain go under and the shore / Of Africa the gilded sand,” and . . . “now the long light on the sea” vanishes, too. And he concludes:

*And here face downward in the sun
To feel how swift, how secretly,
The shadow of the night comes on. . . .*

The word “time” is not used in the poem, nor is there any mention of a lover. Nevertheless, the title reminds us of Marvell's lyric with its theme of “Had we but world enough and time,” and thus the combination of the poem itself and its title invokes the same conflict, between love (or life) and time, that was the subject of the other poems we have considered here.

One final piece of advice about reading lyric poems. In general, readers of such works feel that they must know more about the authors and their times than they really have to. We put much faith in commentaries, criticism, biographies—but this may be only because we doubt our own ability to read. Almost everyone can read any poem, if he will go to work on it. Anything you discover about an author's life or times is valid and may be helpful. But a vast knowledge of the context of a poem is no guarantee that the poem itself will be

understood. To be understood it must be read—over and over. Reading any great lyric poem is a lifetime job—not, of course, in the sense that it should go on and on throughout a lifetime, but rather that as a great poem, it deserves many return visits. And during vacations from a given poem, we may learn more about it than we realise.

Books That Will Not Be Continually Analyse

If The Books are:

1. Imaginative Literature
2. Stories
3. Plays
4. Tragedy
5. Lyric Poetry
6. Poems

These Books are being analysed in Kinds of Books from 11-15, by using different type of Books to analyse these type of Genre of the books.

If The Books Non Fiction, Continually Analyse

If The book are:

1. Practical Book
2. Theoretical Book
3. Historical Book
4. Biographical Book
5. Autobiographical Book
6. Current Event

10. Economic Book
11. Philosophy Book
12. Theology Book
13. Canonical Book
14. Religious Book
15. Social Science Book
16. Any Other Non Fiction

If The Books Non Fiction, then continually analyse the books, and follow below the steps of the analysis of the book

X-raying a Book

Every book has a skeleton hidden between its covers. Your job as an analytical reader is to find it.

A book comes to you with flesh on its bare bones and clothes over its flesh. It is all dressed up. You do not have to undress it or tear the flesh off its limbs to get at the firm structure that underlies the soft surface. But you must read the book with X-ray eyes, for it is an essential part of your apprehension of any book to grasp its structure.

Recognition of the need to see the structure of a book leads to the discovery of the second and third rules for reading any book. We say “any book.” These rules apply to poetry as well as to science, and to any kind of expository work. Their application will be different, of course, according to the kind of book they are used on. The unity of a novel is not the same as the unity of a treatise on politics; nor are the parts of the same sort, or ordered in the same way. But every book without exception that is worth reading at all has a unity and an organization of parts. A book that did not would be a mess. It would be relatively unreadable, as bad books actually are.

We will state these two rules as simply as possible. Then we will explain and illustrate them.

RULE 2. STATE THE UNITY OF THE WHOLE BOOK IN A SINGLE SENTENCE, OR AT MOST A FEW SENTENCES (A SHORT PARAGRAPH). This means that you must say what the whole book is about as briefly as possible. To say what the whole book is about is not the same as saying what kind of book it is. (That was covered by Rule 1.) The word “about” may be misleading here. In one sense, a book is *about* a certain type of subject matter, which it treats in a certain way. If you know this, you know what *kind* of book it is. But there is another, more colloquial sense of “about.” We ask a person what he is about, what he is up to. So we can wonder what an author is up to, what he is trying to do. To find out what a book is about in this sense is to discover its *theme* or main *point*.

A book is a work of art. (Again, we want to warn you against too narrow a conception of “art.” We do not mean, or we do not only mean, “fine art” here. A book is the product of someone who has a certain skill in making. He is a maker of books and he has made one here for our benefit.) In proportion as it is good, as a book and as a work of art, it has a more nearly perfect, a more pervasive unity. This is true of music and paintings, of novels and plays; it is no less true of books that convey knowledge.

But it is not enough to acknowledge this fact vaguely. You must apprehend the unity with definiteness. There is only one way to know that you have succeeded. You must be able to tell yourself or anybody else what the unity is, and in a few words. (If it requires too many words, you have not seen the unity but a multiplicity.) Do not be satisfied with “feeling the unity” that you cannot express. The reader who says, “I know what it is, but I just can’t say it,” probably does not even fool himself.

RULE 3. SET FORTH THE MAJOR PARTS OF THE BOOK, AND SHOW HOW THESE ARE ORGANISED INTO A WHOLE, BY BEING ORDERED TO ONE ANOTHER AND TO THE UNITY OF THE WHOLE.

The reason for this rule should be obvious. If a work of art were absolutely simple, it would, of course, have no parts. But that is never the case. None of the sensible, physical things man knows is simple in this absolute way, nor is any human production. They are all complex unities. You have not grasped a complex unity if all you know about it is *how it is one*. You must also know *how it is many*, not a many that consists of a lot of separate things, but an organized many. If the parts were not organically related, the whole that they composed would not be one. Strictly speaking, there would be no whole at all but merely a collection.

There is a difference between a heap of bricks, on the one hand, and the single house they can constitute, on the other. There is a difference between a single house and a collection of houses. A book is like a single house. It is a mansion having many rooms, rooms on different levels, of different sizes and shapes, with different outlooks, with different uses. The rooms are independent, in part. Each has its own structure and interior decoration. But they are not absolutely independent and separate. They are connected by doors and arches, by corridors and stairways, by what architects call a “traffic pattern.” Because they are connected, the partial function that each performs contributes its share to the usefulness of the whole house. Otherwise the house would not be livable.

The analogy is almost perfect. A good book, like a good house, is an orderly arrangement of parts. Each major part has a certain amount of independence. As we will see, it may have an interior structure of its own, and it may be decorated in a different way from other parts. But it must also be connected with the other parts—that is, related to them functionally—for otherwise it would not contribute its share to the intelligibility of the whole.

As houses are more or less livable, so books are more or less readable. The most readable book is an architectural achievement on the part of the author. The best books are those that have the most intelligible structure. Though they are usually more complex than poorer books, their greater complexity is also a greater simplicity, because their parts are better organized, more unified.

That is one of the reasons why the best books are also the most readable. Lesser works are really more bothersome to read. Yet to read them well—that is, as well as they can be read—you must try to find some plan in them. They would have been better books if their authors had themselves seen the plan a little more clearly. But if they hang together at all, if they are a complex unity to any degree and not mere collections, there must be a plan and you must find it.

Of Plots and Plans: Stating the Unity of a Book

Let us return now to the second rule, which requires you to state the unity of a book. A few illustrations of the rule in operation may guide you in putting it into practice.

Let us begin with a famous case. You probably read Homer's *Odyssey* in school. If not, you must know the story of Odysseus, or Ulysses, as the Romans call him, the man who took ten years to return from the siege of Troy only to find his faithful wife Penelope herself besieged by suitors. It is an elaborate story as Homer tells it, full of exciting adventures on land and sea, replete with episodes of all sorts and many complications of plot. But it also has a single unity of action, a main thread of plot that ties everything together.

Aristotle, in his *Poetics*, insists that this is the mark of every good story, novel, or play. To support his point, he shows how the unity of the *Odyssey* can be summarized in a few sentences.

A certain man is absent from home for many years; he is jealously watched by Poseidon, and left desolate. Meanwhile his home is in a wretched plight; suitors are wasting his substance and plotting against his son. At length, tempest-tossed, he himself arrives; he makes certain persons acquainted with him; he attacks the suitors with his own hand, and is himself preserved while he destroys them.

"This," says Aristotle, "is the essence of the plot; the rest is episode."

After you know the plot in this way, and through it the unity of the whole narrative, you can put the parts into their proper places. You might find it a good exercise to try this with some novels you have read. Try it on some good ones, such as Fielding's *Tom Jones* or Dostoevsky's *Crime and Punishment* or Joyce's modern *Ulysses*. The plot of *Tom Jones*, for instance, can be reduced to the familiar formula: Boy meets girl, boy loses girl, boy gets girl. That, indeed, is the plot of every romance. To recognize this is to learn what it means to say that there are only a small number of plots in the world. The difference between good and bad stories having the same essential plot lies in what the author does with it, how he dresses up the bare bones.

You do not always have to find out the unity of a book all by yourself. The author often helps you. Sometimes, the title is all you have to read. In the eighteenth century, writers had the habit of composing elaborate titles that told the reader what the whole book was about. Here is a title by Jeremy Collier, an English divine who attacked what he considered to be the obscenity—we would say pornography, perhaps—of Restoration drama much more learnedly than is customary nowadays: *A Short View of the Immorality and Profaneness of the English Stage, together with the Sense of Antiquity upon this Argument*. You can guess from this that Collier recites many flagrant instances of the abuse of morals and that he supports his protest by quoting texts from those ancients who argued, as Plato did, that the stage corrupts youth, or, as the early Church fathers did, that plays are seductions of the flesh and the devil.

Sometimes the author tells you the unity of his plan in his preface. In this respect, expository books differ radically from fiction. A scientific or philosophical writer has no reason to keep you in suspense. In fact, the less suspense he keeps you in, the more likely you are to sustain the effort of reading his work through. Like a newspaper article, an expository book may summarize itself in its first paragraph.

Do not be too proud to accept the author's help if he proffers it, but do not rely too completely on what he says in the preface, either. The best-laid plans of authors, like those of mice and other men, often go awry. Be guided by the prospectus the author gives you, but always remember that the obligation of finding the unity belongs finally to the reader, as much as the obligation of having one belongs to the writer. You can discharge that obligation honestly only by reading the whole book.

The introductory paragraph of Herodotus' history of the war between the Greeks and the Persians provides an excellent summary of the whole. It runs:

These are the researches of Herodotus of Halicarnassus, which he publishes, in the hope of thereby preserving from decay the remembrance of what men have done, and of preventing the great and wonderful actions of the Greeks and the Barbarians from losing their due meed of glory; and withal to put on record what were their grounds of feud.

That is a good beginning for you as a reader. It tells you succinctly what the whole book is about.

But you had better not stop there. After you have read the nine parts of Herodotus' history through, you will probably find it necessary to elaborate on that statement to do justice to the whole. You might want to mention the Persian kings —Cyrus, Darius, and Xerxes; the Greek heroes of the war—primarily Themistocles; and the major events—the crossing of the Hellespont and the decisive battles, notably Thermopylae and Salamis.

All the rest of the fascinating details, with which Herodotus richly prepares you for his climax, can be left out of your summary of the plot. Note, here, that the unity of a history is a single thread of plot, very much as in fiction. So far as unity is concerned, this rule of reading elicits the same kind of answer in history and in fiction.

A few more illustrations may suffice. Let us take a practical book first. The unity of Aristotle's *Ethics* can be stated thus:

This is an inquiry into the nature of human happiness and an analysis of the conditions under which happiness may be gained or lost, with an indication of what men must do in their conduct and thinking in order to become happy or to avoid unhappiness, the principal emphasis being placed on the cultivation of the virtues, both moral and intellectual,

although other goods are also recognized as necessary for happiness, such as wealth, health, friends, and a just society in which to live.

Another practical book is Adam Smith's *The Wealth of Nations*. Here the reader is aided by the author's own statement of "the plan of the work" at the very beginning. But that takes several pages. The unity can be more briefly stated as follows:

This is an inquiry into the source of national wealth in any economy that is built on a division of labor, considering the relation of the wages paid labor, the profits returned to capital, and the rent owed the landowner, as the prime factors in the price of commodities. It discusses the various ways in which capital can be more or less gainfully employed, and relates the origin and use of money to the accumulation and employment of capital. Examining the development of opulence in different nations and under different conditions, it compares the several systems of political economy, and argues for the beneficence of free trade.

If a reader grasped the unity of *The Wealth of Nations* in this way, and did a similar job for Marx's *Das Kapital*, he would be well on the way toward seeing the relation between two of the most influential books of the past two centuries.

Darwin's *The Origin of Species* provides us with a good example of the unity of a theoretical book in science. Here is a statement of it:

This is an account of the variation of living things during the course of countless generations and the way in which this results in new groupings of plants and animals; it treats both of the variability of domesticated animals and of variability under natural conditions, showing how such factors as the struggle for existence and natural selection operate to bring about and sustain such groupings; it argues that species are not fixed and immutable groups, but that they are merely varieties in transition from a less to a more marked and permanent status, supporting this argument by evidences from extinct animals found in the earth's crust, and from comparative embryology and anatomy.

That may seem like a big mouthful, but the book was an even bigger one for a great many readers in the nineteenth century, partly because they did not go to the trouble of finding out what it was really about.

Finally, let us take Locke's *Essay Concerning Human Understanding* as a theoretical book in philosophy. You may recall our observing that Locke himself summarized his work by saying that it was "an inquiry into the origin, certainty and extent of human knowledge, together with the grounds and degrees of belief, opinion and assent." We would not quarrel with so excellent a statement of plan by the author, except to add two subordinate

qualifications to do justice to the first and third parts of the essay: it will be shown, we would add, that there are no innate ideas, but that all human knowledge is acquired from experience; and language will be discussed as a medium for the expression of thought, its proper use and most familiar abuses to be indicated.

There are two things we want you to note before we proceed. The first is how frequently you can expect the author, especially a good one, to help you to state the plan of his book. Despite that fact, most readers are at a total loss if you ask them to say briefly what the whole book is about. Partly this is owing to the widespread inability to speak concise English sentences. Partly it is owing to neglect of this rule in reading. But it also indicates that many readers pay as little attention to the author's introductory words as they ordinarily do to his title.

The second point is a word of caution. Do not take the sample summaries we have given you as if they were, in each case, a final and absolute formulation of the book's unity. A unity can be variously stated. There is no one right way to do it. One statement is better than another, of course, in proportion as it is brief, accurate, and comprehensive. But quite different statements may be equally good, or equally bad.

We have here sometimes stated the unity of a book quite differently from the author's expression of it, and without apologies to him. You may differ similarly from us. After all, a book is something different to each reader. It would not be surprising if that difference expressed itself in the way the reader stated its unity. This does not mean, however, that anything goes. Though readers are different, the book is the same, and there can be an objective check upon the accuracy and fidelity of the statements anyone makes about it.

Mastering the Multiplicity: The Art of Outlining a Book

Let us turn now to the other structural rule, the rule that requires us to set forth the major parts of the book in their order and relation. This third rule is closely related to the second. A well-stated unity indicates the major parts that compose the whole; you cannot comprehend a whole without somehow seeing its parts. But it is also true that unless you grasp the organisation of its parts, you cannot know the whole comprehensively.

Why, then, make two rules here instead of one? It is primarily a matter of convenience. It is easier to grasp a complex and unified structure in two steps than in one. The second rule directs your attention toward the unity, the third toward the complexity, of a book. There is another reason for the separation. The major parts of a book may be seen at the moment when you grasp its unity. But these parts are themselves usually complex and have an interior structure you must see. Hence the third rule involves more than just an enumeration of the parts. It means outlining them, that is, treating the parts as if they were subordinate wholes, each with a unity and complexity of its own.

A formula can be stated for operating according to this third rule. It will guide you in a general way. According to the second rule, we had to say: The whole book is about so and so and such and such. That done, we might obey the third rule by proceeding as follows: (1) The author accomplished this plan in five major parts, of which the first part is about so and so, the second part is about such and such, the third part is about this, the fourth part about that, and the fifth part about still another thing. (2) The first of these major parts is divided into three sections, of which the first considers X, the second considers Y, and the third considers Z. (3) In the first section of the first part, the author makes four points, of which the first is A, the second B, the third C, and the fourth D. And so on and so forth.

You may object to this much outlining. It would take a lifetime to read a book that way. But of course this is only a formula. The rule looks as if it required an impossible amount of work from you. In fact, the good reader does this sort of thing habitually, and hence easily and naturally. He may not write it all out. He may not even at the time of reading have made it all verbally explicit. But if he were called upon to give an account of the structure of the book, he would do something that approximated the formula we have described.

The word "approximation" should relieve your anxiety. A good rule always describes the ideal performance. But a person can be skilled in an art without being the ideal artist. He can be a good practitioner if he merely approximates the rule. We have stated the rule here for the ideal case. You should be satisfied if you make a very rough approximation to what is required.

Even when you become more skilled, you will not want to read every book with the same degree of effort. You will not find it profitable to expend all your skill on some books. Even the best readers try to make a fairly close approximation to the requirements of this rule for only a relatively few books. For the most part, they are satisfied with a rough notion of the book's structure. The degree of approximation varies with the character of the book and your purpose in reading it. Regardless of this variability, the rule remains the same. You must know how to follow it, whether you follow it closely or only in a rough fashion.

You should understand that the limitations on the degree to which you can approximate the rule are not only ones of time and effort. You are a finite, mortal creature; but a book is also finite and, if not mortal, at least defective in the way all things made by man are. No book deserves a perfect outline because no book is perfect. It goes only so far, and so must you. This rule, after all, does not call for your putting things into the book that the author did not put there. Your outline is of the book itself, not the subject matter that the book is about. Perhaps the outline of a subject matter could be extended indefinitely, but not your outline of the book, which gives the subject matter only more or less definitive treatment. Hence you should not feel that we are urging you merely to be lazy about following this rule. You could not follow it out to the bitter end even if you wanted to.

The forbidding aspect of the formula for setting forth the order and relation of the parts may be somewhat lessened by a few illustrations of the rule in operation. Unfortunately, it

is more difficult to illustrate this rule than the other one about stating the unity. A unity, after all, can be stated in a sentence or two, at most a short paragraph. But in the case of a large and complex book, a careful and adequate outline of the parts, and their parts, and *their* parts down to the least structural unit that is comprehensible and worthwhile identifying, would take a great many pages to write out.

Theoretically, the outline could be longer than the original. Some of the great medieval commentaries on the works of Aristotle *are* longer than the works they comment on. They include, of course, more than an outline, for they undertake to interpret the author sentence by sentence. The same is true of certain modern commentaries, such as the great ones on Kant's *Critique of Pure Reason*. And a variorum edition of a Shakespeare play, which includes an exhaustive outline as well as other things, is many times as long—perhaps ten times as long—as the original. You might look into a commentary of this sort if you want to see the rule followed as close to perfection as man can do. Aquinas, for instance, begins each section of his commentary with a beautiful outline of the points that Aristotle has made in a particular part of his work; and he always says explicitly how that part fits the structure of the whole, especially in relation to the parts that come before and after.

Let us take something easier than a treatise of Aristotle. Aristotle is probably the most compact of prose writers; you would expect that an outline of one of his works would be extensive and difficult. Let us also agree that, for the sake of the example, we will not carry the process out to the relative perfection that would be possible if we had a great number of pages available.

The United States Constitution is an interesting, practical document, and a very well-organized piece of writing. If you examine it, you should have no difficulty in finding its major parts. They are pretty clearly indicated, though you have to do some thinking to make the main divisions. Here is a suggested outline of the document:

FIRST: The Preamble, setting forth the purpose(s) of the Constitution;

SECOND: The first Article, dealing with the legislative department of the government;

THIRD: The second Article, dealing with the executive department of the government;

FOURTH: The third Article, dealing with the judicial department of the government;

FIFTH: The fourth Article, dealing with the relationship between the state governments and the federal government;

SIXTH: The fifth, sixth, and seventh Articles, dealing with the amendment of the Constitution, its status as the supreme law of the land, and provisions for its ratifications;

SEVENTH: The first ten amendments, constituting the Bill of Rights;

EIGHTH: The remaining amendments up to the present day.

Those are the major divisions. Now let us outline one of them, the *Second*, comprising the Constitution's first Article. Like most of the other Articles, it is divided into Sections. Here is a suggested outline.

- II, 1: Section 1, establishing legislative powers in a Congress of the United States, divided into two bodies, a Senate and a House of Representatives;**
- II, 2: Sections 2 and 3, respectively describing the composition of the House and Senate and stating the qualifications of members. In addition, it is stated that the House has the sole power of impeachment, while the Senate has the sole power of trying impeachments;**
- II, 3: Sections 4 and 5, having to do with the election of members of both branches of Congress and with the internal organization and affairs of each;**
- II, 4: Section 6, stating the perquisites and emoluments of members of both branches, and stating one limitation on civil employment of members;**
- II, 5: Section 7, defining the relationship between the legislative and executive departments of the government and describing the President's veto power;**
- II, 6: Section 8, stating the powers of Congress;**
- II, 7: Section 9, stating some limitations on the powers outlined in Section 8;**
- II, 8: Section 10, stating limitations on the powers of the states and the extent to which they must give over certain powers to the Congress.**

We could then proceed to make a similar outline of all the other major divisions, and, after completing that, return to outline the Sections in turn. Some of these, for example Section 8 in Article I, would require the identification of many different topics and subtopics.

Of course, this is only one way of doing the job. There are many others. The first three Articles could be grouped together in one major division, for instance; or instead of two divisions with respect to the amendments, more major divisions could be introduced, grouping the amendments according to the problems they dealt with. We suggest that you try your hand at making your own division of the Constitution into its main parts. Go even further than we did, and try to state the parts of the parts as well. You may have read the Constitution many times, but if you have not applied this rule before, you will find that it reveals much in the document that you never saw.

Here is one more example, again very brief. We have already stated the unity of Aristotle's *Ethics*. Now let us attempt a first approximation of its structure. The whole is divided into the following main parts: A first, treating of happiness as the end of life, and discussing it in relation to all other practicable goods; a second, treating of the nature of voluntary action, and its relation to the formation of good and bad habits; a third, discussing the various virtues and vices, both moral and intellectual; a fourth, dealing with moral states that are neither virtuous nor vicious; a fifth, treating of friendship; and a sixth and last, discussing pleasure, and completing the account of human happiness begun in the first.

These divisions obviously do not correspond to the ten books of the *Ethics*. Thus, the first part is accomplished in the first book; the second part runs through Book II and the first half of Book III; the third part extends from the rest of Book III through the end of Book VI; the discussion of pleasure occurs at the end of Book VII and again at the beginning of Book X.

We mention this to show you that you need not follow the apparent structure of a book as indicated by its chapter divisions. That structure may, of course, be better than the outline you develop, but it may also be worse; in any event, the point is to make your own outline. The author made his in order to write a good book. You must make yours in order to read it well. If he were a perfect writer and you a perfect reader, it would follow that the two would be the same. In proportion as either of you falls away from perfection, all sorts of discrepancies will inevitably result.

This does not mean that you should ignore chapter headings and sectional divisions made by the author; we did not ignore them in our analysis of the *Constitution*, although we did not slavishly follow them, either. They are intended to help you, just as titles and prefaces are. But you must use them as guides for your own activity, and not rely on them passively. There are few authors who execute their plan perfectly, but there is often more plan in a good book than meets the eye at first. The surface can be deceiving. You must look beneath it to discover the real structure.

How important is it to discover that real structure? We think very important. Another way of saying this is to say that Rule 2—the requirement that you state the unity of a book—cannot be effectively followed without obeying Rule 3—the requirement that you state the parts that make up that unity. You might, from a cursory glance at a book, be able to come up with an adequate statement of its unity in two or three sentences. But you would not really know that it was adequate. Someone else, who had read the book better, might know this, and award you high marks for your efforts. But for you, from your point of view, it would have been merely a good guess, a lucky hit. This is why the third rule is absolutely necessary as a complement to the second one.

A very simple example will show what we mean. A two-year-old child, just having begun to talk, might say that “two plus two is four.” Objectively, this is a true statement; but we would be wrong to conclude from it that the child knew much mathematics. In fact, the child probably would not know what the statement meant, and so, although the statement by itself was adequate, we would have to say that the child still needed training in the subject. Similarly, you might be right in your guess about a book’s main theme or point, but you still need to go through the exercise of showing *how* and *why* you stated it as you did. The requirement that you outline the parts of a book, and show how they exemplify and develop the main theme, is thus supportive of your statement of the book’s unity.

Inspectional Reading IV: Superficial Reading

1. Skimming through Audiobook between 190 words per minute to 375 words per minute or between 1.25-2.5 times speed
2. Normally listen audiobook from beginning to end between 190 words per minute to 285 words per minute or between 1.25-1.9 times speed
3. Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed
4. Read or Listen The Full Book Without Stopping
5. Read or listen 25min and 5min break
 - Read or Listen 20 pages an Hour according Mortimer Adler
6. Read or Listen between 1-50 times the book
7. Speed of Audiobook
 - Normally listen audiobook from beginning to end between 150 words per minute to 300 words per minute or between 1-2 times speed
8. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.
9. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem.
10. With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at different speeds—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

The Reciprocal Arts of Reading and Writing

In general, the two rules of reading that we have been discussing look as if they were rules of writing also. Of course they are. Writing and reading are reciprocal, as are teaching and being taught. If authors and teachers did not organize their communications, if they failed to unify them and order their parts, there would be no point in directing readers or listeners to search for the unity and uncover the structure of the whole.

Nevertheless, although the rules are reciprocal, they are not followed in the same way. The reader tries to *uncover* the skeleton that the book conceals. The author starts with the skeleton and tries to *cover it up*. His aim is to conceal the skeleton artistically or, in other words, to put flesh on the bare bones. If he is a good writer, he does not bury a puny skeleton under a mass of fat; on the other hand, neither should the flesh be too thin, so that the bones show through. If the flesh is thick enough, and if flabbiness is avoided, the joints will be detectable and the motion of the parts will reveal the articulation.

Why is this so? Why should not an expository book, one that attempts to present a body of knowledge in an ordered way, be merely an outline of the subject? The reason is not only that most readers cannot read outlines, and that such a book would be repellent to a self-respecting reader who thought that if he could do his job, the author ought to do his. There is more to it than that. The flesh of a book is as much a part of it as the skeleton. This is as true of books as it is of animals and human beings. The flesh—the outline spelled out, “read out,” as we sometimes say —adds an essential dimension. It adds life, in the case of the animal. Just so, actually writing the book from an outline, no matter how detailed, gives the work a kind of life that it would not otherwise have had.

We can summarize all of this by recalling the old-fashioned maxim that a piece of writing should have unity, clarity, and coherence. That is, indeed, a basic maxim of good writing. The two rules we have been discussing in this chapter relate to writing that follows that maxim. If the writing has unity, we must find it. If the writing has clarity and coherence, we must appreciate it by finding the distinction and the order of the parts. What is clear is so by the distinctness of its outlines. What is coherent hangs together in an orderly disposition of parts.

These two rules, therefore, can be used to distinguish well made books from badly made ones. If, after you have attained sufficient skill, no amount of effort on your part results in your apprehension of the unity of a book, and if you are also not able to discern its parts and their relation to one another, then very likely the book is a bad one, whatever its reputation. You should not be too quick to make this judgment; perhaps the fault is in you instead of the book. However, neither should you fail ever to make it and always assume that the fault is in you. In fact, whatever your own failings as a reader, the fault is usually in the book, for most books—the very great majority—are badly made books in the sense that their authors did not write them according to these rules.

These two rules can also, we might add, be used in reading any substantial part of an expository book, as well as the whole. If the part chosen is itself a relatively independent, complex unity, its unity and complexity must be discerned for it to be well read. Here there is a significant difference between books conveying knowledge and poetical works, plays, and novels. The parts of the former can be much more autonomous than the parts of the latter. The person who says of a novel that he has “read enough to get the idea” does not know what he is talking about. He cannot be correct, for if the novel is any good at all, the idea is in the whole and cannot be found short of reading the whole. But you can get the idea of Aristotle’s *Ethics* or Darwin’s *Origin of Species* by reading some parts carefully, although you would not, in that case, be able to observe Rule 3.

Discovering the Author’s Intentions

There is one more rule of reading that we want to discuss in this chapter. It can be stated briefly. It needs little explanation and no illustration. It really repeats in another form what you have already done if you have applied the second and third rules. But it is a useful repetition because it throws the whole and its parts into another light.

RULE 4. FIND OUT WHAT THE AUTHOR’S PROBLEMS WERE. The author of a book starts with a question or a set of questions. The book ostensibly contains the answer or answers.

The writer may or may not tell you what the questions were as well as give you the answers that are the fruits of his work. Whether he does or does not, and especially if he does not, it is your task as a reader to formulate the questions as precisely as you can. You should be able to state the main question that the book tries to answer, and you should be able to state the subordinate questions if the main question is complex and has many parts. You should not only have a fairly adequate grasp of all the questions involved but should also be able to put the questions in an intelligible order. Which are primary and which secondary? Which questions must be answered first, if others are to be answered later?

You can see how this rule duplicates, in a sense, work you have already done in stating the unity and finding its parts. It may, however, actually help you to do that work. In other words, following the fourth rule is a useful procedure in conjunction with obeying the other two.

And since the rule is a little more unfamiliar than the other two, it may be even more helpful to you in tackling a difficult book. We want to emphasize, however, that we do not mean for you to fall into what is called by critics the intentional fallacy. That is the fallacy of thinking you can discover what was in an author’s mind from the book he has written. This applies particularly to literary works; it is a grave error, for example, to try to psychoanalyze Shakespeare from the evidence of *Hamlet*. Nevertheless, even with a poetical work, it is often extremely helpful to try to say what the author was trying to do. In the case of expository works, the rule has obvious merit. And yet most readers, no matter how skilled

in other respects, very often fail to observe it. As a result, their conception of a book's main point or theme may be extremely deficient, and of course their outline of its structure will be chaotic. They will fail to see the unity of a book because they do not see *why it has the unity it has*; and their apprehension of the book's skeletal structure will lack comprehension of *the end that it serves*.

If you know the kinds of questions anyone can ask about anything, you will become adept in detecting an author's problems. They can be formulated briefly: Does something exist? What kind of thing is it? What caused it to exist, or under what conditions can it exist, or why does it exist? What purpose does it serve? What are the consequences of its existence? What are its characteristic properties, its typical traits? What are its relations to other things of a similar sort, or of a different sort? How does it behave? *These are all theoretical questions*. What ends should be sought? What means should be chosen to a given end? What things must one do to gain a certain objective, and in what order? Under these conditions, what is the right thing to do, or the better rather than the worse? Under what conditions would it be better to do this rather than that? *These are all practical questions*.

This list of questions is far from being exhaustive, but it does represent the types of most frequently asked questions in the pursuit of theoretical or practical knowledge. It may help you discover the problems a book has tried to solve. The questions have to be adapted when applied to works of imaginative literature, and there too they will be useful.

The First Stage of Analytical Reading

We have now stated and explained the first four rules of reading. They are rules of analytical reading, although if you inspect a book well before reading it, that will help you to apply them.

It is important at this point to recognise that these first four rules are connected and form a group of rules having a single aim. Together, they provide the reader who applies them with a knowledge of a book's structure. When you have applied them to a book, or indeed to anything fairly lengthy and difficult that you may be reading, you will have accomplished the first stage of reading it analytically.

You should not take the term "stage" in a chronological sense, unless perhaps at the very beginning of your exercise as an analytical reader. That is, it is not necessary to read a book through in order to apply the first four rules, then to read it again and again in order to apply the other rules. The practiced reader accomplishes all of these stages at once. Nevertheless, you must realize that knowing a book's structure does constitute a stage toward reading it analytically.

Another way to say this is that applying these first four rules helps you to answer the first basic question about a book. You will recall that that first question is: *What is the book about as a whole?* You will also recall that we said that this means discovering the leading theme of the book, and how the author develops this theme in an orderly way by subdividing it into its essential subordinate themes or topics. Clearly, applying the first four rules of reading will provide most of what you need to know in order to answer this question—although it should be pointed out that your answer will improve in accuracy as you proceed to apply the other rules and to answer the other questions.

Since we have now described the first stage of analytical reading, let us pause a moment to write out the first four rules in order, under the appropriate heading, for review.

Theoretical book Questions

- What?
- Who?
- When?
- Where?
- How?
- Do/Does?
- Can?
- May/might?
- Does something exist?
- What kind of thing is it?
- What caused it to exist, or?
- Under what conditions can it exist, or why does it exist?
- What purpose does it serve?
- What are the consequences of its existence?
- What are its characteristic properties, its typical traits?
- What are its relations to other things of a similar sort, or of a different sort?
- How does it behave?
- These are all theoretical questions. What ends should be sought?

2. Practical book Questions.

- What?
- Who?
- When?
- Where?
- How?
- Do/Does?
- Can?
- May/might?
- What means should be chosen to a given end?
- What things must one do to gain a certain objective, and in what order? Under these conditions, what is the right thing to do, or the better rather than the worse?
- Under what conditions would it be better to do this rather than that? These are practical questions.

3. History Questions

- Who
- What
- Where
- When
- Why
- How

Despite the fact that most histories are closer to fiction than to science, they can be read as expository works, and therefore they should be. Hence, we must ask the same questions of a historical book that we ask of any expository book. Because of the special nature of history, we must ask those questions a little differently and must expect to receive slightly different kinds of answers. As far as the first question is concerned, every history has a particular and limited subject. It is surprising, then, how often readers do not trouble to find out what this is. In particular, they do not always note carefully what limitations the author sets for himself. A history of the Civil War is not a history of the world in the nineteenth century. It probably will not be a history of the American West in the 1860s. It could, though perhaps it should not, ignore the state of American education in that decade, or the movement of the American frontier, or the progress of American freedom. Hence, if we are to read a history well, it is necessary to know precisely what it is about and what it is not about. Certainly, if we are to criticize it, we must know the latter. An author cannot be blamed for not doing what he did not try to do.

With regard to the second question, the historian tells a story, and that story, of course, occurred in time. Its general outlines are thus determined, and we do not have to search for them. But there is more than one way to tell a story, and we must know how the historian has chosen to tell his. Does he divide his work into chapters that correspond to years or decades or generations? Or does he divide it according to other rubrics of his own choosing? Does he discuss, in one chapter, the economic history of his period, and cover its wars and religious movements and literary productions in others? Which of these is most important to him? If we discover that, if we can say which aspect of the story he is telling seems to him most fundamental, we can understand him better. We may not agree with his judgment about what is basic, but we can still learn from him.

Criticism of history takes two forms. We can judge—but only, as always, after we understand what is being said—that a historian's work lacks verisimilitude. People just do not act that way, we may feel. Even if the historian documents his statements by giving us access to his sources, and even if to our knowledge they are relevant, we can still feel that

he has misunderstood them, that he has judged them in the wrong way, perhaps through some deficiency in his grasp of human nature or human affairs. We tend to feel this, for example, about many older historians who do not include much discussion of economic matters in their work. People, we may be inclined to think now, act out of self-interest; too much nobility ascribed to the “hero” of a history may make us suspicious. On the other hand, we may think, especially if we have some special knowledge of the subject, that the historian has misused his sources. We may be indignant to discover that he has not read a certain book that we have read. And he may be misinformed about the facts of the matter. In that case, he cannot have written a good history of it. We expect a historian to be informed.

The first criticism is, however, more important. A good historian must combine the talents of the storyteller and the scientist. He must know what is likely to have happened as well as what some witnesses or writers said actually did happen. With regard to the last question, What of it?, it is possible that no kind of literature has a greater effect on the actions of men than history. Satires and pictures of philosophical utopias have little effect; we would all like the world to be better, but we are seldom inspired by the recommendations of authors who do no more than describe, often bitterly, the difference between the real and the ideal. History, which tells us of the actions of men of the past, often does lead us to make changes, to try to better our lot. In general, statesmen have been more learned in history than in other disciplines. History suggests the possible, for it describes things that have already been done. If they have been done, perhaps they can be done again—or perhaps they can be avoided. The main answer to the question, What of it?, therefore, lies in the direction of practical, political action. For this reason it is of great importance that history be read well. Unfortunately, leaders have often acted with some knowledge of history but not enough. With the world as small and dangerous as it has become, it would be a good idea for all of us to start reading history better.

4. Biography Question.

- How?
- Do/Does?
- Can?
- May/might?

6. Current Events Question

Thus the most important thing to know, when reading any report of current happenings, is *who is writing the report*. What is involved here is not so much an acquaintance with the reporter himself as with the *kind* of mind he has. The various sorts of filter-reporters fall into groups. To understand what kind of filter our reporter's mind is, we must ask a series of questions about it. This amounts to asking a series of questions about any material dealing with current events. The questions are these:

1. What does the author want to prove?
2. Whom does he want to convince?
3. What special knowledge does he assume?
4. What special language does he use?
5. Does he really know what he is talking about?

For the most part it is safe to assume that all current events books want to prove something. Often it is easy enough to discover what this is. The blurb often states the main contention or thesis of such books. If it does not appear there, it may be stated by the author in a preface.

Having asked what the book is trying to prove, you should next ask whom the author is trying to convince. Is the book intended for those "in the know"—and are you in that category? Is it for that small group of persons who can do something, and quickly, about the situation the author describes? Or is it for everyone? If you do not belong to the audience for which the book is intended, you may not want to read it.

8. Philosophy

- What?
- Who?
- When?
- Where?
- How?
- Do/Does?
- Can?
- May/might?

What are these “childishly simple” questions that philosophers ask? When we write them down, they do not seem simple, because to answer them is so difficult. Nevertheless, they are initially simple in the sense of being basic or fundamental.

Take the following questions about *being or existence*, for example: What is the difference between existing and not existing? What is common to all the things that do exist, and what are the properties of everything that does exist? Are there different ways in which things can exist—different modes of being or existence? Do some things exist only in the mind or for the mind, whereas others exist outside the mind, and whether or not they are known to us, or even knowable by us? Does everything that exists exist physically, or are there some things that exist apart from material embodiment? Do all things change, or is there anything that is immutable? Does anything exist necessarily, or must we say that everything that does exist might not have existed? Is the realm of possible existence larger than the realm of what actually does exist?

These are typically the kind of questions that a philosopher asks when he is concerned to explore the nature of being itself and the realms of being. As questions, they are not difficult to state or understand, but they are enormously difficult to answer—so difficult, in fact, that there are philosophers, especially in recent times, who have held that they cannot be answered in any satisfactory manner.

Another set of philosophical questions concerns *change or becoming* rather than being. Of the things in our experience to which we would unhesitatingly attribute existence, we would also say that all of them are subject to change. They come into being and pass away; while in being, most of them move from one place to another; and many of them change in quantity or in quality: they become larger or smaller, heavier or lighter; or, like the ripening apple and the aging beefsteak, they change in color.

What is involved in any change? In every process of change, is there something that endures unchanged as well as some respect or aspect of that enduring thing which undergoes change? When you learn something that you did not know before, you have certainly changed with respect to the knowledge you have acquired, but you are also the same individual that you were before; if that were not the case, *you* could not be said to have changed through learning. Is this true of all change? For example, is it true of such

remarkable changes as birth and death—of coming to be and passing away—or only of less fundamental changes, such as local motion, growth, or alteration in quality? How many different kinds of change are there? Do the same fundamental elements or conditions enter into all processes of change, and are the same causes operative in all? What do we mean by a cause of change? Are there different types of causes responsible for change? Are the causes of change—of becoming—the same as the causes of being, or existence?

Such questions are asked by the philosopher who turns his attention from being to becoming and also tries to relate becoming to being. Once again, they are not difficult questions to state or understand, though they are extremely difficult to answer clearly and well. In any case, you can see how they begin with a childishly simple attitude toward the world and our experience of it.

Unfortunately, we do not have space to go into the whole range of questions more deeply. We can only list some other questions that philosophers ask and try to answer. There are questions not only about being and becoming, but also about necessity and contingency; about the material and the immaterial; about the physical and the non-physical; about freedom and indeterminacy; about the powers of the human mind; about the nature and extent of human knowledge; about the freedom of the will.

All these questions are speculative or theoretical in the sense of those terms that we have employed in distinguishing between the theoretical and practical realms. But philosophy, as you know, is not restricted to theoretical questions only.

Take *good and evil*, for instance. Children are much concerned with the difference between good and bad; their behinds are likely to suffer if they make mistakes about it. But we do not stop wondering about the difference when we grow up. Is there a universally valid distinction between good and evil? Are there certain things that are always good, others that are always bad, whatever the circumstances? Or was Hamlet right when, echoing Montaigne, he said: "There is nothing either good or bad but thinking makes it so."

Good and evil, of course, are not the same as right and wrong; the two pairs of terms seem to refer to different classes of things. In particular, even if we feel that whatever is right is good, we probably do not feel that whatever is wrong is evil. But how do we make this distinction precise?

"Good" is an important philosophical word, but it is an important word in our everyday vocabulary, too. Trying to say what it means is a heady exercise; it will involve you very deeply in philosophy before you know it. There are many things that are good, or, as we would prefer to say, there are many goods. Is it possible to order the goods? Are some more important than others? Do some depend on others? Are there circumstances in which goods conflict, so that you have to choose one good at the expense of forgoing another?

Again, we do not have space to go more extensively into these questions. We can only list some other questions in the practical realm. There are questions not only about

good and evil, right and wrong, and the order of goods, but also about duties and obligations; about virtues and vices; about happiness, life's purpose or goal; about justice and rights in the sphere of human relations and social interaction; about the state and its relation to the individual; about the good society, the just polity, and the just economy; about war and peace.

The two groups of questions that we have discussed determine or identify two main divisions of philosophy. The questions in the first group, the questions about being and becoming, have to do with what *is* or *happens* in the world. Such questions belong to the division of philosophy that is called theoretical or speculative. The questions in the second group, the questions concerning good and evil, or right and wrong, have to do with what *ought* to be done or sought, and they belong to the division of philosophy that is sometimes called practical, and is more accurately called normative. Books that tell you how to make something, such as a cookbook, or how to do something, such as a driver's manual, need not try to argue that you ought to become a good cook, or learn to drive a car well; they can assume that you want to make or do something and merely tell you how to succeed in your efforts. In contrast, books of normative philosophy concern themselves primarily with the goals all men *ought* to seek—goals such as leading a good life or instituting a good society—and, unlike cookbooks and driving manuals, they go no further than prescribing in the most universal terms the means that *ought* to be employed in order to achieve these goals.

The questions that philosophers ask also serve to distinguish subordinate branches of the two main divisions of philosophy. A work of speculative or theoretical philosophy is metaphysical if it is mainly concerned with questions about being or existence. It is a work in the philosophy of nature if it is concerned with becoming—with the nature and kinds of changes, their conditions and causes. If its primary concern is with knowledge—with questions about what is involved in our knowing anything, with the causes, extent, and limits of human knowledge, and with its certainties and uncertainties—then it is a work in epistemology, which is just another name for theory of knowledge. Turning from theoretical to normative philosophy, the main distinction is between questions about the good life and what is right or wrong in the conduct of the individual, all of which fall within the sphere of ethics, and questions about the good society and the conduct of the individual in relation to the community—the sphere of politics or political philosophy.

THE FIRST STAGE OF ANALYTICAL READING, OR RULES FOR FINDING WHAT A BOOK IS ABOUT

- 1. Classify the book according to kind and subject matter.**
- 2. State what the whole book is about with the utmost brevity.**
- 3. Enumerate its major parts in their order and relation, and outline these parts as you have outlined the whole.**
- 4. Define the problem or problems the author is trying to solve.**

Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context?

Analysis of Grammar.

English Grammar: What topics to cover when analyse the grammar

Rule 5. Review and analyze text in grammatical way. There are number of things I will look when analyse and review text in grammatical way:

- A. The verb.
- B. Verb and Auxiliaries.
- C. The semantics of the verb phrase.
- D. Nouns and determiners.
- E. Noun and noun phrases.
- F. Pronouns and numerals.
- G. Adjectives and adverbs.
- H. The semantics and grammar of adverbials.
- I. Prepositions and prepositional phrases.
- J. The clause: adjunct.
- K. Negation.
- L. Clause type and Illocutionary Force.
- M. Content clauses and reported speech.
- N. Relative construction and unbounded dependencies.
- O. Comparative construction.
- P. Non finite and verbless clauses.
- Q. Coordination and supplementation.
- R. Information packaging.
- S. Deixis and anaphora.
- T. Inflectional morphology and related matters.
- U. Lexical words.
- V. Punctuation.
- W. The simple sentence.
- X. Sentence type and discourse and functions.
- Y. Pro forms and ellipsis.
- Z. Coordination.

- AA. The complex sentences.
- BB. Syntactic and semantic functions and subordinate clauses.
- CC. Complementization of verbs and adjectives.
- DD. The noun phrase.
- EE. Theme, focus and information processing.
- FF. From sentence to text.

Grammar

 - Critical Discourse Analysis_ The Critical Study of Language.
 - Discourse analysis.
 - The Routledge handbook of discourse analysis.

Inspectional Reading V: Superficial Reading

1. Skimming through Audiobook between 190 words per minute to 375 words per minute or between 1.25-2.5 times speed.
2. Normally listen audiobook from beginning to end between 190 words per minute to 285 words per minute or between 1.25-1.9 times speed.
3. Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed.
4. Read or Listen The Full Book Without Stopping.
5. Read or listen 25min and 5min break.
 - Read or Listen 20 pages an Hour according Mortimer Adler.
6. Read or Listen between 1-50 times the book.
7. Speed of Audiobook.
 - Normally listen audiobook from beginning to end between 150 words per minute to 300 words per minute or between 1-2 times speed.
8. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.
9. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem.
10. With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at different speeds—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

Topics in Interpretation

Rule 6. Review The Figure of Speech of the Book the Author Wrote. Check Figure of Speech Folder.

- A. Literary Device.**
- B. FIGURES OF SPEECH - Biblical Research Journal.**
- C. Figure of Speech.**

Rule 7. Review and analyze text in hermeneutical way. There are number of things I will look when analyse and review text in Hermeneutical way By Milton Terry

- A. Symbols-What does it mean of symbols?**
- B. What Symbols meant at that time?**
- C. Did the symbols changed the meaning over time?**
- D. Books on Symbols.**
 - Blake Dictionary_ The Ideas and Symbols of William Blake.**
 - A Dictionary of Literary Symbols.**
 - A Dictionary of Literary Symbols.**

Analysis of Logic: Coming to Terms with an Author

RULE 8. COMING TO TERMS WITH AN AUTHOR

A term is not a word—at least, not just a word without further qualifications. If a term and a word were exactly the same, you would only have to find the important words in a book in order to come to terms with it. But a word can have many meanings, especially an important word. If the author uses a word in one meaning, and the reader reads it in another, words have passed between them, but they have not come to terms. Where there is unresolved ambiguity in communication, there is no communication, or at best communication must be incomplete.

- A. Define each Term.
- B. Terms vs Opposite terms.
- C. Academic Terms.
- D. Make a list of the words that have not been understood and define them and find out the context.
- E. Ask the author, speaker, presenter or debater define the term.

Rules 9 Review and analyze text in logical way. There are number of things I will look when analyse and review text in Logical way:

- A. Basic Concepts.
- B. Language and definition.
- C. Informal Fallacies.
- D. Categorical Propositions.
- E. Categorical Syllogism.
- F. Propositional Logic.
- G. Natural Deduction in Propositional Logic.
- H. Predicate Logic.
- I. Analogy and Legal and Moral Reasoning.
- J. Causality and Mill's Reasoning.
- K. Probability.
- L. Statistical Reasoning.
- M. Hypothetical Scientific Reasoning.
- N. Science and Superstition.

- 13. Logic Complete Introduction.**
- 14. Socratic Logic A Logic Text using Socratic Method, Platonic Questions, and Aristotelian Principles.**
- 15. Complete Works By Aristotle.**

The first stage of analytical reading has been accomplished when you have applied the four rules listed at the end of the last chapter, which together allow you to tell what a book is about and to outline its structure. You are now ready to go on to the next stage, which also comprises four rules of reading. The first of these we call, for short, coming to terms.

Coming to terms is usually the last step in any successful business negotiation. All that remains is to sign on the dotted line. But in the analytical reading of a book, coming to terms is the first step beyond the outline. Unless the reader comes to terms with the author, the communication of knowledge from one to the other does not take place. For a *term is the basic element of communicable knowledge.*

Words vs. Terms

A *term* is not a *word*—at least, not just a word without further qualifications. If a term and a word were exactly the same, you would only have to find the important words in a book in order to come to terms with it. But a word can have many meanings, especially an important word. If the author uses a word in one meaning, and the reader reads it in another, words have passed between them, but they have not come to terms. Where there is unresolved ambiguity in communication, there is no communication, or at best communication must be incomplete.

Just look at the word “communication” for a moment. Its root is related to the word “common.” We speak of a community as a group of people who have something in common. Communication is an effort on the part of one person to share something with another person (or with an animal or a machine): his knowledge, his decisions, his sentiments. It succeeds only when it results in a common something, such as an item of information or knowledge that two parties share.

When there is ambiguity in the communication of knowledge, all that is in common are the words that one person speaks or writes and another hears or reads. So long as ambiguity persists, there is no meaning in common between writer and reader. For the communication to be successfully completed, therefore, it is necessary for the two parties to use the same words *with the same meanings*—in short, to come to terms. When that happens, communication happens, the miracle of two minds with but a single thought.

A term can be defined as an unambiguous word. That is not quite accurate, for strictly there are no unambiguous words. What we should have said is that a term is a word *used unambiguously*. The dictionary is full of words. They are almost all ambiguous in the sense that they have many meanings. But a word that has several meanings can be used in one sense at a time. When writer and reader somehow manage for a time to use a given word with one and only one meaning, then, during that time of unambiguous usage, they have come to terms.

You cannot find terms in dictionaries, though the materials for making them are there. Terms occur only in the process of communication. They occur when a writer tries to avoid ambiguity and a reader helps him by trying to follow his use of words. There are, of course, many degrees of success in this. Coming to terms is the ideal toward which writer and reader should strive. Since this is one of the primary achievements of the art of writing and reading, we can think of terms as *a skilled use of words for the sake of communicating knowledge*.

At this point it is probably clear that we are speaking exclusively of expository writers and expository books. Poetry and fiction are not nearly so concerned with the unambiguous use of words as expository works—works that convey knowledge in the broad sense of the word that we have been employing. It can even be argued that the best poetry is that which is the most richly ambiguous, and it has been said with justice that any good poet is sometimes intentionally ambiguous in his writing. This is an important insight

about poetry to which we will return later. It is obviously one of the primary differences between the poetical and the expository or scientific realms of literary art.

We are now ready to state the fifth rule of reading (an expository work). Stated roughly, it is this: You must spot the important words in a book and figure out how the author is using them. But we can make that a little more precise and elegant: RULE 10. FIND THE IMPORTANT WORDS AND THROUGH THEM COME TO TERMS WITH THE AUTHOR. Note that the rule has two parts. The first part is to locate the important words, the words that make a difference. The second part is to determine the meaning of these words, as used, with precision.

This is the first rule for the second stage of analytical reading, the aim of which is not the outlining of a book's structure but the interpretation of its contents or message. The other rules for this stage, to be discussed in the next chapter, are like this one in an important respect. They also require you to take two steps: a step dealing with the language as such, and a step beyond the language to the thought that lies behind it.

If language were a pure and perfect medium for thought, these steps would not be separate. If every word had only one meaning, if words could not be used ambiguously, if, in short, each word was an ideal term, language would be a diaphanous medium. The reader would see straight through the writer's words to the content of his mind. If that were the case, there would be no need at all for this second stage of analytical reading. Interpretation would be unnecessary.

But of course that is far from the case. There is no use crying about it, no use making up impossible schemes for an ideal language, as the philosopher Leibniz and some of his followers have tried to do. Indeed, if they succeeded, there would be no more poetry. The only thing to do, therefore, in expository works, is to make the best of language as it is, and the only way to do that is to use language as skillfully as possible when you want to convey, or to receive, knowledge.

Because language is imperfect as a medium for conveying knowledge, it also functions as an obstacle to communication. The rules of interpretive reading are directed to overcoming that obstacle. We can expect a good writer to do his best to reach us through the barrier language inevitably sets up, but we cannot expect him to do the job all by himself. We must meet him halfway. We, as readers, must try to tunnel through from our side of the barrier. The likelihood of a meeting of minds *through* language depends on the willingness of both reader and writer to work together. Just as teaching will not avail unless there is a *reciprocal activity of being taught*, so no author, regardless of his skill in writing, can achieve communication without a *reciprocal skill on the part of readers*. If that were not so, the diverse skills of writing and reading would not bring minds together, however much effort was expended, any more than the men who tunnel through from opposite sides of a mountain would ever meet unless they made their calculations according to the same principles of engineering.

As we have pointed out, each of the rules of interpretive reading involves two steps. To get technical for a moment, we may say that these rules have a grammatical and a logical aspect. The grammatical aspect is the one that deals with words. The logical step deals with their meanings or, more precisely, with terms. So far as communication is concerned, both steps are indispensable. If language is used without thought, nothing is being communicated. And thought or knowledge cannot be communicated without language. As arts, grammar and logic are concerned with language in relation to thought and thought in relation to language. That is why skill in both reading and writing is gained through these arts.

This business of language and thought—especially the distinction between words and terms—is so important that we are going to risk being repetitious to be sure the main point is understood. The main point is that *one* word can be the vehicle for *many* terms, and *one* term can be expressed by *many* words. Let us illustrate this schematically in the following manner. The word “reading” has been used in many senses in the course of our discussion. Let us take three of these senses: By the word “reading” we may mean (1) reading to be entertained, (2) reading to get information, and (3) reading to achieve understanding.

Now let us symbolise the word “reading” by the letter *X*, and the three meanings by the letters *a*, *b*, and *c*. What is symbolised in this scheme by *Xa*, *Xb*, and *Xc*, are not three words, for *X* remains the same throughout. But they are three terms, on the condition, of course, that you, as reader, and we, as writers know when *X* is being used in one sense and not another. If we write *Xa* in a given place, and you read *Xb*, we are writing and you are reading the same word, but not in the same way. The ambiguity prevents or at least impedes communication. Only when you think the word as we think it, do we have one thought between us. Our minds cannot meet in *X*, but only in *Xa* or *Xb* or *Xc*. Thus we come to terms.

You cannot locate the key words without making an effort to understand the passage in which they occur. This situation is somewhat paradoxical. If you do understand the passage, you will, of course, know which words in it are the most important. If you do not fully understand the passage, it is probably because you do not know the way the author is using certain words. If you mark the words that trouble you, you may hit the very ones the author is using specially. That this is likely to be so follows from the fact that you should have no trouble with the words the author uses in an ordinary way.

From your point of view as a reader, therefore, the most important words are those that give you trouble. It is likely that these words are important for the author as well. However, they may not be.

It is also possible that words that are important for the author do not bother you, and precisely because you understand them. In that case, you have already come to terms with the author. Only where you fail to come to terms have you work still to do.

- A. Define each Term.
- B. Does the definition is coextensive with the things defined. Is is too broad or too narrow or neither?
- C. Is the definition clear or obscure?
- D. Is the definition literal or metaphorical?
- E. Is the definition brief or long?
- F. Is the definition negative, positive?
- G. Is the definition circular?
- H. Is the definition nominal definition?
- I. Is the definition is essential definition?
- J. What type of definition?
 - Stipulative Definition.
 - Lexical Definition.

Finding the Key Words

We are now prepared to put flesh on the rule that requires the reader to come to terms. How does he go about doing it? How does he find the important or key words in a book?

You can be sure of one thing. Not all the words an author uses are important. Better than that, you can be sure that most of his words are not. Only those words that he uses in a special way are important for him, and for us as readers. This is not an absolute matter, of course, but one of degree. Words may be more or less important. Our only concern is with the fact that some words in a book are more important than others. At one extreme are the words that the author uses as the proverbial man in the street does. Since the author is using these words as everyone does in ordinary discourse, the reader should have no trouble with them. He is familiar with their ambiguity and he has grown accustomed to the variation in their meanings as they occur in this context or that.

For example, the word “reading” occurs in A. S. Eddington’s book, *The Nature of the Physical World*. He speaks of “pointer-readings,” the readings of dials and gauges on scientific instruments. He is using the word “reading” in one of its ordinary senses. It is not for him a technical word. He can rely on ordinary usage to convey what he means to the

reader. Even if he used the word “reading” in a different sense somewhere else in the book—in a phrase, let us say, such as “reading nature”—he could be confident that the reader would note the shift to another of the word’s ordinary meanings. The reader who could not do this could not talk to his friends or carry on his daily business.

But Eddington is not able to use the word “cause” so lightheartedly. That may be a word of common speech, but he is using it in a definitely special sense when he discusses the theory of causation. How that word is to be understood makes a difference that both he and the reader must bother about. For the same reason, the word “reading” is important in this book. We cannot get along with merely using it in an ordinary way.

An author uses most words as men ordinarily do in conversation, with a range of meanings, and trusting to the context to indicate the shifts. Knowing this fact is some help in detecting the more important words. We must not forget, however, that at different times and places the same words are not equally familiar items in daily usage. Contemporary writers will employ most words as they are ordinarily used *today*, and you will know which words these are because you are alive today. But in reading books written in the past, it may be more difficult to detect the words the author is using as most people did at the time and place he was writing. The fact that some authors intentionally employ archaic words, or archaic senses of words, complicates the matter further, as does the translation of books from foreign languages.

Nevertheless, it remains true that most of the words in any book can be read just as one would use them in talking to one’s friends. Take any page of this book and count the words we are using in that way: all the prepositions, conjunctions, and articles, and almost all of the verbs, nouns, adverbs, and adjectives. In this chapter so far, there have been only a few important words: “word,” “term,” “ambiguity,” “communication,” and perhaps one or two more. Of these, “term” is clearly the most important; all the others are important in relation to it.

You cannot locate the key words without making an effort to understand the passage in which they occur. This situation is somewhat paradoxical. If you do understand the passage, you will, of course, know which words in it are the most important. If you do not fully understand the passage, it is probably because you do not know the way the author is using certain words. If you mark the words that trouble you, you may hit the very ones the author is using specially. That this is likely to be so follows from the fact that you should have no trouble with the words the author uses in an ordinary way.

From your point of view as a reader, therefore, the most important words are *those that give you trouble*. It is likely that these words are important for the author as well. However, they may not be.

It is also possible that words that are important for the author do not bother you, and precisely because you understand them. In that case, you have already come to terms with the author. Only where you fail to come to terms have you work still to do.

Technical Words and Special Vocabularies

So far we have been proceeding negatively by eliminating the ordinary words. You discover some of the important words by the fact that they are *not ordinary for you*. That is why they bother you. But is there any other way of spotting the important words? Are there any positive signs that point to them?

There are several. The first and most obvious sign is the explicit stress an author places upon certain words and not others. He may do this in many ways. He may use such typographical devices as quotation marks or italics to mark the word for you. He may call your attention to the word by explicitly discussing its various senses and indicating the way he is going to use it here and there. Or he may emphasize the word by defining the thing that the word is used to name.

No one can read Euclid without knowing that such words as “point,” “line,” “plane,” “angle,” “parallel,” and so forth are of the first importance. These are the words that name geometrical entities defined by Euclid. There are other important words, such as “equals,” “whole,” and “part,” but these do not name anything that is defined. You know they are important from the fact that they occur in the axioms. Euclid helps you here by making his primary propositions explicit at the very beginning. You can guess that the terms composing such propositions are basic, and that underlines for you the words that express these terms. You may have no difficulty with these words, because they are words of common speech, and Euclid appears to be using them that way.

If all authors wrote as Euclid did, you may say, this business of reading would be much easier. But that of course is not possible, although there have in fact been men who thought that any subject matter could be expounded in the geometrical manner. The procedure—the method of exposition and proof—that works in mathematics is not applicable in every field of knowledge. In any event, for our purposes it is sufficient to note what is common to every sort of exposition. *Every field of knowledge has its own technical vocabulary*. Euclid makes his plain right at the beginning. The same is true of any writer, such as Galileo or Newton, who writes in the geometrical manner. In books differently written or in other fields, the technical vocabulary must be discovered by the reader.

If the author has not pointed out the words himself, the reader may locate them through having some prior knowledge of the subject matter. If he knows something about biology or economics before he begins to read Darwin or Adam Smith, he certainly has some leads toward discerning the technical words. The rules of analyzing a book's structure may help here. If you know what kind of book it is, what it is about as a whole, and what its major parts are, you are greatly aided in separating the technical vocabulary from the ordinary words. The author's title, chapter headings, and preface may be useful in this connection.

From this you know, for example, that “wealth” is a technical word for Adam Smith, and “species” for Darwin. Since one technical word leads to another, you cannot help but discover other technical words in a similar fashion. You can soon make a list of the important words used by Adam Smith: labor, capital, land, wages, profits, rent, commodity,

price, exchange, productive, unproductive, money, and so forth. And here are some you cannot miss in Darwin: variety, genus, selection, survival, adaptation, hybrid, fittest, creation.

Where a field of knowledge has a well-established technical vocabulary, the task of locating the important words in a book treating that subject matter is relatively easy. You can spot them *positively* through having some acquaintance with the field, or *negatively* by knowing what words must be technical, because they are not ordinary. Unfortunately, there are many fields in which a technical vocabulary is not well established.

Philosophers are notorious for having private vocabularies. There are some words, of course, that have a traditional standing in philosophy. Though they may not be used by all writers in the same sense, they are nevertheless technical words in the discussion of certain problems. But philosophers often find it necessary to coin new words, or to take some word from common speech and *make it a technical word*. This last procedure is likely to be most misleading to the reader who supposes that he knows what the word means, and therefore treats it as an ordinary word. Most good authors, however, anticipating just this confusion, give very explicit warning whenever they adopt the procedure.

In this connection, one clue to an important word is that the author quarrels with other writers about it. When you find an author telling you how a particular word has been used by others, and why he chooses to use it otherwise, you can be sure that word makes a great difference to him.

We have here emphasized the notion of technical vocabulary, but you must not take this too narrowly. The relatively small set of words that express an author's main ideas, his leading concepts, constitutes his special vocabulary. They are the words that carry his analysis, his argument. If he is making an original communication, some of these words are likely to be used by him in a very special way, although he may use others in a fashion that has become traditional in the field. In either case, these are the words that are most important *for him*. They should be important *for you* as a reader also, but in addition any other word whose meaning is not clear is important for you.

The trouble with most readers is that they simply do not pay enough attention to words to locate their difficulties. They fail to distinguish the words that they do not understand sufficiently from those they do. All the things we have suggested to help you find the important words in a book will be of no avail unless you make a deliberate effort to note the words you must work on to find the terms they convey. The reader who fails to ponder, or at least to mark, the words he does not understand is headed for disaster.

If you are reading a book that can increase your understanding, it stands to reason that not all of its words will be completely intelligible to you. If you proceed as if they were all ordinary words, all on the same level of general intelligibility as the words of a newspaper article, you will make no headway toward interpretation of the book. You might

just as well be reading a newspaper, for the book cannot enlighten you if you do not try to understand it.

Most of us are addicted to non-active reading. The outstanding fault of the non-active or undemanding reader is his inattention to words, and his consequent failure to come to terms with the author.

Finding the Meanings

RULE 12. You have to discover the meaning of a word you do not understand by using the meanings of all the other words in the context that you do understand.

Spotting the important words is only the beginning of the task. It merely locates the places in the text where you have to go to work. There is another part of this fifth rule of reading. Let us turn to that now. Let us suppose you have marked the words that trouble you. What next?

There are two main possibilities. Either the author is using these words in a single sense throughout or he is using them in two or more senses, shifting his meaning from place to place. In the first alternative, the word stands for a single term. A good example of the use of important words so that they are restricted to a single meaning is found in Euclid. In the second alternative, the word stands for several terms.

In the light of these alternatives, your procedure should be as follows. First, try to determine whether the word has one or many meanings. If it has many, try to see how they are related. Finally, note the places where the word is used in one sense or another, and see if the context gives you any clue to the reason for the shift in meaning. This last will enable you to follow the word in its change of meanings with the same flexibility that characterises the author's usage.

But, you may complain, everything is clear except the main thing. How does one find out what the meanings are? The answer, though simple, may appear unsatisfactory. But patience and practice will show you otherwise. The answer is that *you have to discover the meaning of a word you do not understand by using the meanings of all the other words in the context that you do understand*. This must be the way, no matter how merry-go-roundish it may seem at first.

The easiest way to illustrate this is to consider a definition. A definition is stated in words. If you do not understand any of the words used in the definition, you obviously cannot understand the meaning of the word that names the thing defined. The word "point" is a basic word in geometry. You may think you know what it means (in geometry), but Euclid wants to be sure you use it in only one way. He tells you what he means by first defining the thing he is later going to use the word to name. He says: "A point is that which has no part."

How does that help to bring you to terms with him? You know, he assumes, what every other word in the sentence means with sufficient precision. You know that whatever has parts is a complex whole. You know that the opposite of complex is simple. To be simple is the same as to lack parts. You know that the use of the words "is" and "that which" means that the thing referred to must be an entity of some sort. Incidentally, it follows from all this that, if there are no physical things without parts, a point, as Euclid speaks of it, cannot be physical.

This illustration is typical of the process by which you acquire meanings. You operate with meanings you already possess. If every word that was used in a definition had itself to be defined, nothing could ever be defined. If every word in a book you were reading was entirely strange to you, as in the case of a book in a totally foreign language, you could make no progress at all.

That is what people mean when they say of a book that it is all Greek to them. They simply have not tried to understand it, which would be justifiable if it were really in Greek. But most of the words in any English book are familiar words. These words surround the strange words, the technical words, the words that may cause the reader some trouble. The surrounding words are the *context* for the words to be interpreted. The reader has all the materials he needs to do the job.

We are not pretending the job is an easy one. We are only insisting that it is not an impossible one. If it were, no one could read a book to gain in understanding. The fact that a book can give you new insights or enlighten you indicates that it probably contains words you may not readily understand. If you could not come to understand those words by your own efforts, then the kind of reading we are talking about would be impossible. It would be impossible to pass from understanding less to understanding more by your own operations on a book.

There is no rule of thumb for doing this. The process is something like the trial-and-error method of putting a jigsaw puzzle together. The more parts you put together, the easier it is to find places for the remaining parts, if only because there are fewer of them. A book comes to you with a large number of words already in place. *A word in place is a term.* It is definitely located by the meaning that you and the author share in using it. The remaining words must be put in place. You do this by trying to make them fit this way or that. The better you understand the picture that the words so far in place already partially reveal, the easier it is to complete the picture by making terms of the remaining words. Each word put into place makes the next adjustment easier.

You will make errors, of course, in the process. You will think you have managed to find where a word belongs and how it fits, only to discover later that the placement of another word requires you to make a whole series of readjustments. The errors will get corrected because, so long as they are not found out, the picture cannot be completed. Once you have had any experience at all in this work of coming to terms, you will soon be able to check yourself. You will know whether you have succeeded or not. You will not blithely think you understand when you do not.

In comparing a book to a jigsaw puzzle, we have made one assumption that is not true. A good puzzle is, of course, one all of whose parts fit. The picture can be perfectly completed. The same is true of the ideally good book, but there is no such book. In proportion as books are good, their terms will be so well made and put together by the author that the reader can do the work of interpretation fruitfully. Here, as in the case of every other rule of reading, bad books are less readable than good ones. The rules do not work on them, except to show you how bad they are. If the author uses words

ambiguously you cannot find out what he is trying to say. You can only find out that he has not been precise.

But, you may ask, does not an author who uses a word in more than a single sense use it ambiguously? And is it not the usual practice for authors to use words in several senses, especially their most important words?

The answer to the first question is No; to the second, Yes. To use a word ambiguously is to use it in several senses without distinguishing or relating their meanings. (For example, we have probably used the word “important” ambiguously in this chapter, for we were not always clear as to whether we meant important for the author or important for you.) The author who does that has not made terms that the reader can come to. But the author who distinguishes the several senses in which he is using a critical word and enables the reader to make a responsive discrimination is offering terms.

You should not forget that one word can represent several terms. One way to remember this is to distinguish between the author’s *vocabulary* and his *terminology*. If you make a list in one column of the important words, and in another of their important meanings, you will see the relation between the vocabulary and the terminology.

There are several further complications. In the first place, a word that has several distinct meanings can be used either in a single sense or in a combination of senses. Let us take the word “reading” again as an example. In some places, we have used it to stand for reading any kind of book. In others, we have used it to stand for reading books that instruct rather than entertain. In still others, we have used it to stand for reading that enlightens rather than informs.

Now if we symbolise here, as we did before, these three distinct meanings of “reading” by Xa , Xb , and Xc , then the first usage just mentioned is $Xabc$, the second is Xbc , and the third Xc . In other words, if several meanings are related, one can use a word to stand for all of them, for some of them, or for only one of them at a time. So long as each usage is definite, the word so used is a term.

In the second place, there is the problem of synonyms. The repetition of a single word over and over is awkward and boring, except in mathematical writing, and so good authors often substitute different words having the same or very similar meanings for important words in their text. This is just the opposite of the situation where one word can stand for several terms; here, one and the same term is represented by two or more words used synonymously.

We can express this symbolically as follows. Let X and Y be two different words, such as “enlightenment” and “insight.” Let the letter a stand for the same meaning that each can express, namely, a gain in understanding. Then Xa and Ya represent the same term, though they are distinct as words. When we speak of reading “for insight” and reading “for enlightenment,” we are referring to the same kind of reading, because the two phrases are

being used with the same meaning. The words are different, but there is only one term for you as a reader to grasp.

This is important, of course. If you supposed that every time an author changed his words, he was shifting his terms, you would make as great an error as to suppose that every time he used the same words, the terms remained the same. Keep this in mind when you list the author's vocabulary and terminology in separate columns. You will find two relationships. On the one hand, a single word may be related to several terms. On the other hand, a single term may be related to several words.

In the third place, and finally, there is the matter of phrases. If a phrase is a unit, that is, if it is a whole that can be the subject or predicate of a sentence; it is like a single word. Like a single word, it can refer to something being talked about in some way.

It follows, therefore, that a term can be expressed by a phrase as well as by a word. And all the relations that exist between words and terms hold also between terms and phrases. Two phrases may express the same term, and one phrase may express several terms, according to the way its constituent words are used.

In general, a phrase is less likely to be ambiguous than a word. Because it is a group of words, each of which is in the context of the others, the single words are more likely to have restricted meanings. That is why a writer is likely to substitute a fairly elaborate phrase for a single word if he wants to be sure that you get his meaning.

One illustration should suffice. To be sure that you come to terms with us about reading, we substitute phrases like "reading for enlightenment" for the single word "reading." To make doubly sure, we may substitute a more elaborate phrase, such as "the process of passing from understanding less to understanding more by the operation of your mind upon a book." There is only one term here, a term referring to the kind of reading that this book is mostly about. But that one term has been expressed by a single word, a short phrase, and a longer one.

This has been a hard chapter to write, and probably a hard one to read. The reason is clear. The rule of reading we have been discussing cannot be made fully intelligible without going into all sorts of grammatical and logical explanations about words and terms.

In fact, we have actually done very little explaining. To give an adequate account of these matters would take many chapters. We have merely touched upon the most essential points. We hope we have said enough to make the rule a useful guide in practice. The more you put it into practice, the more you will appreciate the intricacies of the problem. You will want to know something about the literal and metaphorical use of words. You will want to know about the distinction between abstract and concrete words, and between proper and common names. You will become interested in the whole business of definition: the difference between defining words and defining things; why some words are indefinable, and yet have definite meanings, and so forth. You will seek light on what is called "the emotive use of words," that is, the use of words to arouse

emotions, to move men to action or change their minds, as distinct from the communication of knowledge. And you may even become interested in the relation between ordinary “rational” speech and “bizarre” or “crazy” talk—the speech of the mentally disturbed, where almost every word carries weird and unexpected but nevertheless identifiable connotations.

If the practice of analytical reading elicits these further interests, you will be in a position to satisfy them by reading books on these special subjects. And you will profit more from reading such books, because you will go to them with questions born of your own experience in reading. The study of grammar and logic, the sciences that underlie these rules, is practical only to the extent you can relate it to practice.

You may never wish to go further. But even if you do not, you will find that your comprehension of any book will be enormously increased if you only go to the trouble of finding its important words, identifying their shifting meanings, and coming to terms. Seldom does such a small change in a habit have such a large effect.

Rules 13 Review and analyze text in logical way. There are number of things I will look when analyse and review text in Logical way:

Inspectional Reading VI: Superficial Reading

1. Skimming through Audiobook between 190 words per minute to 375 words per minute or between 1.25-2.5 times speed
2. Normally listen audiobook from beginning to end between 190 words per minute to 285 words per minute or between 1.25-1.9 times speed
3. Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed
4. Read or Listen The Full Book Without Stopping
5. Read or listen 25min and 5min break
 - Read or Listen 20 pages an Hour according Mortimer Adler
6. Read or Listen between 1-50 times the book
7. Speed of Audiobook
 - Normally listen audiobook from beginning to end between 150 words per minute to 300 words per minute or between 1-2 times speed
8. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.
9. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem.
10. With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at different speeds—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

Determining an Author's Message

Not only coming to terms but also making propositions occurs among traders as well as in the world of books. What a buyer or seller means by a proposition is some sort of proposal, some sort of offer or acceptance. In honest dealings, the person who makes a proposition in this sense is declaring his intention to act in a certain way. More than honesty is required for successful negotiations. The proposition should be clear and, of course, attractive. Then the traders can come to terms.

A proposition in a book is also a declaration. It is an expression of the author's judgment about something. He affirms something he thinks to be true, or denies something he judges to be false. He asserts this or that to be a fact. A proposition of this sort is a declaration of knowledge, not intentions. The author may tell us his intentions at the beginning in a preface. In an expository book, he usually promises to instruct us about something. To find out whether he keeps those promises, we must look for his propositions.

Generally, the order of reading reverses the order of business. Businessmen usually come to terms after they find out what the proposition is. But the reader must usually come to terms with an author first, before he can find out what the author is proposing, what judgment he is declaring. That is why the fifth rule of analytical reading concerns words and terms, and the sixth, which we are about to discuss, concerns sentences and propositions.

There is a seventh rule that is closely related to the sixth. The author may be honest in declaring himself on matters of fact or knowledge. We usually proceed in that trust. But unless we are exclusively interested in the author's personality, we should not be satisfied with knowing what his opinions are. *His propositions are nothing but expressions of personal opinion unless they are supported by reasons.* If it is the book and the subject with which it deals that we are interested in, and not just the author, we want to know not merely what his propositions are, but *also why he thinks we should be persuaded to accept them.*

The seventh rule, therefore, deals with arguments of all sorts. There are many kinds of reasoning, many ways of supporting what one says. Sometimes it is possible to argue that something is true; sometimes no more than a probability can be defended. But every sort of argument consists of a number of statements related in a certain way. *This* is said *because of that*. The word "because" here signifies a reason being given.

The presence of arguments is indicated by other words that relate statements, such as: *if* this is so, *then* that; or, *since* this, *therefore* that; or, it *follows* from this, that that is the case. In the course of earlier chapters in this book, such sequences occurred. For those of us who are no longer in school, we observed, it is necessary, if we want to go on learning and discovering, to know how to make books teach us well. In that situation, *if* we want to go on learning, *then* we must know how to learn from books, which are absent teachers.

An argument is always a set or series of statements of which some provide the grounds or reasons for what is to be concluded. A paragraph, therefore, or at least a collection of sentences, is required to express an argument. The premises or principles of an argument may not always be stated first, but they are the *source* of the conclusion, nevertheless. If the argument is valid, the conclusion follows from the premises. That does not necessarily mean that the conclusion is true, since one or all of the premises that support it may be false.

There is a grammatical as well as a logical aspect to the order of these rules of interpretation. We go from terms to propositions to arguments, by going from words (and phrases) to sentences to collections of sentences (or paragraphs). We are building up from simpler to more complex units. The smallest significant element in a book is, of course, a single word. It would be true but not adequate to say that a book consists of words. It also consists of groups of words, taken as units, and similarly of groups of sentences, taken as units. The active reader is attentive not only to the words but also to the sentences and paragraphs. There is no other way of discovering the author's terms, propositions, and arguments.

The movement at this stage of analytical reading—*when interpretation is our goal*—seems to be in the opposite direction from the movement in the first stage—*when the goal was a structural outline*. There we went from the book as a whole to its major parts, and then to their subordinate divisions. As you might suspect, the two movements meet somewhere. The major parts of a book and their principal divisions contain many propositions and usually several arguments. But if you keep on dividing the book into its parts, at last you have to say: "In this part, the following points are made." Now each of these points is likely to be a proposition, and some of them taken together probably form an argument.

Thus, the two processes, outlining and interpretation, meet at the level of propositions and arguments. You work down to propositions and arguments by dividing the book into its parts. You work up to arguments by seeing how they are composed of propositions and ultimately of terms. When you have completed the two processes, you can really say that you know the contents of a book.

Sentences vs. Propositions

We have already noticed another thing about the rules we are going to discuss in this chapter. As in the case of the rule about words and terms, we are here also dealing with the relation of language and thought. Sentences and paragraphs are grammatical units. They are units of language. Propositions and arguments are logical units, or units of thought and knowledge.

We have to face here a problem similar to the one we faced in the last chapter. Because language is not a perfect medium for the expression of thought, because one word can have many meanings and two or more words can have the same meaning, we saw how complicated was the relation between an author's *vocabulary* and his *terminology*. One word may represent several terms, and one term may be represented by several words.

Mathematicians describe the relation between the buttons and the buttonholes on a well-made coat as a one-to-one relationship. There is a button for every buttonhole, and a hole for every button. Well, the point is that words and terms do *not* stand in a one-to-one relation. The greatest error you can make in applying these rules is to suppose that a one-to-one relationship exists between the elements of language and those of thought or knowledge.

As a matter of fact, it would be wise not to make too easy assumptions even about buttons and buttonholes. The sleeves of most men's suit jackets bear buttons that have no corresponding buttonholes. And if you have worn the coat for a while, it may have a hole with no corresponding button.

Let us illustrate this in the case of sentences and propositions. Not every sentence in a book expresses a proposition. For one thing, some sentences express questions. They state problems rather than answers. *Propositions are the answers to questions*. They are declarations of knowledge or opinion. That is why we call sentences that express them declarative, and distinguish sentences that ask questions as interrogative. Other sentences express wishes or intentions. They may give us some knowledge of the author's purpose, but they do not convey the knowledge he is trying to expound.

Moreover, not all the declarative sentences can be read as if each expressed one proposition. There are at least two reasons for this. The first is the fact that words are ambiguous and can be used in various sentences. Thus, it is possible for the same sentence to express different propositions if there is a shift in the terms the words express. "Reading is learning" is a simple sentence; but if at one place we mean by "learning" the acquisition of information, and at another we mean the development of understanding, the proposition is not the same, because the terms are different. Yet the sentence is the same.

The second reason is that all sentences are not as simple as "Reading is learning." When its words are used unambiguously, a simple sentence *usually* expresses a single proposition. But even when its words are used unambiguously, a compound sentence expresses two or more propositions. A compound sentence is really a collection of

sentences, connected by such words as “and,” or “if . . . then,” or “not only . . . but also.” You may rightly conclude that the line between a long compound sentence and a short paragraph may be difficult to draw. A compound sentence can express a number of propositions related in the form of an argument.

Such sentences can be very difficult to interpret. Let us take an interesting sentence from Machiavelli’s *The Prince* to show what we mean:

A prince ought to inspire fear in such a way that, if he does not win love, he avoids hatred; because he can endure very well being feared whilst he is not hated, which will always be as long as he abstains from the property of his citizens and from their women.

This is grammatically a *single* sentence, though it is extremely complex. The semicolon and the “because” indicate the major break in it. The first proposition is that a prince ought to inspire fear in a certain way.

Beginning with the word “because,” we have what is in effect another sentence. (It could be made independent by saying: “The reason for this is that he can endure,” and so forth.) And this sentence expresses two propositions at least: (1) the reason why the prince ought to inspire fear in a certain way is that he can endure being feared so long as he is not hated; (2) he can avoid being hated only by keeping his hands off the property of his citizens and their women.

It is important to distinguish the various propositions that a long, complex sentence contains. In order to agree or disagree with Machiavelli, you must first understand what he is saying. But he is saying three things in this one sentence. You may disagree with one of them and agree with the others. You may think Machiavelli is wrong in recommending terrorism to a prince on any grounds; but you may acknowledge his shrewdness in saying that the prince had better not arouse hatred along with fear, and you may also agree that keeping his hands off his subjects’ property and women is an indispensable condition of not being hated. Unless you recognize the distinct propositions in a complicated sentence, you cannot make a discriminating judgment on what the writer is saying.

Lawyers know this fact very well. They have to examine sentences carefully to see what is being alleged by the plaintiff or denied by the defendant. The single sentence, “John Doe signed the lease on March 24,” looks simple enough, but still it says several things, some of which may be true and the others false. John Doe may have signed the lease, but not on March 24, and that fact may be important. In short, even a grammatically simple sentence sometimes expresses two or more propositions.

We have said enough to indicate what we mean by the difference between sentences and propositions. They are not related as one to one. Not only can a single sentence express several propositions, either through ambiguity or complexity, but one and the same proposition can also be expressed by two or more different sentences. If you grasp our terms through the words and phrases we use synonymously, you will know that we are

saying the same thing when we say, “Teaching and being taught are correlative functions,” and “Initiating and receiving communication are related processes.”

We are going to stop explaining the grammatical and logical points involved and turn to the rules. The difficulty in this chapter, as in the last, is to stop explaining. Instead, we will assume that you know some grammar. We do not necessarily mean that you must understand everything about syntax, but you should be concerned about the ordering of words in sentences and their relation to one another. Some knowledge of grammar is indispensable to a reader. You cannot begin to deal with terms, propositions, and arguments—the elements of thought—until you can penetrate beneath the surface of language. So long as words, sentences, and paragraphs are opaque and unanalyzed, they are a barrier to, rather than a medium of, communication. You will read words but not receive knowledge.

Here are the rules. The tenth rule of reading, as you will recall from the last

RULE 14. FIND THE IMPORTANT WORDS AND COME TO TERMS. The TENTH rule can be expressed thus:

RULE 15. MARK THE MOST IMPORTANT SENTENCES IN A BOOK AND DISCOVER THE PROPOSITIONS THEY CONTAIN. The seventh rule is this:

RULE 16. LOCATE OR CONSTRUCT THE BASIC ARGUMENTS IN THE BOOK BY FINDING THEM IN THE CONNECTION OF SENTENCES. You will see later why we did not say “paragraphs” in the formulation of this rule.

Incidentally, it is just as true of these new rules as it was of the rule about coming to terms that they apply primarily to expository works. The rules about propositions and arguments are quite different when you are reading a poetical work—a novel, play, or poem. We will discuss the changes that are required in applying them to such works later.

Finding the Key Sentences

Rule 15. MARK THE MOST IMPORTANT SENTENCES IN A BOOK AND DISCOVER THE PROPOSITION THEY CONTAIN.

How does one locate the most important sentences in a book? How, then, does one interpret these sentences to discover the one or more propositions they contain?

Again, we are placing emphasis on what is important. To say that there is only a relatively small number of key sentences in a book does not mean that you need pay no attention to all the rest. Obviously, you have to understand every sentence. But most of the sentences, like most of the words, will cause you no difficulty. As we pointed out in our discussion of reading speeds, you will read them relatively quickly. From your point of view as a reader, the sentences important *for you* are those that require an effort of interpretation because, at first sight, they are not perfectly intelligible. You understand them just well enough to know there is more to understand. They are the sentences that you read much more slowly and carefully than the rest. These may not be the sentences that are most important *for the author*, but they are likely to be, because you are likely to have the greatest difficulty with the most important things the author has to say. And it hardly needs remarking that those are the things you should read most carefully.

From the author's point of view, the important sentences are the ones that express the judgments on which his whole argument rests. A book usually contains much more than the bare statement of an argument, or a series of arguments. The author may explain how he came to the point of view he now holds, or why he thinks his position has serious consequences. He may discuss the words he has to use. He may comment on the work of others. He may indulge in all sorts of supporting and surrounding discussion. But *the heart of his communication lies in the major affirmations and denials he is making, and the reasons he gives for so doing*. To come to grips, therefore, you have to see the main sentences as if they were raised from the page in high relief.

Some authors help you do this. They underline the sentences for you. They either tell you that this is an important point when they make it, or they use one or another typographical device to make their leading sentences stand out. Of course, nothing helps those who will not keep awake while reading. We have met many readers and students who paid no attention even to such clear signs. They preferred to read on rather than stop and examine the important sentences carefully.

There are a few books in which the leading propositions are set forth in sentences that occupy a special place in the order and style of the exposition. Euclid, again, gives us the most obvious example of this. He not only states his definitions, his postulates, and his axioms—his principal propositions—at the beginning, but he also labels every proposition to be proved. You may not understand all of his statements. You may not follow all of his arguments. But you cannot miss the important sentences or the grouping of sentences for the statement of the proofs.

The *Summa Theologica* of St. Thomas Aquinas is another book whose style of exposition puts the leading sentences into high relief. It proceeds by raising questions. Each section is headed by a question. There are many indications of the answer that Aquinas is trying to defend. A whole series of objections opposing the answer is stated. The place where Aquinas begins to argue his own point is marked by the words, "I answer that." There is no excuse for not being able to locate the important sentences in such a book—those expressing the reasons as well as the conclusions—yet even here it remains all a blur for those readers who treat everything they read as equally important—and read it all at the same speed, either fast or slow. That usually means that everything is equally unimportant.

Apart from books whose style or format calls attention to what most needs interpretation by the reader, the spotting of the important sentences is a job the reader must perform for himself. There are several things he can do. We have already mentioned one. If he is sensitive to the difference between passages he can understand readily and those he cannot, he will probably be able to locate the sentences that carry the main burden of meaning. Perhaps you are beginning to see how essential a part of reading it is to *be perplexed and know it*. Wonder is the beginning of wisdom in learning from books as well as from nature. If you never ask yourself any questions about the meaning of a passage, you cannot expect the book to give you any insight you do not already possess.

Another clue to the important sentences is found in the words that compose them. If you have already marked the important words, they should lead you to the sentences that deserve further attention. Thus the first step in interpretive reading prepares for the second. But the reverse may also be the case. It may be that you will mark certain words only after you have become puzzled by the meaning of a sentence. The fact that we have stated these rules in a fixed order does not mean that you have to follow them in that order. Terms constitute propositions. Propositions contain terms. If you know the terms the words express, you have caught the proposition in the sentence. If you understand the proposition conveyed by a sentence, you have arrived at the terms also.

This suggests one further clue to the location of the principal propositions. They must belong to the main argument of the book. They must be either premises or conclusions. Hence, if you can detect those sentences that seem to form a sequence, a sequence in which there is a beginning and an end, you probably have put your finger on the sentences that are important.

We said a sequence in which there is a beginning and an end. Every argument that men can express in words takes time to state. You may speak a sentence in one breath, but there are pauses in an argument. You have to say one thing first, then another, and then another. An argument begins somewhere, goes somewhere, gets somewhere. It is a movement of thought. It may begin with what is really the conclusion and then proceed to give the reasons for it. Or it may start with the evidence and the reasons and bring you to the conclusion that follows therefrom.

Of course, here as elsewhere, the clue will not work unless you know how to use it. You have to recognize an argument when you see one. Despite some disappointing

experiences, however, we persist in our opinion that the human mind is as naturally sensitive to arguments as the eye is to colors. (There may be some people who are argument-blind!) But the eye will not see if it is not kept open, and the mind will not follow an argument if it is not awake.

Many persons believe that they know how to read because they read at different speeds. But they pause and go slow *over the wrong sentences*. They pause over the sentences that *interest* them rather than the ones that *puzzle* them. Indeed, this is one of the greatest obstacles to reading a book that is not completely contemporary. Any old book contains facts that are somewhat surprising because they are different from what we know. But when you are reading for understanding it is not that kind of novelty that you are seeking. Your interest in the author himself, or in his language, or in the world in which he wrote, is one thing; your concern to understand his ideas is quite another. It is this concern that the rules we are discussing here can help you to satisfy, not your curiosity about other matters.

Finding the Propositions

Rules 16 Review and analyze text in logical way. There are number of things I will look when analyse and review text in Logical way:

- A. Basic Concepts.
- B. Language and definition.
- C. Informal Fallacies.
- D. Categorical Propositions.
- E. Categorical Syllogism.
- F. Propositional Logic.
- G. Natural Deduction in Propositional Logic.
- H. Predicate Logic.
- I. Analogy and Legal and Moral Reasoning.
- J. Causality and Mill's Reasoning.
- K. Probability.
- L. Statistical Reasoning.
- M. Hypothetical Scientific Reasoning.

13. Logic Complete Introduction.

14. Socratic Logic A Logic Text using Socratic Method, Platonic Questions, and Aristotelian Principles.

15. Complete Works By Aristotle.

Let us suppose that you have located the leading sentences. Another step is required by **Rule 16**. You must discover the proposition or propositions that each of these sentences contains. This is just another way of saying that you must know what the sentence means. You discover terms by discovering what a word means in a given usage. You discover propositions similarly by interpreting all the words that make up the sentence, and especially its principal words.

Once more, you cannot do this very well unless you know a little grammar. You must know the role that adjectives and adverbs play, how verbs function in relation to nouns, how modifying words and clauses restrict or amplify the meaning of the words they modify, and so forth. Ideally, you should be able to dissect a sentence according to the rules of syntax, although you do not necessarily have to do it in a formal way. Despite the current de-emphasis on teaching grammar in school, we have to assume that you know this much of it. We cannot believe you do not, though you may have grown a little rusty from lack of practice in the rudiments of the art of reading.

There are only two differences between finding the terms that words express and the propositions that sentences express. One is that you employ a larger context in the latter case. You bring all the surrounding sentences to bear on the sentence in question, just as you used the surrounding words to interpret a particular word. In both cases, you proceed from what you do understand to the gradual elucidation of what is at first relatively unintelligible.

The other difference lies in the fact that complicated sentences usually express more than one proposition. You have not completed your interpretation of an important sentence until you have separated out of it all the different, though perhaps related, propositions. Skill in doing this comes with practice. Take some of the complicated sentences in this book and try to state in your own words each of the things that is being asserted. Number them and relate them.

“State in your own words!” That suggests the best test we know for telling whether you have understood the proposition or propositions in the sentence. If, when you are asked to explain what the author means by a particular sentence, all you can do is repeat his very words, with some minor alterations in their order, you had better suspect that you do not know what he means. Ideally, you should be able to say the same thing in totally different words. The idea can, of course, be approximated in varying degrees. But if you cannot get away at all from the author’s words, it shows that *only words* have passed from him to you, *not thought or knowledge*. You know his words, not his mind. He was trying to communicate knowledge, and all you received was words.

The process of translation from a foreign language to English is relevant to the test we have suggested. If you cannot state in an English sentence what a French sentence says, you know you do not understand the meaning of the French. But even if you can, your translation may remain only on the verbal level; for even when you have formed a faithful English replica, you still may not know what the writer of the French sentence was trying to convey.

The translation of one English sentence into another, however, is not merely verbal. The new sentence you have formed is not a verbal replica of the original. If accurate, *it is faithful to the thought alone*. That is why making such translations is the best test you can apply to yourself, if you want to be sure you have digested the proposition, not merely swallowed the words. If you fail the test, you have uncovered a failure of understanding. If you say that you know what the author means, but can only repeat the author's sentence to show that you do, then you would not be able to recognize the author's proposition if it were presented to you in other words.

The author may himself express the same proposition in different words in the course of his writing. The reader who has not seen through the words to the proposition they convey is likely to treat the equivalent sentences as if they were statements of different propositions. Imagine a person who did not know that " $2 + 2 = 4$ " and " $4 - 2 = 2$ " were different notations for the same arithmetic relationship—the relationship of four as the double of two, or two as the half of four.

You would have to conclude that that person simply did not understand the equation. The same conclusion is forced on you concerning yourself or anybody else who cannot tell when equivalent statements of the same proposition are being made, or who cannot himself offer an equivalent statement when he claims to understand the proposition a sentence contains.

These remarks have a bearing on syntopical reading—the reading of several books about the same subject matter. Different authors frequently say the same thing in different words, or different things using almost the same words. The reader who cannot see through the language to the terms and propositions will never be able to compare such related works. Because of their verbal differences, he is likely to misread the authors as disagreeing, or to ignore their real differences because of verbal resemblances in their statements.

There is one other test of whether you understand the proposition in a sentence you have read. Can you point to some experience you have had that the proposition describes or to which the proposition is in any way relevant? Can you exemplify the general truth that has been enunciated by referring to a particular instance of it? To imagine a possible case is often as good as citing an actual one. If you cannot do anything at all to exemplify or illustrate the proposition, either imaginatively or by reference to actual experiences, you should suspect that you do not know what is being said.

Not all propositions are equally susceptible to this test. It may be necessary to have the special experience that only a laboratory can afford to be sure you have grasped certain scientific propositions. But the main point is clear. Propositions do not exist in a vacuum. They refer to the world in which we live. Unless you can show some acquaintance with actual or possible facts to which the proposition refers or is relevant somehow, you are *playing with words*, not dealing with thought and knowledge.

Let us consider one example of this. A basic proposition in metaphysics is expressed by the following words: “Nothing acts except what is actual.” We have heard many students repeat those words to us with an air of satisfied wisdom. They have thought they were discharging their duty to us and to the author by so perfect a verbal repetition. But the sham was obvious as soon as we asked them to state the proposition in other words. Seldom could they say, for instance, that if something does not exist, it cannot do anything. Yet this is an immediately apparent translation —apparent, at least, to anyone who understood the proposition in the original sense.

Failing to get a translation, we would then ask for an exemplification of the proposition. If any one of them told us that grass is not made to grow by merely *possible* showers—that one’s bank account does not increase on account of a merely *possible* raise—we would know that the proposition had been grasped.

The vice of “verbalism” can be defined as the bad habit of using words without regard for the thoughts they should convey and without awareness of the experiences to which they should refer. It is playing with words. As the two tests we have suggested indicate, “verbalism” is the besetting sin of those who fail to read analytically. Such readers never get beyond the words. They possess what they read as a verbal memory that they can recite empty. One of the charges made by certain modern educators against the liberal arts is that they tend to verbalism, but just the opposite seems to be the case. The failure in reading—the omnipresent verbalism— of those who have not been trained in the arts of grammar and logic shows how lack of such discipline results in slavery to words rather than mastery of them.

Inspectional Reading VII: Superficial Reading

1. Skimming through Audiobook between 190 words per minute to 375 words per minute or between 1.25-2.5 times speed
2. Normally listen audiobook from beginning to end between 190 words per minute to 285 words per minute or between 1.25-1.9 times speed
3. Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed
4. Read or Listen The Full Book Without Stopping
5. Read or listen 25min and 5min break
 - Read or Listen 20 pages an Hour according Mortimer Adler
6. Read or Listen between 1-50 times the book
7. Speed of Audiobook
 - Normally listen audiobook from beginning to end between 150 words per minute to 300 words per minute or between 1-2 times speed.
8. A good speed reading course should therefore teach you to read at many different speeds, not just one speed that is faster than anything you can manage now. It should enable you to vary your rate of reading in accordance with the nature and complexity of the material.
9. Many books are hardly worth even skimming; some should be read quickly; and a few should be read at a rate, usually quite slow, that allows for complete comprehension. It is wasteful to read a book slowly that deserves only a fast reading; speed reading skills can help you solve that problem.
10. With regard to rates of reading, then, the ideal is not merely to be able to read faster, but to be able to read at different speeds—and to know when the different speeds are appropriate. Inspectional reading is accomplished quickly, but that is not only because you read faster, although in fact you do; it is also because you read less of a book when you give it an inspectional reading, and because you read it in a different way, with different goals in mind. Analytical reading is ordinarily much slower than inspectional reading, but even when you are giving a book an analytical reading, you should not read all of it at the same rate of speed. Every book, no matter how difficult, contains interstitial material that can be and should be read quickly; and every good book also contains matter that is difficult and should be read very slowly.

Finding the Arguments

Rule 18. Know the author's arguments, by finding them in, or constructing them out of, sequences of sentences.

The author may be honest in declaring himself on matters of fact or knowledge. We usually proceed in that trust. But unless we are exclusively interested in the author's personality, we should not be satisfied with knowing what his opinions are. His propositions are nothing but expressions of personal opinion unless they are supported by reasons. If it is the book and the subject with which it deals that we are interested in, and not just the author, we want to know not merely what his propositions are, but also why he thinks we should be persuaded to accept them.

The seventeenth rule, therefore, deals with arguments of all sorts. There are many kinds of reasoning, many ways of supporting what one says. Sometimes it is possible to argue that something is true; sometimes no more than a probability can be defended. But every sort of argument consists of a number of statements related in a certain way. This is said because of that. The word "because" here signifies a reason being given.

The presence of arguments is indicated by other words that relate statements, such as: if this is so, then that; or, since this, therefore that; or, it follows from this, that that is the case. In the course of earlier chapters in this book, such sequences occurred. For those of us who are no longer in school, we observed, it is necessary, if we want to go on learning and discovering, to know how to make books teach us well. In that situation, if we want to go on learning, then we must know how to learn from books, which are absent teachers.

The presence of arguments is indicated by other words that relate statements, such as: if this is so, then that; or, since this, therefore that; or, it follows from this, that that is the case. In the course of earlier chapters in this book, such sequences occurred. For those of us who are no longer in school, we observed, it is necessary, if we want to go on learning and discovering, to know how to make books teach us well. In that situation, if we want to go on learning, then we must know how to learn from books, which are absent teachers.

An argument is always a set or series of statements of which some provide the grounds or reasons for what is to be concluded. A paragraph, therefore, or at least a collection of sentences, is required to express an argument. The premises or principles of an argument may not always be stated first, but they are the source of the conclusion, nevertheless. If the argument is valid, the conclusion follows from the premises. That does not necessarily mean that the conclusion is true, since one or all of the premises that support it may be false.

Not every sentence in a book expresses a proposition. For one thing, some sentences express questions. They state problems rather than answers. Propositions are the answers to questions. They are declarations of knowledge or opinion. That is why we call sentences that express them declarative, and distinguish sentences that ask questions as interrogative. Other sentences express wishes or intentions. They may give us some knowledge of the author's purpose, but they do not convey the knowledge he is trying to expound.

Moreover, not all the declarative sentences can be read as if each expressed one proposition. There are at least two reasons for this. The first is the fact that words are ambiguous and can be used in various sentences. Thus, it is possible for the same sentence to express different propositions if there is a shift in the terms the words express. "Reading is learning" is a simple sentence; but if at one place we mean by "learning" the acquisition of information, and at another we mean the development of understanding, the proposition is not the same, because the terms are different. Yet the sentence is the same. The second reason is that all sentences are not as simple as "Reading is learning." When its words are used unambiguously, a simple sentence usually expresses a single proposition. But even when its words are used unambiguously, a compound sentence expresses two or more propositions. A compound sentence is really a collection of sentences, connected by such words as "and," or "if . . . then," or "not only . . . but also." You may rightly conclude that the line between a long compound sentence and a short paragraph may be difficult to draw. A compound sentence can express a number of propositions related in the form of an argument.

We have spent enough time on propositions. Let us now turn to the seventh rule of analytical reading, which requires the reader to deal with collections of sentences. We said before that there was a reason for not formulating this rule of interpretation by saying that the reader should find the most important paragraphs. The reason is that there are no settled conventions among writers about how to construct paragraphs. Some great writers, such as Montaigne, Locke, or Proust, write extremely long paragraphs; others, such as Machiavelli, Hobbes, or Tolstoy, write relatively short ones. In recent times, under the influence of newspaper and magazine style, most writers tend to cut their paragraphs to fit quick and easy reading. This paragraph, for instance, is probably too long. If we had wanted to coddle our readers, we should have started a new one with the words, "Some great writers."

It is not merely a matter of length. The point that is troublesome here has to do with the relation between language and thought. The logical unit to which the seventh rule directs our reading is the argument—a sequence of propositions, some of which give reasons for another. This logical unit is not uniquely related to any recognizable unit of writing, as terms are related to words and phrases, and propositions to sentences. An

argument may be expressed in a single complicated sentence. Or it may be expressed in a number of sentences that are only part of one paragraph. Sometimes an argument may coincide with a paragraph, but it may also happen that an argument runs through several or many paragraphs.

There is one further difficulty. *There are many paragraphs in any book that do not express an argument at all*—perhaps not even part of one. They may consist of collections of sentences that detail evidence or report how the evidence has been gathered. As there are sentences that are of secondary importance, because they are merely digressions or side remarks, so also can there be paragraphs of this sort. It hardly needs to be said that they should be read rather quickly.

Because of all this, we suggest another formulation of RULE 19, as follows: FIND IF YOU CAN THE PARAGRAPHS IN A BOOK THAT STATE ITS IMPORTANT ARGUMENTS; BUT IF THE ARGUMENTS ARE NOT THUS EXPRESSED, YOUR TASK IS TO CONSTRUCT THEM, BY TAKING A SENTENCE FROM THIS PARAGRAPH, AND ONE FROM THAT, UNTIL YOU HAVE GATHERED TOGETHER THE SEQUENCE OF SENTENCES THAT STATE THE PROPOSITIONS THAT COMPOSE THE ARGUMENT.

After you have discovered the leading sentences, the construction of paragraphs should be relatively easy. There are various ways of doing this. You can do it by actually writing out on a piece of paper the propositions that together form an argument. But usually a better way, as we have already suggested, is to put numbers in the margin, together with other marks, to indicate the places where the sentences occur that should be tied together in a sequence.

Authors are more or less helpful to their readers in this matter of making the arguments plain. Good expository authors try to reveal, not conceal, their thought. Yet not even all good authors do this in the same way. Some, such as Euclid, Galileo, Newton (authors who write in a geometrical or mathematical style), come close to the ideal of making a single paragraph an argumentative unit. The style of most writing in non-mathematical fields tends to present two or more arguments in a single paragraph or to have an argument run through several.

In proportion as a book is more loosely constructed, the paragraphs tend to become more diffuse. You often have to search through all the paragraphs of a chapter to find the sentences you can construct into a statement of a single argument. Some books make you search in vain, and some do not even encourage the search.

A good book usually summarizes itself as its arguments develop. If the author summarizes his arguments for you at the end of a chapter, or at the end of an elaborate section, you should be able to look back over the preceding pages and find the materials he has brought together in the summary. In *The Origin of Species*, Darwin summarizes his whole argument for the reader in a last chapter, entitled “Recapitulation and Conclusion.” The reader who has worked through the book deserves that help. The one who has not cannot use it.

Incidentally, if you have inspected the book well before beginning to read it analytically, you will know whether the summary passages exist and if they do, where they are. You can then make the best possible use of them when interpreting the book.

Another sign of a bad or loosely constructed book is the omission of steps in an argument. Sometimes they can be omitted without damage or inconvenience, because the propositions left out can be generally supplied from the common knowledge of readers. But sometimes their omission is misleading, and may even be intended to mislead. One of the most familiar tricks of the orator or propagandist is to leave certain things unsaid, things that are highly relevant to the argument, but that might be challenged if they were made explicit. While we do not expect such devices in an honest author whose aim is to instruct us, it is nevertheless a sound maxim of careful reading to make every step in an argument explicit.

Whatever kind of book it is, your obligation as a reader remains the same. If the book contains arguments, you must know what they are, and be able to put them into a nutshell. Any good argument can be put into a nutshell. There are, of course, arguments built upon arguments. In the course of an elaborate analysis, one thing may be proved in order to prove another, and this may be used in turn to make a still further point. The units of reasoning, however, are single arguments. If you can find these in any book you are reading, you are not likely to miss the larger sequences.

This is all very well to say, you may object, but unless one knows the structure of arguments as a logician does, how can one be expected to find them in a book, or worse, to construct them when the author does not state them compactly in a single paragraph?

The answer is that it must be obvious that you do not have to know about arguments “as a logician does.” There are relatively few logicians in the world, for better or for worse. Most of the books that convey knowledge and can instruct us contain arguments. They are intended for the general reader, not for specialists in logic.

No great logical competence is needed to read these books. To repeat what we said before, the nature of the human mind is such that if it works at all during the process of reading, if it comes to terms with the author and reaches his propositions, it will see his arguments as well.

There are, however, a few things we can say that may be helpful to you in carrying out this rule of reading. *In the first place*, remember that every argument must involve a number of statements. Of these, some give the reasons why you should accept a conclusion the author is proposing. If you find the conclusion first, then look for the reasons. If you find the reasons first, see where they lead.

***In the second place*, discriminate between the kind of argument that points to one or more particular facts as evidence for some generalisation and the kind that offers a series of general statements to prove some further generalisations. The former kind of reasoning is usually referred to as inductive, the latter as deductive;**

but the names are not what is important. What is important is the ability to discriminate between the two.

In the literature of science, this distinction is observed whenever the difference is emphasized between the proof of a proposition by reasoning and its establishment by experiment. Galileo, in his *Two New Sciences*, speaks of illustrating by experiment conclusions that have already been reached by mathematical demonstration. And in a concluding chapter of his book *On the Motion of the Heart*, the great physiologist William Harvey writes: "It has been shown by reason and experiment that blood by the beat of the ventricles flows through the lungs and heart and is pumped to the whole body." Sometimes it is possible to support a proposition both by reasoning from other general truths and by offering experimental evidence. Sometimes only one method of argument is available.

In the third place, observe what things the author says he must assume, what he says can be proved or otherwise evidenced, and what need not be proved because it is self-evident. He may honestly try to tell you what all his assumptions are, or he may just as honestly leave you to find them out for yourself. Obviously, not everything can be proved, just as not everything can be defined. If every proposition had to be proved, there would be no beginning to any proof. Such things as axioms and assumptions or postulates are needed for the proof of other propositions. If these other propositions are proved, they can, of course, be used as premises in further proofs.

Every line of argument, in other words, must start somewhere. Basically, there are two ways or places in which it can start: with *assumptions* agreed on between writer and reader, or with what are called *self-evident propositions*, which neither the writer nor reader can deny. In the first case, the assumptions can be anything, so long as agreement exists. The second case requires some further comment here.

In recent times, it has become commonplace to refer to self-evident propositions as "tautologies"; the feeling behind the term is sometimes one of contempt for the trivial, or a suspicion of legerdemain. Rabbits are being pulled out of a hat. You put the truth in by defining your words, and then pull it out as if you were surprised to find it there. That, however, is not always the case.

For example, there is a considerable difference between a proposition such as "a father of a father is a grandfather," and a proposition such as "the whole is greater than its parts." The former statement *is* a tautology; the proposition is contained in the definition of the words; it only thinly conceals the verbal stipulation, "Let us call the parent of a parent a 'grandparent.' " But that is far from being the case with the second proposition. Let us try to see why.

The statement, "The whole is greater than its parts," expresses our understanding of things as they are and of their relationships, which would be the same no matter what words we used or how we set up our linguistic conventions. Finite quantitative wholes exist and they have definite finite parts; for example, this page can be cut in half or in quarters.

Now, as we understand a finite whole (that is, any finite whole) and as we understand a definite part of a finite whole, we understand the whole to be greater than the part, or the part to be less than the whole. So far is this from being a mere verbal matter that we cannot define the meaning of the words “whole” and “part”; these words express primitive or indefinable notions. As we are unable to define them *separately*, all we can do is express our understanding of whole and part by a statement of how wholes and parts are *related*.

The statement is axiomatic or self-evident in the sense that its opposite is immediately seen to be false. We can use the word “part” for this page, and the word “whole” for a half of this page after cutting it in two, but we cannot think that the page before it is cut is less than the half of it that we have in our hand after we have cut it. However we use language, our understanding of finite wholes and their definite parts is such that we are compelled to say that we know that the whole is greater than the part, and what we know is the relation between existent wholes and their parts, not something about the use of words or their meanings.

Such self-evident propositions, then, have the status of indemonstrable but also undeniable truths. They are based on common experience alone and are part of common-sense knowledge, for they belong to no organized body of knowledge; they do not belong to philosophy or mathematics any more than they belong to science or history. That is why, incidentally, Euclid called them “common notions.” They are also instructive, despite the fact that Locke, for example, did not think they were. He could see no difference between a proposition that really does not instruct, such as the one about the grandparent, and one that does—one that teaches us something we would not otherwise know—such as the one about parts and wholes. And those moderns who refer to all such propositions as tautologies make the same mistake. They do not see that some of the propositions they call “tautologies” really add to our knowledge, while others, of course, do not.

Rules 20 Review and analyze text in logical way. There are number of things I will look when analyse and review text in Logical way:

- A. Basic Concepts.
- B. Language and definition.
- C. Informal Fallacies.
- D. Categorical Propositions.
- E. Categorical Syllogism.

Rules 21-Premises, Conclusions, Assumptions, Arguments, Logic

A. Did the author used non arguments:

- Question.
- Command.
- Reports.
- Piece of advice.
- Warnings.
- Statements of belief.
- Statements of opinion.
- Explanation.
- Instructions.
- Expository passages.
- Loosely associated statement.

B. Make a list of arguments used by author, presenter, talker provided.

C. How many arguments have/has the author, presenter, talker provided?

D. What are the assumption of the author on the topic?

E. What are the premises of the author on the topic?

- Is the argument truth or false?

F. What are the premise indicators:

- Since- as indicated by.
- Because- the reason is that.
- For- for the reason that.
- As- may be inferred from.
- Follows from- may be derived from.
- As shown by- may be deduced from.
- Inasmuch as- in view of the facts that.
- On the assumption that.
- If.
- If we assume that.
- If we suppose that\in the view of the fact that.
- As shown by.
- As indicated by.
- The reason is that.
- For the reason that.
- For this reason.

G. What is the conclusion of the author on the topic?

H. What are the conclusion indicator?

- Therefore- for these reasons.
- Hence- it follows that.
- So- I conclude that.
- Accordingly- which shows that.
- In consequence- which means that.
- Consequently- which entails that.
- Proves that- which implies that.
- As a result- which allows us to infer that.
- For this reason- which points to the conclusion that.
- Thus- we may infer.
- It follows.
- Which shows.
- So.
- Then (after if).
- Indicates that.
- Implies that.
- Entails that.
- So you can see that.
- We can conclude that.
- We can infer that.
- We may deduce that.
- Points to the conclusion that.
- Which means that.
- Which shows that.
- Leads one to believe that.
- Bears out the point that.
- Proves that.
- Thus.
- As a result.
- Accordingly.
- For this reason (followed by a comma).

- I. What are the arguments of the author on the topic?
- Is the argument valid or invalid.
- J. How did the author came up with this conclusion?
- K. Use each chapter of the book while finding the arguments.
- Basic Concepts.
 - Language and definition.
 - Informal Fallacies.
 - Categorical Propositions.
 - Categorical Syllogism.
 - Propositional Logic.
 - Natural Deduction in Propositional Logic.
 - Predicate Logic.
 - Analogy and Legal and Moral Reasoning.
 - Causality and Mill's Reasoning.
 - Probability.
 - Statistical Reasoning.
 - Hypothetical Scientific Reasoning.
 - Science and Superstition.
- L. Did the author used:
- Philosophical Logic.
 - Mathematical Logic.
 - Computational Logic.
 - Formal Logic.
 - Informal Logic.
 - Inductive.
 - Deductive.
 - Propositional logic.
 - Predicate logic.
 - Modal logic.
 - Non classical logic.
 - Symbolic Logic.
- M. Did the Author diagrammed his own argument?
- N. Did the author diagrammed opposite arguments?

- O. Square of the Opposition.
- P. Contradictions.
- Q. Categorical propositions.
- R. Categorical Syllogism.
- S. Hypothetical Syllogism.
- T. Proof of Invalidity.
- U. Analogical Reasoning.
- V. Causal Reasoning.
- W. Cause and Effect.
- X. Use the following:.

- What?
- Who?
- Why?
- When?
- Where?
- How?
- How not?
- Do?
- Do not?
- Did?
- Did not?
- Can?
- Can not?
- May?
- May not?
- Might?
- Might not?
- Does?
- Does not?

Determining an Author's Logical Fallacies

Rules 22-Find the Fallacies if there is any

- A. List of the Logical fallacies used by the author, presenter, speaker, writer?
- B. What classification of fallacies did the author, speaker, presenter, writer used?
- C. What Logical fallacies did the author used?
- D. What are the evidence of the logical fallacies? Show in the book, presentation, articles etc.
- E. Review every single fallacy and review if they committed one of the fallacy.
- F. Be honest if they did and advise, where did they make the fallacy and show evidence where the proof of the fallacy.
- G. What are the reason of the logical fallacies? Show in the book, presentation, articles etc.
- H. Did the author used logical fallacy in any of the presentation, writing, speech, talk, discussion, debate etc.
- I. Give example of similar logical fallacies.
- J. Did the author used logical fallacy in any of the presentation, writing, speech, talk, discussion, debate etc.

Rules 23 Review and analyze text in logical way. There are number of things I will look when analyse and review text in Logical way:

- A. Basic Concepts.
- B. Language and definition.
- C. Informal Fallacies.
- D. Categorical Propositions.
- E. Categorical Syllogism.
- F. Propositional Logic.
- G. Natural Deduction in Propositional Logic.
- H. Predicate Logic.
- I. Analogy and Legal and Moral Reasoning.
- J. Causality and Mill's Reasoning.
- K. Probability.
- L. Statistical Reasoning.
- M. Hypothetical Scientific Reasoning.
- N. Science and Superstition.

Determining Context, Author's Facts and Evidence Supporting Argument

Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context?

Facts within The Context.

Rules 24 What are the Facts supporting Author's arguments

- A. Listen or reading Facts Within Context.
- B. What facts the author provided? Make a list.
- C. What author provided? Make a list.

Rules 25 What are the Figures supporting Author's arguments

- A. Listen or reading figures.
- B. What figures does the author provided? Make a list.
- C. What statistics does the author provided? Make a list.
- D. What formulas does the author provided? Make a list.
- E. What mathematical results the author provided? Make a list.
- F. What author provided? Make a list.

Rules 26 What are the evidence supporting Author's arguments

- A. Listen or reading Facts, figures and ideas.
- B. What evidence does the author provided? Make a list.
- C. What author provided? Make a list.

Rules 27 Do the Fact Checking

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Research the Facts, figures and ideas and do fact checking, if these are true or false through:
- Wikipedia
 - E-book
 - Books about autobiography and Biography
 - Websites
 - University

- C. Do full fact checking of the facts the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- D. Do full fact checking of the figures the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- E. Do full fact checking of the statistics the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- F. Do full fact checking of the formulas the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- G. Do full fact checking of the mathematical results the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- H. Do full fact checking of the evidences the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

- I. Any other information author provided do full fact checking.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

Author Bias and Unbiased

Rules 28 Bias vs Unbiased

- A. Listen and read if the author is biased or unbiased.
- B. Is the author best representative for one or another side?
- C. Is the author bias or not? What is the author's bias and purpose?
- D. Does the speaker or writer have personal or professional interest in the information they are presenting?
- E. How a writer might purposely present ideas or events in ways that favour a particular political party/organisation/religion/social group?
- F. Does the author presents facts and explain the ideas to reader or listener?
- G. Is the author uses facts and opinions to argue for or against some idea?
- H. Is the author tries to amuse or interest the reader with humour, suspense, intense and stories?
- I. Look at the language in the passage?
 - If it is neutral and objective, the purpose is probably simply to inform the reader?
 - If is includes terms and are strongly positive, negative or emotional, the purpose is probably to persuade the reader?
 - It is include situations or descriptions that are funny, surprising or intriguing the writer, probably wants to entertain the reader?
- J. Is the author biased?
 - Is the author presenting only one side of an argument?
 - Is it include only facts and examples that support writer's opinion?
 - Is it using the language intended to influence the reader's emotions?
 - Is it ridicules other opinions or views?
- K. Does the author have contradictory information, cherry picked evidence or carefully select language in which to present information favourably?
- L. Is the author or speaker speaks/writes for company, special interest group, an institute foundation think tank or political party?
- M. Does the author/writer gets paid or provided any gift for endorsement or opinion?
- N. Does the person have interest on this topic or has any personal gain? If not then this writer/speaker is disinterested, impartial/unbiased objective.
- O. If the speaker/writer has interest, then why does she/he present the information/ data in such a way?

- P. In surveys or studies has the author worded the question in such a way to ensure the sought-after response?
- Q. Is the company paid the author to prove that the device or product is better than any other product in the market?
- R. Is the marketer or industry trying to defend the product? Did the author put the best spin on its information?
- S. When was the survey or studies or experiment done?
- T. What day were the tests, survey or experiment done?
- U. Purpose of the author writing?
- V. How did the author handle opposing view? Is the author trying to persuade the reader to some belief?
- W. Does the author fairly handle the opposing view? Or did the author dismiss opposing points without regard to their possible value?
- X. Does the writer make any straw man fallacy, misrepresenting opposing view to more easily knock them down?
- Y. Did the author use slanted language or commit personal attack?
- Z. Does the writer use sweeping generalisation or demonstrate an either/or approach to complicated issues, thereby revealing a strong bias toward one side?
- AA. Does the writer pretend to be objective?
- BB. Does the writer intend to be ironic or satirical, if she or he is clearly exaggerating for effect?
- CC. Does the writer admit to guesswork and speculation?

Determining an Author's Sources

Rules 29 Sources the author used

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Listen or read what sources of information Author used
- C. What are the author's sources?
- Did the writer respond to those who have preceded them?
 - Has the writer depended on the primary/secondary/tertiary sources?
 - Has the writer misquoted the primary/secondary/tertiary or has he quoted the primary/secondary/tertiary source?
 - Has the writer uses statistics or data, has he used primary/secondary/tertiary source?
 - Has the writer interpreted the data or survey or statistics biased/unbiased?
 - Has the author correctly interpreted the information?
 - Has the author incorrectly interpreted information?
 - Search the very sources author uses and see if the author interpreted the information in correct way.
 - Has the author uses trust sources for the work he has written?
- D. Checking Each Fact's Sources, If they Are Reliable or Unreliable.

E. Sources

- Is the author uses primary source in presenting some data or facts in his/her newspaper, article, book journal?
 1. Is the primary source reliable, fair, ethical and trustworthy?
 2. Is the primary source sloppy, biased, unethical?
 3. Is the primary source objective when they speaking about certain subject?
 4. Are the primary source present facts carefully or careless?
 5. Is the primary source truthfully presenting the facts, opinions and data?
 6. Who is the writer? Is he /she qualified expert to write about this topic?
 7. Did the write done proper research regarding the topic?
 8. What is the tone?
 9. What is the purpose of publication?
 10. What assumption does the author make?
 11. What are the bases of author's conclusions?
 12. Does the author agree or disagree with other authors on the subject?
 13. Was this written in regards of the counterargument other authors who have opposite views?
 14. Does the content agree or disagree with author/authors on the subject?
 15. Does the content agree or disagree with what you know or have learned about the issue?
 16. Where was the source made?
 17. Where is the material from? Is this a valid source of information?

F. Is the Source Reliable or Unreliable?

- What primary sources did the author use. This is the list of primary source:
 1. Data and original research.
 2. Diaries and journals.
 3. Letters and memos.
 4. Autobiographies and memoirs.
 5. Books or articles written at the time of event?
 6. Government documents.
 7. Census statistics.
 8. Organisational records.
 9. Documentaries.
 10. photographs, art (from the time period).
 11. Maps (from the period).
 12. Patents.
 13. Theses.
 14. Dissertations.
 15. Photographs.
 16. Journal articles.
 17. Newspaper articles.
 18. Survey research research.
 19. Meetings.
 20. Symposia.
 21. Original documents.
 22. Records of organisation.
 23. Internet.
 24. Email.
 25. Communication in listservs.
 26. Interviews.
 27. Video recordings.
 28. Audio recordings.
 29. Websites.
 30. Communication through social media.
 31. Artefacts.
 32. Reports.
 33. Works of art and architecture.
 34. Eyewitness.

- 35. Statistics.
- 36. Oral history.
- 37. Description of travel.
- 38. Cartoon.
- 39. Postcards.
- 40. Posters.
- 41. Internet communications.
- 42. Any above reprinted in the original format and language.

- Is the author use secondary source in presenting some data or facts in his/her newspaper, articles, book, magazine/, journal?
 1. Is the second hand source reliable, fair ethical and trustworthy?
 2. Is the second hand source being sloppy, biased, unethical in their quoting paraphrasing and summarising?
 3. Is the secondary source objectively when they are speaking about certain subject?
 4. Are the secondary source present facts carefully or careless?
 5. Is the secondary source truthfully presents the facts opinions/data?
 6. Is the secondary data was accepted blind faith or skeptically analysed by author?
 7. What secondary source did the author use? This is the list of secondary sources:
 - Encyclopedia
 - Chronologies
 - Biographies
 - Monographs
 - Most journal article
 - Literary criticism
 - Political analysis
 - Review of law and legislations
 - Essay on morals and ethics
 - Analyses of social policy
 - Study and teaching material
 - Literature reviews
 - Research articles
 - Criticism of works of literature, art and music
 - Most published books
 - Abstract of articles
 - Paraphrased quotation
 - Dictionaries
 - Textbooks, Commentaries
 - Magazines and newspaper articles
 - Website
 8. Is the Source Reliable or Unreliable?

- Is the author use tertiary source in presenting some data or facts in her newspaper, articles, book journal or magazine
 1. Is the tertiary hand source reliable, fair, ethical and trustworthy?
 2. Is the tertiary hand source being sloppy, biased, unethical in their quoting, paraphrasing and summarising.
 3. Is the tertiary source objectively when they are speaking about certain subject?
 4. Are the tertiary source present facts carefully or careless?
 5. Is the tertiary source truthfully presents the facts opinions/data?
 6. Is the tertiary data was accepted blind faith or skeptically analysed by author?
 7. What tertiary source did the author use? List:
 - Almanacs
 - Bibliographies
 - Classification
 - Population registers
 - Chronologies
 - Dictionaries
 - Encyclopedias
 - Directories
 - Fact books
 - Guidebooks
 - Indexes
 - Abstract sources
 - Manuals textbooks
 - Handbooks
 - Wikipedia
 - Concordance
 - Field guides
 - Timelines
 - Surveys
 - Overview articles
 - Directories
 8. Is the Source Reliable or Unreliable?

Analysis of Opposing Side Arguments

Rules 30 Review and analyze text in logical way. There are number of things I will look when analyse and review text in Logical way:

- A. Basic Concepts.
- B. Language and definition.
- C. Informal Fallacies.
- D. Categorical Propositions.
- E. Categorical Syllogism.
- F. Propositional Logic.
- G. Natural Deduction in Propositional Logic.
- H. Predicate Logic.
- I. Analogy and Legal and Moral Reasoning.
- J. Causality and Mill's Reasoning.
- K. Probability.
- L. Statistical Reasoning.
- M. Hypothetical Scientific Reasoning.
- N. Science and Superstition.

Logic

1. **Introduction to Logic by Patrick Hurley.**
2. **Handbook of Logic and language by J van Benthem.**
3. **Introduction to logic and critical thinking by Merrilee h Salmon.**
4. **Logically Fallacious By Bo BENNET.**
5. **Modal Logic by Patrick Blackburn.**
6. **Modal Logic by Brian Chellas.**
7. **Symbolic Logic By Tony Roy.**
8. **A System of Logic by John Stuart Mill.**
9. **Argumentation and Debate by austin Freely.**
10. **Critical Thinking, reading and Writing by Sylvan Barnett.**
11. **Critical Thinking- The Art of Argument.**
12. **Critical thinking, Logic & Problem Solving_ The Ultimate Guide to Better Thinking, Systematic Problem Solving and Making Impeccable Decisions with Secret Tips to Detect Logical Fallacies.**
13. **Logic Complete Introduction.**

14. Socratic Logic A Logic Text using Socratic Method, Platonic Questions, and Aristotelian Principles.

15. Complete Works By Aristotle.

Rules 31-Premises, Conclusions, Assumptions, Arguments, Logic

A. Did the author used non arguments:

- Question.
- Command.
- Reports.
- Piece of advise.
- Warnings.
- Statements of belief.
- Statements of opinion.
- Explanation.
- Instructions.
- Expository passages.
- Loosely associated statement.

B. Make a list of arguments used by author, presenter, talker provided.

C. How many arguments have/has the author, presenter, talker provided?

D. What are the assumption of the author on the topic?

E. What are the premises of the author on the topic?

- Is the argument truth or false?

F. What are the premise indicators:

- Since- as indicated by.
- Because- the reason is that.
- For- for the reason that.
- As- may be inferred from.
- Follows from- may be derived from.
- As shown by- may be deduced from.
- Inasmuch as- in view of the facts that.
- On the assumption that.
- If.
- If we assume that.
- If we suppose that\in the view of the fact that.
- As shown by.

- As indicated by.
- The reason is that.
- For the reason that.
- For this reason.

G. What is the conclusion of the author on the topic?

H. What are the conclusion indicator?

- Therefore- for these reasons.
- Hence- it follows that.
- So- I conclude that.
- Accordingly- which shows that.
- In consequence- which means that.
- Consequently- which entails that.
- Proves that- which implies that.
- As a result- which allows us to infer that.
- For this reason- which points to the conclusion that.
- Thus- we may infer.
- It follows.
- Which shows.
- So.
- Then (after if).
- Indicates that.
- Implies that.
- Entails that.
- So you can see that.
- We can conclude that.
- We can infer that.
- We may deduce that.
- Points to the conclusion that.
- Which means that.
- Which shows that.
- Leads one to believe that.
- Bears out the point that.
- Proves that.
- Thus.

- As a result.
- Accordingly.
- For this reason (followed by a comma).

I. What are the arguments of the author on the topic?

- Is the argument valid or invalid.

J. How did the author came up with this conclusion?

K. Use each chapter of the book while finding the arguments

- Basic Concepts.
- Language and definition.
- Informal Fallacies.
- Categorical Propositions.
- Categorical Syllogism.
- Propositional Logic.
- Natural Deduction in Propositional Logic.
- Predicate Logic.
- Analogy and Legal and Moral Reasoning.
- Causality and Mill's Reasoning.
- Probability.
- Statistical Reasoning.
- Hypothetical Scientific Reasoning.
- Science and Superstition.

L. Did the author used:

- Philosophical Logic
- Mathematical Logic
- Computational Logic
- Formal Logic
- Informal Logic
- Inductive
- Deductive
- Propositional logic
- Predicate logic
- Modal logic
- Non classical logic

- Symbolic Logic

- M. Did the Author diagrammed his own argument?
- N. Did the author diagrammed opposite arguments?
- O. Square of the Opposition.
- P. Contradictions.
- Q. Categorical propositions.
- R. Categorical Syllogism.
- S. Hypothetical Syllogism.
- T. Proof of Invalidity.
- U. Analogical Reasoning.
- V. Causal Reasoning.
- W. Cause and Effect.
- X. Use the following:
 - What?
 - Who?
 - Why?
 - When?
 - Where?
 - How?
 - How not?
 - Do?
 - Do not?
 - Did?
 - Did not?
 - Can?
 - Can not?
 - May?
 - May not?
 - Might?
 - Might not?
 - Does?
 - Does not ?

- Y. Did author carefully reviewed the arguments and objections?
- Z. Did author very careful tried how to answer these objections? Did author correctly understood these objections?
- AA. Did author take the best arguments from opposing side on the topic, book, argument, facts from opposite side.
- BB. Does the author, presenter, speaker, writer calling opposing person by name to discredit him/her/ them?

Rules 32 Review and analyze text in logical way. There are number of things I will look when analyse and review text in Logical way:

- A. Basic Concepts.
- B. Language and definition.
- C. Informal Fallacies.
- D. Categorical Propositions.
- E. Categorical Syllogism.
- F. Propositional Logic.
- G. Natural Deduction in Propositional Logic.
- H. Predicate Logic.
- I. Analogy and Legal and Moral Reasoning.
- J. Causality and Mill's Reasoning.
- K. Probability.
- L. Statistical Reasoning.
- M. Hypothetical Scientific Reasoning.
- N. Science and Superstition.

Logic

Analysis of Opposing Side Logical Fallacies

Rules 33-Find the Fallacies if there is any

- A. List of the Logical fallacies used by the author, presenter, speaker, writer?
- B. What classification of fallacies did the author, speaker, presenter, writer used?
- C. What Logical fallacies did the author used?
- D. What are the evidence of the logical fallacies? Show in the book, presentation, articles etc.
- E. Review every single fallacy and review if they committed one of the fallacy.
- F. Be honest if they did and advise, where did they make the fallacy and show evidence where the proof of the fallacy.
- G. What are the reason of the logical fallacies? Show in the book, presentation, articles etc.
- H. Did the author used logical fallacy in any of the presentation, writing, speech, talk, discussion, debate etc..
- I. Give example of similar logical fallacies.
- J. Did the author used logical fallacy in any of the presentation, writing, speech, talk, discussion, debate etc.

Analysis of Opposing Side Facts and Evidence Supporting Argument

Rules 34 What are the Facts supporting Author's arguments

- A. Listen or reading Facts.
- B. What facts the author provided? Make a list.
- C. What author provided? Make a list.

Rules 35 What are the Figures supporting Author's arguments

- A. Listen or reading figures.
- B. What figures does the author provided? Make a list.
- C. What statistics does the author provided? Make a list.
- D. What formulas does the author provided? Make a list.
- E. What mathematical results the author provided? Make a list.
- F. What author provided? Make a list.

Rules 36 What are the evidence supporting Author's arguments

- A. Listen or reading Facts, figures and ideas.
- B. What evidence does the author provided? Make a list.
- C. What author provided? Make a list.

Rules 37 Do the Fact Checking

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
 - Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Research the Facts, figures and ideas and do fact checking, if these are true or false through:
 - Wikipedia
 - E-book
 - Books about autobiography and Biography

C. Do full fact checking of the facts the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

D. Do full fact checking of the figures the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

E. Do full fact checking of the statistics the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

F. Do full fact checking of the formulas the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?

- G. Do full fact checking of the mathematical results the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- H. Do full fact checking of the evidences the author provided.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- I. Any other information author provided do full fact checking.
- Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

Analysis of Opposing Side Bias and Unbiased

Rules 38 Bias vs Unbiased

- A. Listen and read if the author is biased or unbiased.
- B. Is the author best representative for one or another side?
- C. Is the author bias or not? What is the author's bias and purpose?
- D. Does the speaker or writer have personal or professional interest in the information they are presenting?
- E. How a writer might purposely present ideas or events in ways that favour a particular political party/organisation/religion/social group?
- F. Does the author presents facts and explain the ideas to reader or listener?
- G. Is the author uses facts and opinions to argue for or against some idea?
- H. Is the author tries to amuse or interest the reader with humour, suspense, intense and stories?
- I. Look at the language in the passage?
 - If it is neutral and objective, the purpose is probably simply to inform the reader?
 - If is includes terms and are strongly positive, negative or emotional, the purpose is probably to persuade the reader?
 - It is include situations or descriptions that are funny, surprising or intriguing the writer, probably wants to entertain the reader?
- J. Is the author biased?
 - Is the author presenting only one side of an argument?
 - Is it include only facts and examples that support writer's opinion?
 - Is it using the language intended to influence the reader's emotions?
 - Is it ridicules other opinions or views?
- K. Does the author have contradictory information, cherry picked evidence or carefully select language in which to present information favourably?
- L. Is the author or speaker speaks/writes for company, special interest group, an institute foundation think tank or political party?
- M. Does the author/writer gets paid or provided any gift for endorsement or opinion?
- N. Does the person have interest on this topic or has any personal gain? If not then this writer/speaker is disinterested, impartial/unbiased objective.
- O. If the speaker/writer has interest, then why does she/he present the information/ data in such a way?

- P. In surveys or studies has the author worded the question in such a way to ensure the sought-after response?
- Q. Is the company paid the author to prove that the device or product is better than any other product in the market?
- R. Is the marketer or industry trying to defend the product? Did the author put the best spin on its information?
- S. When was the survey or studies or experiment done?
- T. What day were the tests, survey or experiment done?
- U. Purpose of the author writing?
- V. How did the author handle opposing view? Is the author trying to persuade the reader to some belief?
- W. Does the author fairly handle the opposing view? Or did the author dismiss opposing points without regard to their possible value?
- X. Does the writer make any straw man fallacy, misrepresenting opposing view to more easily knock them down?
- Y. Did the author use slanted language or commit personal attack?
- Z. Does the writer use sweeping generalisation or demonstrate an either/or approach to complicated issues, thereby revealing a strong bias toward one side?
- AA. Does the writer pretend to be objective?
- BB. Does the writer intend to be ironic or satirical, if she or he is clearly exaggerating for effect?
- CC. Does the writer admit to guesswork and speculation?

Analysis of Opposing Side Sources They Used

Rules 39 Sources the author used

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Listen or read what sources of information Author used
- C. What are the author's sources?
- Did the writer respond to those who have preceded them?
 - Has the writer depended on the primary/secondary/tertiary sources?
 - Has the writer misquoted the primary/secondary/tertiary or has he quoted the primary/secondary/tertiary source?
 - Has the writer uses statistics or data, has he used primary/secondary/tertiary source?
 - Has the writer interpreted the data or survey or statistics biased/unbiased?
 - Has the author correctly interpreted the information?
 - Has the author incorrectly interpreted information?
 - Search the very sources author uses and see if the author interpreted the information in correct way.
 - Has the author uses trust sources for the work he has written?

D. Checking Each Fact's Sources, If they Are Reliable or Unreliable.

E. Sources

- Is the author uses primary source in presenting some data or facts in his/her newspaper, article, book journal?
 1. Is the primary source reliable, fair, ethical and trustworthy?
 2. Is the primary source sloppy, biased, unethical?
 3. Is the primary source objective when they speaking about certain subject?
 4. Are the primary source present facts carefully or careless?
 5. Is the primary source truthfully presenting the facts, opinions and data?
 6. Who is the writer? Is he /she qualified expert to write about this topic?
 7. Did the write done proper research regarding the topic?
 8. What is the tone?
 9. What is the purpose of publication?
 10. What assumption does the author make?
 11. What are the bases of author's conclusions?
 12. Does the author agree or disagree with other authors on the subject?
 13. Was this written in regards of the counterargument other authors who have opposite views?
 14. Does the content agree or disagree with author/authors on the subject?
 15. Does the content agree or disagree with what you know or have learned about the issue?
 16. Where was the source made?
 17. Where is the material from? Is this a valid source of information?

- What primary sources did the author use. This is the list of primary source:
 1. Data and original research
 2. Diaries and journals
 3. Letters and memos
 4. Autobiographies and memoirs
 5. Books or articles written at the time of event?
 6. Government documents
 7. Census statistics
 8. Organisational records
 9. Documentaries
 10. photographs, art (from the time period)
 11. Maps (from the period)
 12. Patents
 13. Theses
 14. Dissertations
 15. Photographs
 16. Journal articles
 17. Newspaper articles
 18. Survey research research
 19. Meetings
 20. Symposia
 21. Original documents
 22. Records of organisation
 23. Internet
 24. Email
 25. Communication in listservs
 26. Interviews
 27. Video recordings
 28. Audio recordings
 29. Websites
 30. Communication through social media
 31. Artefacts
 32. Reports
 33. Works of art and architecture
 34. Eyewitness

- 35. Statistics
- 36. Oral history
- 37. Description of travel
- 38. Cartoon
- 39. Postcards
- 40. Posters
- 41. Internet communications
- 42. Any above reprinted in the original format and language

- Is the author use secondary source in presenting some data or facts in his/her newspaper, articles, book, magazine/, journal?
 1. Is the second hand source reliable, fair ethical and trustworthy?
 2. Is the second hand source being sloppy, biased, unethical in their quoting paraphrasing and summarising?
 3. Is the secondary source objectively when they are speaking about certain subject?
 4. Are the secondary source present facts carefully or careless?
 5. Is the secondary source truthfully presents the facts opinions/data?
 6. Is the secondary data was accepted blind faith or skeptically analysed by author?
 7. What secondary source did the author use? This is the list of secondary sources:
 - Encyclopedia
 - Chronologies
 - Biographies
 - Monographs
 - Most journal article
 - Literary criticism
 - Political analysis
 - Review of law and legislations
 - Essay on morals and ethics
 - Analyses of social policy
 - Study and teaching material
 - Literature reviews
 - Research articles
 - Criticism of works of literature, art and music
 - Most published books
 - Abstract of articles
 - Paraphrased quotation
 - Dictionaries
 - Textbooks
 - Commentaries
 - Magazines and newspaper articles
 - Website

- Is the author use tertiary source in presenting some data or facts in her newspaper, articles, book journal or magazine
 1. Is the tertiary hand source reliable, fair, ethical and trustworthy?
 2. Is the tertiary hand source being sloppy, biased, unethical in their quoting, paraphrasing and summarising.
 3. Is the tertiary source objectively when they are speaking about certain subject?
 4. Are the tertiary source present facts carefully or careless?
 5. Is the tertiary source truthfully presents the facts opinions/data?
 6. Is the tertiary data was accepted blind faith or skeptically analysed by author?
 7. What tertiary source did the author use? List:
 - Almanacs
 - Bibliographies
 - Classification
 - Population registers
 - Chronologies
 - Dictionaries
 - Encyclopedias
 - Directories

Analysis of Analysis of the Author, Writer, Presenter of opposing Arguments.

Rules 40 Analyse of the analysis of the author, writer, presenter.

- A. Has the author carefully reviewed the opposing arguments in comparison to their own?
- B. Did author take the best arguments from opposing side on the topic, book, argument, facts from opposite side.
- C. Did author PROVIDE THE BEST arguments against the opposing side and provide: best analysis, did not make any fallacies, honest and in the context analysis, provide correct facts, statistics.
- D. Find out what ideologies behind these arguments?
- E. Did the author correctly understood these objections?
- F. Has the author carefully thought out the answer to the objections?
- G. Did the author presenter, speaker, critic used tricks to get an attention from the audience? What was this/these tricks?
- H. Did the author used logical fallacies in any of the analysis of the opposing side in their presentation. Writing, speech, talk, debate.
- I. What logical fallacies did the author used in analysis.
- J. Did the author tried the best to criticise fairly the arguments, conclusion, topic, books, or articles?
- K. Did the Author used incorrect facts, statistics, information in presentation, writing, speech, talk, discussion, debate etc
- L. Where did the author used incorrect information, statistics, facts or made logical fallacy in presentation, writing, speech, talk, discussion, debate etc.
- M. What other sources did the author used in order to answer the objections to opposing side arguments.
- N. Did the author tired to provoke some sort of emotions, feelings?
- O. Does the author, presenter, speaker, writer calling opposing person by name to discredit him, her, them?
- P. Why do they want to discredit?
- Q. Did the author used all AVAILABLE SOURCES, INFORMATION, FACTS AND ARGUMENTS TO HIM/HER.
- R. Does the author trying to rewrite facts, information, history of the subject to fit his/ her arguments and situation?

- S. Did the author do honest analysis of all available sources, information, arguments, evidence and facts?
- T. Did the author Use socratic method and questions and tactics in their approach?
- U. Did author represent other side honestly.
- V. Did author represent other side argument in full and without any omit information?

Finding the Solutions

These three rules of analytical reading—about terms, propositions, and arguments —can be brought to a head in an eighth rule, which governs the last step in the interpretation of a book's content. More than that, it ties together the first stage of analytical reading (outlining the structure) and the second stage (interpreting the contents).

Rule 41. Determine which of his problems the author has solved, and which he has not; and as to the latter, decide which the author knew he had failed to solve. The last step in your attempt to discover what a book is about was the discovery of the major problems that the author tried to solve in the course of his book. (As you will recall, this was covered by Rule 4.) Now, after you have come to terms with him and grasped his propositions and arguments, you should check what you have found by addressing yourself to some further questions. Which of the problems that the author tried to solve did he succeed in solving? In the course of solving these, did he raise any new ones? Of the problems that he failed to solve, old or new, which did the author himself know he had failed on? A good writer, like a good reader, should know whether a problem has been solved or not, although of course it is likely to cost the reader less pain to acknowledge the situation.

This final step in interpretive reading is covered by RULE 42. FIND OUT WHAT THE AUTHOR'S SOLUTIONS ARE. When you have applied this rule, and the three that precede it in interpretive reading, you can feel reasonably sure that you have managed to understand the book. If you started with a book that was over your head—one, therefore, that was able to teach you something—you have come a long way. More than that, you are now able to complete your analytical reading of the book. The third and last stage of the job will be relatively easy. You have been keeping your eyes and your mind open and your mouth shut. Up to this point, you have been following the author. From this point on, you are going to have a chance to argue with the author and express yourself.

The Second Stage of Analytical Reading

We have now described the second stage of analytical reading. Another way to say this is that we have now set forth the materials for answering the second basic question that you must ask about a book, or indeed anything that you read. You will recall that that second question is *What is being said in detail, and how?* Applying Rules 5 through 8 clearly helps you to answer this question. When you have come to terms with the author, found his key propositions and arguments, and identified his solutions of the problems that he faced, you will know what he is saying in his book, and you are thus prepared to go on to ask the final two basic questions about it.

Since we have now completed another stage in the analytical reading process, let us, as before, pause a moment to write out the rules of this stage for review.

THE SECOND STAGE OF ANALYTICAL READING, OR RULES FOR FINDING WHAT A BOOK SAYS (INTERPRETING ITS CONTENTS)

- 5. Come to terms with the author by interpreting his key words.**
- 6. Grasp the author's leading propositions by dealing with his most important sentences.**
- 7. Know the author's arguments, by finding them in, or constructing them out of, sequences of sentences.**
- 8. Determine which of his problems the author has solved, and which he has not; and as to the latter, decide which the author knew he had failed to solve.**

Criticising a Book Fairly

We said at the end of the last chapter that we had come a long way. We have learned how to outline a book. We have learned the four rules for interpreting a book's contents. We are now ready for the last stage of analytical reading. Here you will reap the reward of all your previous efforts.

Reading a book is a kind of conversation. You may think it is not conversation at all, because the author does all the talking and you have nothing to say. If you think that, you do not realise your full obligation as a reader—and you are not grasping your opportunities.

As a matter of fact, the reader is the one who has the last word. The author has had his say, and then it is the reader's turn. The conversation between a book and its reader would appear to be an orderly one, each party talking in turn, no interruptions, and so forth. If, however, the reader is undisciplined and impolite, it may be anything but orderly. The poor author cannot defend himself. He cannot say, "Here, wait till I've finished, before you start disagreeing." He cannot protest that the reader has misunderstood him, has missed his point.

Ordinary conversations between persons who confront each other are good only when they are carried on civilly. We are not thinking merely of the civilities according to conventions of social politeness. Such conventions are not really important. What is important is that there is an *intellectual* etiquette to be observed. Without it, conversation is bickering rather than profitable communication. We are assuming here, of course, that the conversation is about a serious matter on which men can agree or disagree. Then it becomes important that they conduct themselves well. Otherwise, there is no profit in the enterprise. The profit in good conversation is something learned.

What is true of ordinary conversation is even more true of the rather special situation in which a book has talked to a reader and the reader talks back. That the author is well disciplined, we will take for granted temporarily. That he has conducted his part of the conversation well can be assumed in the case of good books. What *can* the reader do to reciprocate? What *must* he do to hold up his end well?

The reader has an obligation as well as an opportunity to talk back. The opportunity is clear. Nothing can stop a reader from pronouncing judgment. The roots of the obligation, however, lie a little deeper in the nature of the relation between books and readers.

If the book is of the sort that conveys knowledge, the author's aim was to instruct. He has tried to teach. He has tried to convince or persuade his reader about something. His effort is crowned with success only if the reader finally says, "I am taught. You have convinced me that such and such is true, or persuaded me that it is probable." But even if the reader is not convinced or persuaded, the

author's intention and effort should be respected. The reader owes him a considered judgment. If he cannot say, "I agree," he should at least have grounds for disagreeing or even for suspending judgment on the question.

We are really saying no more than what we have already said many times. A good book deserves an active reading. The activity of reading does not stop with the work of understanding what a book says. *It must be completed by the work of criticism, the work of judging.* The undemanding reader fails to satisfy this requirement, probably even more than he fails to analyze and interpret. He not only makes no effort to understand; he also dismisses a book simply by putting it aside and forgetting it. Worse than faintly praising it, he damns it by giving it no critical consideration whatever.

Teachability as a Virtue

What we mean by talking back is not something apart from reading. It is the third stage in the analytical reading of a book; and there are rules here as in the case of the first two stages. Some of these rules are general maxims of intellectual etiquette. We will deal with them in this chapter. Others are more specific criteria for defining points of criticism. They will be discussed in the next chapter.

There is a tendency to think that a good book is above the criticism of the average reader. The reader and the author are not peers. The author, according to this view, should be subjected to a trial only by a jury of his peers. Remember Bacon's recommendation to the reader: "Read not to contradict and confute; nor to believe and take for granted; nor to find talk and discourse; but to weigh and consider." Sir Walter Scott casts even more dire aspersions on those "who read to doubt or read to scorn."

There is a certain truth here, of course, but there is also a good deal of nonsense about the aura of impeccability with which books are thus surrounded, and the false piety it produces. Readers may be like children, in the sense that great authors can teach them, but that does not mean they must not be heard from. Cervantes may or not have been right in saying, "There is no book so bad but something good may be found in it." It is more certain that there is no book so good that no fault can be found with it.

It is true that a book that can enlighten its readers, and is in this sense superior to them, should not be criticised by them until they understand it. When they do, they have elevated themselves almost to equality with the author. Now they are fit to exercise the rights and privileges of their new position. Unless they exercise their critical faculties now, they are doing the author an injustice. He has done what he could to make them his equal. He deserves that they act like his peers, that they engage in conversation with him, that they talk back.

We are discussing here the virtue of teachability—a virtue that is almost always misunderstood. Teachability is often confused with subservience. A person is wrongly thought to be teachable if he is passive and pliable. On the contrary, teachability is an extremely active virtue. No one is really teachable who does not freely exercise his power

of independent judgment. He can be trained, perhaps, but not taught. *The most teachable reader is, therefore, the most critical.* He is the reader who finally responds to a book by the greatest effort to make up his own mind on the matters the author has discussed.

We say “finally” because teachability requires that a teacher be fully heard and, more than that, understood before he is judged. We should add also that sheer amount of effort is not an adequate criterion of teachability. The reader must know *how* to judge a book, just as he must know how to arrive at an understanding of its contents. This third group of rules for reading, then, is a guide to the last stage in the disciplined exercise of teachability.

The Role of Rhetoric

We have everywhere found a certain reciprocity between the art of teaching and the art of being taught, between the skill of the author that makes him a considerate writer and the skill of the reader that makes him handle a book with consideration. We have seen how the same principles of grammar and logic underlie rules of good writing as well as rules of good reading. The rules we have so far discussed concern the achievement of intelligibility on the part of the writer and the achievement of understanding on the part of the reader. This last set of rules goes beyond understanding to critical judgment. Here is where rhetoric comes in.

There are, of course, many uses of rhetoric. We usually think of it in connection with the orator or the propagandist. But in its most general significance, rhetoric is involved in every situation in which communication takes place among human beings. If we are the talkers, we wish not only to be understood but also to be agreed with in some sense. If our purpose in trying to communicate is serious, we wish to convince or persuade—more precisely, to convince about theoretical matters and to persuade about matters that ultimately affect action or feeling.

To be equally serious in receiving such communication, one must be not only a *responsive* but also a *responsible* listener. You are responsive to the extent that you follow what has been said and note the intention that prompts it. But you also have the responsibility of taking a position. When you take it, it is yours, not the author's. To regard anyone except yourself as responsible for your judgment is to be a slave, not a free man. It is from this fact that the liberal arts acquire their name.

On the part of the speaker or writer, rhetorical skill is knowing how to convince or persuade. Since this is the ultimate end in view, all the other aspects of communication must serve it. Grammatical and logical skill in writing clearly and intelligibly has merit in itself, but it is also a means to an end. Reciprocally, on the part of the reader or listener, rhetorical skill is knowing how to react to anyone who tries to convince or persuade us. Here, too, grammatical and logical skill, which enables us to understand what is being said, prepares the way for a critical reaction.

RULE 43. Rhetorical Analysis Of The Text.

A. Open Rhetorical Analysis Folder. Use The Following Books For Rhetorical Analysis of The Book:

- Rhetoric By Aristotle.
- A Companion to Rhetoric and Rhetorical Criticism.
- Ancient Rhetoric From Aristotle to Philostratus.
- Ancient Rhetoric For Contemporary Students by Sharon Crowley.
- Art Of Rhetoric By Aristotle.
- Conversations In American Literature: Language, Rhetoric, Culture By Robin Aufses.
- Encyclopaedia of Rhetoric.
- On Rhetoric: Theory of Civic Discourse by Aristotle.
- Politics and Rhetoric: The Persuasive Power of Metaphor.
- Rhetoric By Jennifer Richards.
- Rhetoric In Details By John Benjamins.
- Rhetorical Grammar By Martha Kolln.
- Sourcebook on Rhetoric By James Jasinski.
- The Language of Composition: Reading, Writing, Rhetoric by Renee Shea.
- The Longman Writer_ Rhetoric, Reader, Research Guide, and Handbook.
- The Rhetoric of Reason By James Crosswhite.
- Trivium- Liberal Arts of Logic, Grammar and Rhetoric By Sister Mirriam Joseph.
- Writing Arguments: a RHETORIC With Reading by John Ramage.

B. Follow Every step of the Book, I have chose to do Rhetorical Analysis.

The Importance of Suspending Judgment

Thus you see how the three arts of grammar, logic, and rhetoric cooperate in regulating the elaborate processes of writing and reading. Skill in the first two stages of analytical reading comes from a mastery of grammar and logic. Skill in the third stage depends on the remaining art. The rules of this stage of reading rest on the principles of rhetoric, conceived in the broadest sense. We will consider them as a code of etiquette to make the reader not only polite, but also effective, in talking back. (Although it is not generally recognized, etiquette always serves these two purposes, not just the former.)

You probably also see what the ninth rule of reading is going to be. It has been intimated several times already. Do not begin to talk back until you have listened carefully and are sure you understand. Not until you are honestly satisfied that you have accomplished the first two stages of reading should you feel free to express yourself. When you have, you not only have earned the right to turn critic, you also have the duty to do so.

This means, in effect, that the third stage of analytical reading must always follow the other two in time. The first two stages interpenetrate each other. Even the beginning reader can combine them somewhat, and the expert combines them almost completely. He can discover the contents of a book by breaking down the whole into its parts and at the same time constructing the whole out of its elements of thought and knowledge, its terms, propositions, and arguments. Furthermore, even for the beginner, a certain amount of the work required at those two stages can be performed during a good inspectional reading. But the expert no less than the beginner must wait until he understands before he starts to criticize.

Let us restate this ninth rule of reading in the following form: RULE 44. YOU MUST BE ABLE TO SAY, WITH REASONABLE CERTAINTY, "I UNDERSTAND," BEFORE YOU CAN SAY ANY ONE OF THE FOLLOWING THINGS: "I AGREE," OR "I DISAGREE," OR "I SUSPEND JUDGMENT." These three remarks exhaust all the critical positions you can take. We hope you have not made the error of supposing that to criticise is always to disagree. That is a popular misconception. To agree is just as much an exercise of critical judgment on your part as to disagree. You can be just as wrong in agreeing as in disagreeing. To agree without understanding is inane. To disagree without understanding is impudent.

Though it may not be so obvious at first, suspending judgment is also an act of criticism. It is taking the position that something has not been shown. You are saying that you are not convinced or persuaded one way or the other.

The rule seems to be such obvious common sense that you may wonder why we have bothered to state it so explicitly. There are two reasons. In the first place, many people make the error already mentioned of identifying criticism with disagreement. (Even “constructive” criticism is disagreement.) In the second place, though this rule seems obviously sound, our experience has been that few people observe it in practice. Like the golden rule, it elicits more lip service than intelligent obedience.

Every author has had the experience of suffering book reviews by critics who did not feel obliged to do the work of the first two stages first. The critic too often thinks he does not have to be a reader as well as a judge. Every lecturer has also had the experience of having critical questions asked that were not based on any understanding of what he had said. You yourself may remember an occasion where someone said to a speaker, in one breath or at most two, “I don’t know what you mean, but I think you’re wrong.”

There is actually no point in answering critics of this sort. The only polite thing to do is to ask them to state your position for you, the position they claim to be challenging. If they cannot do it satisfactorily, if they cannot repeat what you have said *in their own words*, you know that they do not understand, and you are entirely justified in ignoring their criticisms. They are irrelevant, as all criticism must be that is not based on understanding. When you find the rare person who shows that he understands what you are saying as well as you do, then you can delight in his agreement or be seriously disturbed by his dissent.

In years of reading books with students of one kind and another, we have found this rule more honoured in the breach than in the observance. Students who plainly do not know what the author is saying seem to have no hesitation in setting themselves up as his judges. They not only disagree with something they do not understand but, what is equally bad, they also often agree to a position they cannot express intelligibly in their own words. Their discussion, like their reading, is all words. Where understanding is not present, affirmations and denials are equally meaningless and unintelligible. Nor is a position of doubt or detachment any more intelligent in a reader who does not know what he is suspending judgment about.

There are several further points to note concerning the observance of this rule. If you are reading a good book, you ought to hesitate before you say, “I understand.” The presumption certainly is that you have a lot of work to do before you can make that declaration honestly and with assurance. You must, of course, be a judge of yourself in this matter, and that makes the responsibility even more severe.

To say “I don’t understand” is, of course, also a critical judgment, but *only after you have tried your hardest does it reflect on the book rather than yourself*. If you have done everything that can be expected of you and still do not understand, it may be because the book is unintelligible. The presumption, however, is in favor of the book, especially if it is a good one. In reading good books, failure to understand

is usually the reader's fault. Hence he is obligated to stay with the task imposed by the first two stages of analytical reading a long time before entering on the third. When you say "I don't understand," watch your tone of voice. Be sure it concedes the possibility that it may not be the author's fault.

There are two other conditions under which the rule requires special care. If you are reading only part of a book, it is more difficult to be sure that you understand, and hence you should be more hesitant to criticise. And sometimes a book is related to other books by the same author, and depends upon them for its full significance. In this situation, also, you should be more circumspect about saying "I understand," and slower to raise your critical lance.

A good example of brashness in this last respect is furnished by literary critics who have agreed or disagreed with Aristotle's *Poetics* without realising that the main principles in Aristotle's analysis of poetry depend in part on points made in other of his works, his treatises on psychology and logic and metaphysics. They have agreed or disagreed without understanding what it is all about.

The same is true of other writers, such as Plato and Kant, Adam Smith and Karl Marx, who have not been able to say everything they knew or thought in a single work. Those who judge Kant's *Critique of Pure Reason* without reading his *Critique of Practical Reason*, or Adam Smith's *Wealth of Nations* without reading his *Theory of the Moral Sentiments*, or *The Communist Manifesto* without Marx's *Capital*, are more likely than not to be agreeing or disagreeing with something they do not fully understand.

The first thing a reader can say is that he understands or that he does not. In fact, he must say he understands, in order to say more. ***If he does not understand The Book, Article, Discussion, Debate or any other resource he should keep his peace and go back to work on the book, Article, Discussion, Debate or any other resource.***

The Importance of Avoiding Contentiousness

The second general maxim of critical reading is as obvious as the first, but it needs explicit statement, nevertheless, and for the same reason. It is **RULE 45**, and it can be expressed thus: **WHEN YOU DISAGREE, DO SO REASONABLY, AND NOT DISPUTATIIOUSLY OR CONTENTIOUSLY**. There is no point in winning an argument if you know or suspect you are wrong. Practically, of course, it may get you ahead in the world for a short time. But honesty is the better policy in the slightly longer run.

We learned this maxim first from Plato and Aristotle. In a passage in the *Symposium*, this interchange occurs:

I cannot refute you, Socrates, said Agathon: Let us assume that what you say is true.

Say rather, Agathon, that you cannot refute the truth; for Socrates is easily refuted.

The passage is echoed in a remark of Aristotle's in the *Ethics*. "It would be thought to be better," he says, indeed to be our duty, for the sake of maintaining the truth even to destroy what touches us closely, especially as we are philosophers or lovers of wisdom; for, while both are dear, piety requires us to honor truth above our friends.

Plato and Aristotle here give us advice that most people ignore. Most people think that winning the argument is what matters, not learning the truth.

He who regards conversation as a battle can win only by being an antagonist, only by disagreeing successfully, whether he is right or wrong. The reader who approaches a book in this spirit reads it only to find something he can disagree with. For the disputatious and the contentious, a bone can always be found to pick a quarrel over. It makes no difference whether the bone is really a chip on your own shoulder.

In a conversation that a reader has with a book in the privacy of his own study, there is nothing to prevent the reader from seeming to win the argument. He can dominate the situation. The author is not there to defend himself. If all he wants is the empty satisfaction of seeming to show the author up, the reader can get it readily. He scarcely has to read the book through to get it. Glancing at the first few pages will suffice.

But if he realizes that the only profit in conversation, with living or dead teachers, is what one can learn from them, if he realizes that you win only by gaining knowledge, not by knocking the other fellow down, he may see the futility of mere contentiousness. We are not saying that a reader should not ultimately disagree and try to show where the author is wrong. We are saying only that *he should be as prepared to agree as to disagree*. Whichever he does should be motivated by one consideration alone—the facts, the truth about the case. More than honesty is required here. It goes without saying that a reader should admit a point when he sees it. But he also should not feel *whipped* by having to agree with an author, instead of dissenting. If he feels that way, he is inveterately

disputatious. In the light of this second maxim, his problem is seen to be emotional rather than intellectual.

On the Resolution of Disagreements

The third maxim is closely related to the second. It states another condition prior to the undertaking of criticism. It recommends that you regard disagreements as capable of being resolved. Where the second maxim urged you not to disagree *disputatiously*, this one warns you against disagreeing *hopelessly*. One is hopeless about the fruitfulness of discussion if he does not recognize that all rational men can agree. Note that we said “can agree.” We did not say all rational men *do* agree. Even when they do not agree, they can. The point we are trying to make is that disagreement is futile agitation unless it is undertaken with the hope that it may lead to the resolution of an issue.

These two facts, that people do disagree and can agree, arise from the complexity of human nature. Men are rational animals. Their rationality is the source of their power to agree. Their animality, and the imperfections of their reason that it entails, is the cause of most of the disagreements that occur. Men are creatures of passion and prejudice. The language they must use to communicate is an imperfect medium, clouded by emotion and colored by interest, as well as inadequately transparent for thought. Yet to the extent that men are rational, these obstacles to their understanding can be overcome. The sort of disagreement that is only apparent, the sort that results from misunderstanding, is certainly curable.

There is, of course, another sort of disagreement, which is owing merely to inequalities of knowledge. The relatively ignorant often wrongly disagree with the relatively learned about matters exceeding their knowledge. The more learned, however, have a right to be critical of errors made by those who lack relevant knowledge. Disagreement of this sort can also be corrected. Inequality of knowledge is always curable by instruction.

There may still be other disagreements that are more deeply buried, and that may subsist in the body of reason itself. It is hard to be sure about these, and almost impossible for reason to describe them. In any event, what we have just said applies to the great majority of disagreements. They can be resolved by the removal of misunderstanding or of ignorance. Both cures are usually possible, though often difficult. Hence the person who, at any stage of a conversation, disagrees, should at least hope to reach agreement in the end. He should be as much prepared to have his own mind changed as seek to change the mind of another. He should always keep before him the possibility that he misunderstands or that he is ignorant on some point. No one who looks upon disagreement as an occasion for teaching another should forget that it is also an occasion for being taught.

The trouble is that many people regard disagreement as unrelated to either teaching or being taught. They think that everything is just a matter of opinion. I have mine, and you have yours; and our right to our opinions is as inviolable as our right to private property. On such a view, communication cannot be profitable if the profit to be gained is an increase in knowledge. Conversation is hardly better than a ping-pong game of opposed opinions, a game in which no one keeps score, no one wins, and everyone is satisfied because he does not lose—that is, he ends up holding the same opinions he started with.

We would not—and could not—write this book if we held this view. Instead, we hold that knowledge can be communicated and that discussion can result in learning. If genuine knowledge, not mere personal opinion, is at stake, then, for the most part, either disagreements are apparent only—to be removed by coming to terms and a meeting of minds; or they are real, and the genuine issues can be resolved—in the long run, of course—by appeals to fact and reason. The maxim of rationality concerning disagreements is to be patient for the long run. We are saying, in short, that disagreements are arguable matters. And argument is empty unless it is undertaken on the supposition that there is attainable an understanding that, when attained by reason in the light of all the relevant evidence, resolves the original issues.

How does this third maxim apply to the conversation between reader and writer? How can it be stated as a rule of reading? It deals with the situation in which the reader finds himself disagreeing with something in the book. It requires him first to be sure that the disagreement is not owing to misunderstanding. Suppose that the reader has been careful to observe the rule that he must not render a critical judgment until he understands, and is therefore satisfied that there is no misunderstanding here. What then?

This maxim then requires him to distinguish between genuine knowledge and mere opinion, and to regard an issue where knowledge is concerned as one that can be resolved. If he pursues the matter further, he may be instructed by the author on points that will change his mind. If that does not happen, he may be justified in his criticism, and, metaphorically at least, be able to instruct the author. He can at least hope that were the author alive and present, his mind could be changed.

You may remember something that was said on this subject in the last chapter. If an author does not give reasons for his propositions, they can be treated only as expressions of personal opinions on his part. The reader who does not distinguish between the reasoned statement of knowledge and the flat expression of opinion is not reading to learn. He is at most interested in the author's personality and is using the book as a case history. Such a reader will, of course, neither agree nor disagree. He does not judge the book but the man.

If, however, the reader is primarily interested in the book and not the man, he should take his critical obligations seriously. These involve applying the distinction between real knowledge and mere opinion to himself as well as to the author. Thus the reader must do

more than make judgments of agreement or disagreement. He must give reasons for them. In the former case, of course, it suffices if he actively shares the author's reasons for the point on which they agree. But when he disagrees, he must give his own grounds for doing so. Otherwise, he is treating a matter of knowledge as if it were opinion.

RULE 46, therefore, can be stated as follows: RESPECT THE DIFFERENCE BETWEEN KNOWLEDGE AND MERE PERSONAL OPINION BY GIVING REASONS FOR ANY CRITICAL JUDGMENT YOU MAKE.

Incidentally, we would not want to be understood as claiming that there is a great deal of "absolute" knowledge available to men. Self-evident propositions, in the sense in which we defined them in the previous chapter, seem to us to be both indemonstrable and undeniable truths. Most knowledge, however, lacks that degree of absoluteness. What we know, we know subject to correction; we know it because all, or at least the weight, of the evidence supports it, but we are not and cannot be certain that new evidence will not sometime invalidate what we now believe is true.

This, however, does not remove the important distinction between knowledge and opinion that we have been stressing. Knowledge, if you please, consists in those *opinions that can be defended*, opinions for which there is evidence of one kind or another. If we really know something, in this sense, we must believe that we can convince others of what we know. Opinion, in the sense in which we have been employing the word, is unsupported judgment. That is why we have employed the modifiers "mere" or "personal" in conjunction with it. We can do no more than opine that something is true when we have no evidence or reason for the statement other than our personal feeling or prejudice. We can say that it is true and that we know it when we have objective evidence that other reasonable men are likely to accept.

Let us now summarize the three general maxims we have discussed in this chapter. The three together state the conditions of a critical reading and the manner in which the reader should proceed to "talk back" to the author.

The first requires the reader to complete the task of understanding before rushing in. The second adjures him not to be disputatious or contentious. The third asks him to view disagreement about matters of knowledge as being generally remediable. This rule goes further: It also commands him to give reasons for his disagreements so that issues are not merely stated but also defined. In that lies all hope for resolution.

Agreeing or Disagreeing with an Author

The first thing a reader can say is that he understands or that he does not. In fact, he must say he understands, in order to say more. If he does not understand, he should keep his peace and go back to work on the book.

There is one exception to the harshness of the second alternative. “I don’t understand” may itself be a critical remark. To make it so, the reader must be able to support it. If the fault is with the book rather than himself, the reader must locate the sources of trouble. He should be able to show that the structure of the book is disorderly, that its parts do not hang together, that some of it lacks relevance, or, perhaps, that the author equivocates in the use of important words, with a whole train of consequent confusions. To the extent that a reader can support his charge that the book is unintelligible, he has no further critical obligations.

Let us suppose, however, that you are reading a good book. That means it is a relatively intelligible one. And let us suppose that you are finally able to say “I understand.” If, in addition to understanding the book, you agree thoroughly with what the author says, the work is over. The analytical reading is completely done. You have been enlightened, and convinced or persuaded. It is clear that we have additional steps to consider only in the case of disagreement or suspended judgment. The former is the more usual case.

To the extent that authors argue with their readers—and expect their readers to argue back—the good reader must be acquainted with the principles of argument. He must be able to carry on civil, as well as intelligent, controversy. That is why there is need for a chapter of this sort in a book on reading. *Not simply by following an author’s arguments, but only by meeting them as well, can the reader ultimately reach significant agreement or disagreement with his author.*

The meaning of agreement and disagreement deserves a moment’s further consideration. The reader who comes to terms with an author and grasps his propositions and reasoning shares the author’s mind. In fact, the whole process of interpretation is directed toward a meeting of minds through the medium of language. Understanding a book can be described as a kind of agreement between writer and reader. They agree about the use of language to express ideas. Because of that agreement, the reader is able to see through the author’s language to the ideas he is trying to express.

If the reader understands a book, how can he disagree with it? Critical reading demands that he make up his own mind. But his mind and the author’s have become as one through his success in understanding the book. What mind has he left to make up independently? There are some people who make the error that causes this apparent difficulty: they fail to distinguish between two senses of “agreement.” In consequence, they wrongly suppose that where there is

understanding between men, disagreement is impossible. They say that all disagreement is simply owing to misunderstanding.

The error in this becomes obvious as soon as we remember that the author is making judgments about the world in which we live. He claims to be giving us theoretical knowledge about the way things exist and behave, or practical knowledge about what should be done. Obviously, he can be either right or wrong. His claim is justified only to the extent that he speaks truly, to the extent that he says what is probable in the light of evidence. Otherwise, his claim is unfounded.

If you say, for instance, that “all men are equal,” we may take you to mean that all men are equally endowed at birth with intelligence, strength, and other abilities. In the light of the facts as we know them, we disagree with you. We think you are wrong. But suppose we have misunderstood you. Suppose you meant by these words that *all men should have equal political rights*. Because we misapprehended your meaning, our disagreement was irrelevant. Now suppose the mistake corrected. Two alternatives still remain. We can agree or disagree, *but now if we disagree, there is a real issue between us*. We understand your political position, but hold a contrary one.

Issues about matters of fact or policy—issues about the way things are or should be—are real in this sense only when they are based on a common understanding of what is being said. Agreement about the use of words is the indispensable condition for genuine agreement or disagreement about the facts being discussed. It is because of, not in spite of, your meeting the author’s mind through a sound interpretation of his book that you are able to make up your own mind as concurring in or dissenting from the position he has taken.

Prejudice and Judgment

Now let us consider the situation in which, having said you understand, you proceed to disagree. If you have tried to abide by the maxims stated in the previous chapter, you disagree because you think the author can be shown to be wrong on some point. You are not simply voicing your prejudice or expressing your emotions. Because this is true, then, from an ideal point of view, there are three conditions that must be satisfied if controversy is to be well conducted.

The first is this. Since men are animals as well as rational, it is necessary to acknowledge the emotions you bring to a dispute, or those that arise in the course of it. Otherwise you are likely to be giving vent to feelings, not stating reasons. You may even think you have reasons, when all you have are strong feelings.

Second, you must make your own assumptions explicit. You must know what your prejudices—that is, your prejudgments—are. Otherwise you are not likely to admit that your opponent may be equally entitled to different assumptions. ***Good***

controversy should not be a quarrel about assumptions. If an author, for example, explicitly asks you to take something for granted, the fact that the opposite can also be taken for granted should not prevent you from honoring his request. If your prejudices lie on the opposite side, and if you do not acknowledge them to be prejudices, you cannot give the author's case a fair hearing.

Third and finally, an attempt at impartiality is a good antidote for the blindness that is almost inevitable in partisanship. Controversy without partisanship is, of course, impossible. But to be sure that there is more light in it, and less heat, each of the disputants should at least try to take the other fellow's point of view. If you have not been able to read a book *sympathetically*, your disagreement with it is probably more contentious than civil.

These three conditions are, ideally, the *sine qua non* of intelligent and profitable conversation. They are obviously applicable to reading, insofar as that is a kind of conversation between reader and author. Each of them contains sound advice for readers who are willing to respect the civilities of disagreement.

But the ideal here, as elsewhere, can only be approximated. The ideal should never be expected from human beings. We ourselves, we hasten to admit, are sufficiently conscious of our own defects. We have violated our own rules about good intellectual manners in controversy. We have caught ourselves attacking a book rather than criticizing it, knocking straw men over, denouncing where we could not support denials, proclaiming our prejudices as if ours were any better than the author's.

We continue to believe, however, that conversation and critical reading *can* be well disciplined. We are therefore going to substitute for those three ideal conditions, a set of prescriptions that may be easier to follow. They indicate the four ways in which a book can be adversely criticized. Our hope is that if a reader confines himself to making these points, he will be less likely to indulge in expressions of emotion or prejudice.

The four points can be briefly summarized by conceiving the reader as conversing with the author, as talking back. After he has said, "I understand but I disagree," he can make the following remarks to the author: (1) "*You are uninformed*"; (2) "*You are misinformed*"; (3) "*You are illogical—your reasoning is not cogent*"; (4) "*Your analysis is incomplete.*"

These may not be exhaustive, though we think they are. In any event, they are certainly the principal points a reader who disagrees can make. They are somewhat independent. Making one of these remarks does not prevent you from making another. Each and all can be made, because the defects they refer to are not mutually exclusive. But, we should add, the reader cannot make any of these remarks without being definite and precise about the respect in which the author is uninformed or misinformed or illogical. A book cannot be uninformed or

misinformed about everything. It cannot be totally illogical. Furthermore, the reader who makes any of these remarks must not only make it definitely, by specifying the respect, but he must also support his point. He must give reasons for saying what he does.

Judging the Author's Soundness

The first three remarks are somewhat different from the fourth, as we will presently see. Let us consider each of them briefly, and then turn to the fourth.

- 1. To say that an author is *uninformed* is to say that he lacks some piece of knowledge that is relevant to the problem he is trying to solve. Notice here that unless the knowledge, if possessed by the author, would have been relevant, there is no point in making this remark. To support the remark, you must be able yourself to state the knowledge that the author lacks and show how it is relevant, how it makes a difference to his conclusions. A few illustrations here must suffice. Darwin lacked the knowledge of genetics that the work of Mendel and later experimentalists now provides. His ignorance of the mechanism of inheritance is one of the major defects in *The Origin of Species*. Gibbon lacked certain facts that later historical research has shown to have a bearing on the fall of Rome. Usually, in science and history, the lack of information is discovered by later researches. Improved techniques of observation and prolonged investigation make this the way things happen for the most part. But in philosophy, it may happen otherwise. There is just as likely to be loss as gain with the passage of time. The ancients, for example, clearly distinguished between what men can sense and imagine and what they can understand. Yet, in the eighteenth century, David Hume revealed his ignorance of this distinction between images and ideas, even though it had been so well established by the work of earlier philosophers.**
- 2. To say that an author is *misinformed* is to say that he asserts what is not the case. His error here may be owing to lack of knowledge, but the error is more than that. Whatever its cause, it consists in making assertions contrary to fact. The author is proposing as true or more probable what is in fact false or less probable. He is claiming to have knowledge he does not possess. This kind of defect should be pointed out, of course, only if it is relevant to the author's conclusions. And to support the remark you must be able to argue the truth or greater probability of a position contrary to the author's. For example, in one of his political treatises, Spinoza appears to say that democracy is a more primitive type of government than monarchy. This is contrary to well-ascertained facts of political history. Spinoza's error in this respect has a bearing on his argument. Aristotle was misinformed about the role that the female factor plays in animal reproduction, and consequently came to unsupportable conclusions about the processes of procreation.**

Aquinas erroneously supposed that the matter of the heavenly bodies is essentially different from that of terrestrial bodies, because he supposed that the former change only in position, and are otherwise unalterable. Modern astrophysics corrects this error and thereby improves on ancient and medieval astronomy. But here is an error that has limited relevance. Making it does not affect Aquinas' metaphysical account of the nature of all sensible things as composed of matter and form. These first two points of criticism may be related. Lack of information, as we have seen, may be the cause of erroneous assertions. Further, whenever a man is *misinformed* in a certain respect, he is also *uninformed* in the same respect. But it makes a difference whether the defect is simply negative or positive as well. Lack of relevant knowledge makes it impossible to solve certain problems or support certain conclusions. Erroneous suppositions, however, lead to wrong conclusions and untenable solutions. Taken together, these two points charge an author with defects in his premises. He needs more knowledge than he possesses. His evidences and reasons are not good enough in quantity or quality.

3. To say that an author is *illogical* is to say that he has committed a fallacy in reasoning. In general, fallacies are of two sorts. There is the *non sequitur*, which means that what is drawn as a conclusion simply does not follow from the reasons offered. And there is the occurrence of inconsistency, which means that two things the author has tried to say are incompatible. To make either of these criticisms, the reader must be able to show the precise respect in which the author's argument lacks cogency. One is concerned with this defect only to the extent that the major conclusions are affected by it. A book may safely lack cogency in irrelevant respects. It is more difficult to illustrate this third point, because few really good books make obvious slips in reasoning. When they do occur, they are usually elaborately concealed, and it requires a very penetrating reader to discover them. But we can show you a patent fallacy in Machiavelli's *The Prince*. Machiavelli writes: The chief foundations of all states, new as well as old, are good laws. As there cannot be good laws where the state is not well armed, it follows that where they are well armed they have good laws.

Now it simply does not follow from the fact that good laws depend on an adequate police force, that where the police force is adequate, the laws will necessarily be good. We are ignoring the highly questionable character of the first contention. We are only interested in the *non sequitur* here. It is truer to say that happiness depends on health than that good laws depend on an effective police force, but it does not follow that all who are healthy are happy.

In his *Elements of Law*, Hobbes argues in one place that all bodies are nothing but quantities of matter in motion. The world of bodies, he says, has no qualities whatsoever. Then, in another place, he argues that man is himself nothing but a body, or a collection of atomic bodies in motion. Yet, admitting the existence of sensory qualities—colors, odors, tastes, and so forth—he concludes that they are nothing but the motions of atoms in the brain. The conclusion is inconsistent with the position first taken, namely, that the world

of bodies in motion is without qualities. What is said of all bodies in motion must apply to any particular group of them, including the atoms of the brain. This third point of criticism is related to the other two. An author may, of course, fail to draw the conclusions that his evidences or principles imply. Thus his reasoning is incomplete. But we are here concerned primarily with the case in which *he reasons poorly from good grounds*. It is interesting, but less important, to discover lack of cogency in reasoning from premises that are themselves untrue, or from evidences that are inadequate. A person who from sound premises reaches a conclusion invalidly is, in a sense, misinformed. But it is worthwhile to distinguish the kind of erroneous statement that is owing to bad reasoning from the kind previously discussed, which is owing to other defects, especially insufficient knowledge of relevant details. Good Evidence, does not become Bad evidence, because of the Lapse of Time. Double Standards is the sign of failed argument. Inconsistency is the sign of failed Argument

Judging the Author's Completeness

The first three points of criticism, which we have just considered, deal with the soundness of the author's statements and reasoning. Let us turn now to the fourth adverse remark a reader can make. It deals with the completeness of the author's execution of his plan—the adequacy with which he discharges the task he has chosen.

Before we proceed to this fourth remark, one thing should be observed. Since you have said you understand, your failure to support any of these first three remarks obligates you to agree with the author as far as he has gone. You have no freedom of will about this. It is not your sacred privilege to decide whether you are going to agree or disagree.

If you have not been able to show that the author is uninformed, misinformed, or illogical on relevant matters, you simply cannot disagree. You must agree. You cannot say, as so many students and others do, "I find nothing wrong with your premises, and no errors in reasoning, but I don't agree with your conclusions." All you can possibly mean by saying something like that is that you do not *like* the conclusions. You are not disagreeing. You are expressing your emotions or prejudices. If you have been convinced, you should admit it. (If, despite your failure to support one or more of these three critical points, you still honestly feel unconvinced, perhaps you should not have said you understood in the first place.)

The first three remarks are related to the author's terms, propositions, and arguments. These are the elements he used to solve the problems that initiated his efforts. The fourth remark—that the book is incomplete—bears on the structure of the whole.

4. To say that an author's *analysis is incomplete* is to say that he has not solved all the problems he started with, or that he has not made as good a use of his materials as possible, that he did not see all their implications and ramifications, or that he has failed to make distinctions that are relevant to his undertaking. It is not enough to say that a book is incomplete. Anyone can say that of any book. Men are finite, and so are their works, every last one. There is no point in making this remark, therefore, unless the reader can define the inadequacy precisely, either by his own efforts as a knower or through the help of other books.

Let us illustrate this point briefly. The analysis of types of government in Aristotle's *Politics* is incomplete. Because of the limitations of his time and his erroneous acceptance of slavery, Aristotle fails to consider, or for that matter even to conceive, the truly democratic constitution that is based on universal suffrage; nor can he imagine either representative government or the modern kind of federated state. His analysis would have to be extended to apply to these political realities. Euclid's *Elements of Geometry* is an incomplete account because Euclid failed to consider other postulates about the relation of parallel lines. Modern geometrical works, making these other assumptions, supply the deficiencies. Dewey's *How We Think* is an incomplete analysis of thinking because it fails to treat the sort of thinking that occurs in reading or learning by instruction in addition to the sort that occurs in investigation and discovery. To a Christian who believes in personal immortality, the writings of Epictetus or Marcus Aurelius are an incomplete account of human happiness.

This fourth point is strictly not a basis for disagreement. It is critically adverse only to the extent that it marks the limitations of the author's achievement. A reader who agrees with a book in part—because he finds no reason to make any of the other points of adverse criticism—may, nevertheless, suspend judgment on the whole, in the light of this fourth point about the book's incompleteness. Suspended judgment on the reader's part responds to an author's failure to solve his problems perfectly.

Related books in the same field can be critically compared by reference to these four criteria. One is better than another in proportion as it speaks more truth and makes fewer errors. If we are reading for knowledge, that book is best, obviously, which most adequately treats a given subject matter. One author may lack information that another possesses; one may make erroneous suppositions from which another is free; one may be less cogent than another in reasoning from similar grounds. But the profoundest

comparison is made with respect to the completeness of the analysis that each presents. The measure of such completeness is to be found in the number of valid and significant distinctions that the accounts being compared contain. You may see now how useful it is to have a grasp of the author's terms. The number of distinct terms is correlative with the number of distinctions.

You may also see how the fourth critical remark ties together the three stages of analytical reading of any book. The last step of structural outlining is to know the problems that the author is trying to solve. The last step of interpretation is to know which of these problems the author solved and which he did not. The final step of criticism is the point about completeness. It touches structural outlining insofar as it considers how adequately the author has stated his problems, and interpretation insofar as it measures how satisfactorily he has solved them.

The Third Stage of Analytical Reading

We have now completed, in a general way, the enumeration and discussion of the rules of analytical reading. We can now set forth all the rules in their proper order and under appropriate headings.

I. THE FIRST STAGE OF ANALYTICAL READING: RULES FOR FINDING WHAT A BOOK IS ABOUT

- 1. Classify the book according to kind and subject matter.**
- 2. State what the whole book is about with the utmost brevity.**
- 3. Enumerate its major parts in their order and relation, and outline these parts as you have outlined the whole.**
- 4. Define the problem or problems the author has tried to solve.**

II. THE SECOND STAGE OF ANALYTICAL READING: RULES FOR INTERPRETING A BOOK'S CONTENTS

- 5. Come to terms with the author by interpreting his key words.**
- 6. Grasp the author's leading propositions by dealing with his most important sentences.**
- 7. Know the author's arguments, by finding them in, or constructing them out of, sequences of sentences.**
- 8. Determine which of his problems the author has solved, and which he has not; and of the latter, decide which the author knew he had failed to solve.**

III. THE THIRD STAGE OF ANALYTICAL READING: RULES FOR CRITICIZING A BOOK AS A COMMUNICATION OF KNOWLEDGE

A. General Maxims of Intellectual Etiquette

9. Do not begin criticism until you have completed your outline and your interpretation of the book. (Do not say you agree, disagree, or suspend judgment, until you can say "I understand.")
10. Do not disagree disputatiously or contentiously.
11. Demonstrate that you recognise the difference between knowledge and mere personal opinion by presenting good reasons for any critical judgment you make.

B. Special Criteria for Points of Criticism

12. Show where the author is uninformed.

13. Show where the author is misinformed.

14. Show where the author is illogical.

15. Show where the author's analysis or account is incomplete.

Note: Of these last four, the first three are criteria for disagreement.

Failing in all of these, you must agree, at least in part, although you may suspend judgment on the whole, in the light of the last point.

We observed at the end of Chapter 7 that applying the first four rules of analytical reading helps you to answer the first basic question you must ask about a book, namely, *What is the book about as a whole?* Similarly, at the end of Chapter 9, we pointed out that applying the four rules for interpretation helps you to answer the second question you must ask, namely, *What is being said in detail, and how?* It is probably clear that the last seven rules of reading—the maxims of intellectual etiquette and the criteria for points of criticism—help you to answer the third and fourth basic questions you must ask. You will recall that those questions are: *Is it true?* and *What of it?*

The question, *Is it true?* can be asked of anything we read. It is applicable to every kind of writing, in one or another sense of “truth”—mathematical, scientific, philosophical, historical, and poetical. No higher commendation can be given any work of the human mind than to praise it for the measure of truth it has achieved; by the same token, to criticize it adversely for its failure in this respect is to treat it with the seriousness that a serious work deserves. Yet, strangely enough, in recent years, for the first time in Western history, there is a dwindling concern with this criterion of excellence. Books win the plaudits of the critics and gain widespread popular attention almost to the extent that they flout the truth—the more outrageously they do so, the better. Many readers, and most particularly those who review current publications, employ other standards for judging, and praising or condemning, the books they read—their novelty, their sensationalism, their seductiveness, their force, and even their power to bemuse or befuddle the mind, but not their truth, their clarity, or their power to enlighten. They have, perhaps, been brought to this pass by the fact that so much of current writing outside the sphere of the exact sciences manifests so little concern with truth. One might hazard the guess that if saying something that is true, in any sense of that term, were ever again to become the primary concern it should be, fewer books would be written, published, and read.

Unless what you have read is true in some sense, you need go no further. But if it is, you must face the last question. You cannot read for information intelligently without determining what significance is, or should be, attached to the facts presented. Facts seldom come to us without some interpretation, explicit or implied. This is especially true if you are reading digests of information that necessarily select the facts according to some

evaluation of their significance, some principle of interpretation. And if you are reading for enlightenment, there is really no end to the inquiry that, at every stage of learning, is renewed by the question, What of it?

These four questions, as we have already pointed out, summarize all the obligations of a reader. The first three, moreover, correspond to something in the very nature of human discourse. If communications were not complex, structural outlining would be unnecessary. If language were a perfect medium instead of a relatively opaque one, there would be no need for interpretation. If error and ignorance did not circumscribe truth and knowledge, we should not have to be critical. The fourth question turns on the distinction between information and understanding. When the material you have read is itself primarily informational, you are challenged to go further and seek enlightenment. Even when you have been somewhat enlightened by what you have read, you are called upon to continue the search for significance.

Before proceeding to Part Three, perhaps we should stress, once again, that these rules of analytical reading describe an ideal performance. Few people have ever read any book in this ideal manner, and those who have, probably read very few books this way. The ideal remains, however, the measure of achievement. You are a good reader to the degree in which you approximate it.

When we speak of someone as “well-read,” we should have this ideal in mind. Too often, we use that phrase to mean the quantity rather than the quality of reading. A person who has read widely but not well deserves to be pitied rather than praised. As Thomas Hobbes said, “If I read as many books as most men do, I would be as dull-witted as they are.”

The great writers have always been great readers, but that does not mean that they read all the books that, in their day, were listed as the indispensable ones. In many cases, they read fewer books than are now required in most of our colleges, but what they did read, they read well. Because they had mastered these books, they became peers with their authors. They were entitled to become authorities in their own right. In the natural course of events, a good student frequently becomes a teacher, and so, too, a good reader becomes an author.

Our intention here is not to lead you from reading to writing. It is rather to remind you that one approaches the ideal of good reading by applying the rules we have described in the reading of a single book, and not by trying to become superficially acquainted with a larger number. There are, of course, many books worth reading well. There is a much larger number that should be only inspected. To become well-read, in every sense of the word, one must know how to use whatever skill one possesses with discrimination—by reading every book according to its merits.

Deep Work and Syntopicon

Method 23-Syntopicon

The Ultimate Goals of Reading

The Fourth Level of Reading: Syntopical Reading

So far we have not said anything specific about how to read two or more books on the same subject. We have tried to suggest that when certain subjects are discussed, more than one book is relevant, and we have also from time to time mentioned, in a very informal way, certain related books and authors in various fields. Knowing that more than one book is relevant to a particular question is the first requirement in any project of syntopical reading. Knowing which books should be read, in a general way, is the second requirement. The second requirement is a great deal harder to satisfy than the first.

The difficulty becomes evident as soon as we examine the phrase “two or more books on the same subject.” What do we mean by “same subject”? Perhaps this is clear enough when the subject is a single historical period or event, but in hardly any other sphere is there much clarity to be found. *Gone with the Wind* and *War and Peace* are both novels about a great war—but there, for the most part, the resemblance stops. Stendhal’s *The Charterhouse of Parma* is “about” the same conflict—that is, the Napoleonic Wars—that Tolstoy’s novel is “about.” But of course neither is about the war, or indeed about war in general, as such. War provides the context or background of both stories—as it does for much of human life—but it is the stories on which the authors rivet our attention. We may learn something about the war—in fact, Tolstoy once said that he had learned much of what he knew about battles from Stendhal’s account of the Battle of Waterloo—but we do not go to these novels or any others if our primary intention is to study war.

You could have anticipated that this situation would obtain in the case of fiction. It is inherent in the fact that the novelist does not communicate in the same way that an expository writer does. But the situation obtains in the case of expository works, as well.

Suppose, for example, that you are interested in reading about the idea of love. Since the literature of love is vast, you would have relatively little difficulty in creating a bibliography of books to read. Suppose that you have done that, by asking advisors, by searching through the card catalogue of a good library, and by examining the bibliography in a good scholarly treatise on the subject. And suppose in addition that you have confined yourself to expository works, despite the undoubted interest of novelists and poets in the subject. (We will explain why it would be advisable to do this later.) You now begin to examine the books in your bibliography. What do you find?

Even a cursory perusal reveals a very great range of reference. There is hardly a single human action that has not been called—in one way or another—an act of love. Nor is the range confined to the human sphere. If you proceed far enough in your reading, you

will find that love has been attributed to almost everything in the universe; that is, everything that exists has been said by someone either to love or to be loved—or both.

Stones are said to love the center of the earth. The upward motion of fire is called a function of its love. The attraction of iron filings to a magnet is described as an effect of love. Tracts have been written on the love life of amoebae, paramecia, snails, and ants, to say nothing of most of the so-called higher animals, who are said to love their masters as well as one another. When we come to human beings, we discover that authors speak and write of their love for men, women, a woman, a man, children, themselves, mankind, money, art, domesticity, principles, a cause, an occupation or profession, adventure, security, ideas, a country life, loving itself, a beefsteak, or wine. In certain learned treatises, the motions of the heavenly bodies are said to be inspired by love; in others, angels and devils are differentiated by the quality of their love. And of course God is said to *be* Love.

Confronted with this enormous range of reference, how are we to state what the subject is that we are investigating? Can we even be sure that there is a single subject? When one person says “I love cheese,” and another says “I love football,” and a third says “I love mankind,” are they all three using the word in any sense that is common? After all, one eats cheese but not football or mankind, one plays football but not cheese or mankind, and whatever “I love mankind” means, that meaning does not seem to be applicable to cheese or football. And yet all three do use the same word. Is there in fact some deep reason for that, some reason that is not immediately apparent on the surface? Difficult as that question is, can we say that we have identified the “same subject” until we have answered it?

Faced with this chaotic situation, you may decide to limit the enquiry to human love—to love between human beings, of the same sex or different sexes, of the same age or different ages, and so forth. That would rule out the three statements we have just discussed. But you would still find, even if you read only a small portion of the available books about the subject, a very great range of reference. You would find, for instance, that love is said by some writers to consist wholly in acquisitive desire, usually sexual desire; that is, love is merely a name for the attraction that almost all animals feel toward members of the opposite sex. But you would also find other authors who maintain that love, properly speaking, contains no acquisitive desire whatever, and consists in pure benevolence. Do acquisitive desire and benevolence have anything in common, considering that acquisitive desire always implies wanting some good *for oneself*, while benevolence implies wanting a good *for someone else*?

At least acquisitive desire and benevolence share a common note of tendency, of desire in some very abstract sense of the term. But your investigation of the literature of the subject would soon uncover writers who conceive of the essence of love as being cognitive rather than appetitive. Love, these writers maintain, is an intellectual act, not an emotional one. In other words, *knowing* that another person is *admirable* always precedes *desiring* him or her, in either of the two senses of desire. Such authors do not deny that desire enters into the picture, but they do deny that desire should be called love.

Let us suppose—in fact, we think it can be done—that you are able to identify some common meaning in these various conceptions of human love. Even then not all of your problems are solved. Consider the ways in which love manifests itself between and among human beings. Is the love that a man and woman have for each other the same when they are courting as when they are married, the same when they are in their twenties as when they are in their seventies? Is the love that a woman has for her husband the same as that she has for her children? Does a mother's love for her children change as they grow up? Is the love of a brother for his sister the same as his love for his father? Does a child's love for its parents change as he or she grows? Is the love that a man has for a woman, either his wife or some other, the same as the friendship he feels for another man, and does it make a difference what relationship he has with the man—such as one with whom he goes bowling, one with whom he works, and one whose intellectual company he enjoys? Does the fact that “love” and “friendship” are different words mean that the emotions they name (if that is in fact what they name) differ? Can two men of different ages be friends? Can they be friends if they are markedly different in some other respect, such as possession of wealth or degree of intelligence? Can women be friends at all? Can brothers and sisters be friends, or brother and brother, or sister and sister? Can you retain a friendship with someone you either borrow money from or lend it to? If not, why not? Can a boy love his teacher? Does it make a difference whether the teacher is male or female? If humanoid robots existed, could human beings love them? If we discovered intelligent beings on Mars or some other planet, could we love them? Can we love someone we have never met, like a movie star or the President? If we feel that we hate someone, is that really an expression of love?

These are just a few of the questions that would be raised by your reading of even a part of the standard expository literature of love. There are many other questions that could be asked. However, we think we have made the point. A curious paradox is involved in any project of syntopical reading. Although this level of reading is defined as the reading of two or more books on the same subject, which implies that the identification of the subject matter occurs before the reading begins, it is in a sense true that the identification of the subject matter must follow the reading, not precede it. In the case of love, you might have to read a dozen or a hundred works before you could decide what you were reading about. And when you had done that, you might have to conclude that half of the works you had read were not on the subject at all.

The Role of Inspection in Syntopical Reading

We have stated more than once that the levels of reading are cumulative, that a higher level includes all of those that precede or lie below it. It is now time to explain what that means in the case of syntopical reading.

You will recall that in explaining the relationship between inspectional reading and analytical reading, we pointed out that the two steps in inspectional reading— first, skimming; and second, superficial reading—anticipated the first two steps in analytical reading. Skimming helps to prepare you for the first step of analytical reading, in the course of which you identify the subject matter of whatever you are reading, state what kind of book it is, and outline its structure. Superficial reading, while it is also helpful in that first step of analytical reading, is primarily a preparation for the second step, when you are called upon to interpret a book's contents by coming to terms with the author, stating his propositions, and following his arguments.

In a somewhat analogous fashion, both inspectional and analytical reading can be considered as anticipations or preparations for syntopical reading. It is here, in fact, that inspectional reading comes into its own as a major tool or instrument for the reader.

Let us suppose once more that you have a bibliography of a hundred or so titles, all of which appear to be on the subject of love. If you read every one of them analytically, you would not only end up with a fairly clear idea of the subject that you were investigating—the “same subject” of the syntopical reading project—but you would also know which, if any, of the books you had read were not on that subject and thus irrelevant to your needs. But to read a hundred books analytically might well take you ten years. If you were able to devote full time to the project, it would still take many months. Some shortcut is obviously necessary, in the face of the paradox we have mentioned concerning syntopical reading.

That shortcut is provided by your skill in inspectional reading. The first thing to do when you have amassed your bibliography is to *inspect all of the books on your list*. You should not read any of them analytically before inspecting *all* of them. Inspectional reading will not acquaint you with all of the intricacies of the subject matter, or with all of the insights that your authors can provide, but it will perform two essential functions. First, it will give you a clear enough idea of your subject so that your subsequent analytical reading of *some* of the books on the list is productive. And second, it will allow you to cut down your bibliography to a more manageable size.

We can hardly think of any advice that would be more useful for students, especially graduate and research students, than this, if they would only heed it. In our experience, a certain number of students at those advanced levels of schooling have some capability of reading actively and analytically. There may not be enough of them, and they may be far from perfect readers, but they at least know how to get at the meat of a book, to make reasonably intelligible statements about it, and to fit it into a plot or plan of their subject matter. But their efforts are enormously wasteful because they do not understand *how to*

read some books faster than others. They spend the same amount of time and effort on every book or article they read. As a result, they do not read those books that deserve a really good reading as well as they deserve, and they waste time on works that deserve less attention.

The skilful inspectional reader does more than classify a book in his mental card catalogue, and achieve a superficial knowledge of its contents. He also discovers, in the very short time it takes him to inspect it, *whether the book says something important about his subject or not.* He may not yet know what that something is precisely—that discovery will probably have to wait for another reading. But he has learned one of two things. Either the book is one to which he must return for light, or it is one that, no matter how enjoyable or informative, contains no enlightenment and therefore does not have to be read again.

There is a reason why this advice is often unheeded. In the case of analytical reading, we said that the skillful reader performs concurrently steps that the beginner must treat as separate. By analogy, it might seem that this kind of preparation for syntopical reading—the inspection of all of the books on your list before starting the analytical reading of any of them—could be done concurrently with analytical reading. But we do not believe that can be done by any reader, no matter how skillful. And this indeed is the mistake that so many younger researchers make. Thinking they can collapse these two steps into one, they end up reading everything at the same rate, which may be either too fast or too slow for a particular work, but in any event is wrong for most of the books they read.

Once you have identified, by inspection, the books that are relevant to your subject matter, you can then proceed to read them syntopically. Note that in the last sentence we did not say “proceed to read them analytically,” as you might have expected. In a sense, of course, you do have to read each of the individual works that, together, constitute the literature of your subject, with those skills that you acquired by applying the rules of analytical reading. But it must never be forgotten that *the art of analytical reading applies to the reading of a single book*, when understanding of that book is the aim in view. As we will see, the aim in syntopical reading is quite different.

The Steps in Syntopical Reading

We are now prepared to explain how to read syntopically. We will assume that, by your inspection of a number of books, you have a pretty good idea of the subject that at least some of them are about, and furthermore that this is the subject you want to investigate. What, then, do you do?

There are five steps in syntopical reading. We shall not call them rules, although we might, for if any of the steps is not taken, syntopical reading becomes much more difficult, perhaps impossible. We will discuss them roughly in the order in which they occur, although in a sense all of them have to take place for any of them to.

Step 1. Create a tentative bibliography of your subject by recourse to library catalogues, advisors, and bibliographies in books.

Step 2. Inspect *all* of the books on the tentative bibliography to ascertain which are germane to your subject, and also to acquire a clearer idea of the subject. **Note:** These two steps are not, strictly speaking, chronologically distinct; that is, the two steps have an effect on each other, with the second, in particular, serving to modify the first.

STEP 3 IN SYNTOPICAL READING: FINDING THE RELEVANT PASSAGES. Since we are of course assuming that you know how to read analytically, we are assuming that you could read each of the relevant books thoroughly if you wanted to. But that would be to place the individual books first in the order of your priorities, and your problem second. In fact, the order is reversed. *In syntopical reading, it is you and your concerns that are primarily to be served, not the books that you read. First, the topic in connection with which the passage is being read serves to give direction to the reader in interpreting the passage. But it does not tell him what the passage means, since the passage may be relevant to the topic in several or many different ways. Hence the reader is called upon to discover precisely what relevance the passage has to the topic. To learn to do this is to acquire a major skill in the art of reading.*

Hence the first step at this level of reading is another inspection of the whole works that you have identified as relevant. Your aim is to find the passages in the books that are most germane to your needs. It is unlikely that the whole of any of the books is directly on the subject you have chosen or that is troubling you. Even if this is so, as it very rarely is, you should read the book quickly. You do not want to lose sight of the fact that you are reading it for an ulterior purpose—namely, for the light it may throw on your own problem—not for its own sake.

It might seem that this step could be taken concurrently with the previously described inspection of the book, the purpose of which was to discover whether the book was at all relevant to your concerns. In many cases, that is so. But it is unwise to consider that this is always possible. Remember that one of the aims of your first inspection of the book was to zero in on the subject matter of your syntopical reading project. We have said that an

adequate understanding of the problem is not always available until you have inspected many of the books on your original list. Therefore, to try to identify the *relevant passages* at the same time that you identify the *relevant books* is often perilous. Unless you are very skillful, or already quite familiar with your subject, you had better treat the two steps as separate.

What is important here is to recognize the difference between the first books that you read in the course of syntopical reading, and those that you come to after you have read many others on the subject. In the case of the later books, you probably already have a fairly clear idea of your problem, and in that case the two steps can coalesce. But at the beginning, they should be kept rigorously separated. Otherwise, you are likely to make serious mistakes in identifying the relevant passages, mistakes that will have to be corrected later with a consequent waste of time and effort.

Above all, remember that your task is not so much to achieve an overall understanding of the particular book before you as to find out how it can be useful to you *in a connection that may be very far from the author's own purpose in writing it*. That does not matter at this stage of the proceedings. The author can help you to solve your own problem without having intended to. In syntopical reading, as we have noted, the books that are read serve you, not the other way around. In this sense, syntopical reading is the most active reading you can do. Analytical reading is also active, of course. But when you read a book analytically, you put yourself in a relation to it of disciple to master. When you read syntopically, *you* must be the master of the situation.

Because this is so, you must go about the business of coming to terms with your authors in a somewhat different way than before.

STEP 4 Use Rules of Reading by Analysing the various text. IN SYNTOPICAL READING: BRINGING THE AUTHORS TO TERMS. In interpretive reading (the second stage of analytical reading) the first rule requires you to come to terms with the author, which means identifying his key words and discovering how he uses them. But now you are faced with a number of different authors, and it is unlikely that they will have all used the same words, or even the same terms. *Thus it is you who must establish the terms, and bring your authors to them rather than the other way around.* First the collection of a number of passages on the same topic, but from different works and different authors, serves to *sharpen the reader's interpretation of each passage read*. Sometimes, when passages from the same book are read in sequence and in the context of one another, each becomes clearer. Sometimes the meaning of each of a series of contrasting or conflicting passages from different books is accentuated when they are read against one another. And sometimes the passages from one author, by amplifying or commenting on the passages from another, materially help the reader's understanding of the second author. *Second* if syntopical reading is done on a number of different subjects, the fact that the same passage will often be found cited in the Syntopicon under two or more subjects will have its instructive effect. The passage has an amplitude of meaning that the reader will come to perceive as he interprets it somewhat differently in relation to different

topics. Such multiple interpretation not only is a basic exercise in the art of reading but also tends to make the mind habitually alert to the many strains of meaning that any rich or complex passage can contain.

This is probably the most difficult step in syntopical reading. What it really comes down to is forcing an author *to use your language, rather than using his*. All of our normal reading habits are opposed to this. As we have pointed out several times, we assume that the author of a book we want to read analytically is our better, and this is particularly true if the book is a great one. Our tendency is to accept the author's terms and his organization of the subject matter, no matter how active we may be in trying to understand him. In syntopical reading, however, we will very quickly be lost if we accept any one author's terminology. We may understand *his* book, but we will fail to understand the others, and we will find that not much light is shed on the subject in which we are interested.

Not only must we resolutely refuse to accept the terminology of *any one* author; we must also be willing to face the possibility that *no* author's terminology will be useful to us. In other words, we must accept the fact that coincidence of terminology between us and any of the authors on our list is merely accidental. Often, indeed, such coincidence will be inconvenient; for if we use one term or set of terms of an author, we may be tempted to use others among his terms, and these may get in the way rather than help.

Syntopical reading, in short, is to a large extent an exercise in translation. We do not have to translate from one natural language to another, as from French to English. But we do impose a common terminology on a number of authors who, whatever natural language they may have shared in common, may not have been specifically concerned with the problem we are trying to solve, and therefore may not have created the ideal terminology for dealing with it.

This means that as we proceed on our project of syntopical reading we must begin to build up a set of terms that first, helps us to understand all of our authors, not just one or a few of them, and second, helps us to solve our problem. That insight leads to the third step.

STEP 5 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: GETTING THE QUESTIONS CLEAR. The second rule of interpretive reading requires us to find the author's key sentences, and from them to develop an understanding of his propositions. Propositions are made up of terms, and of course we must do a similar job on the works we are reading syntopically. But since we ourselves are establishing the terminology in this case, we are *faced with the task of establishing a set of neutral propositions as well*. The best way to do this is to frame a set of questions that shed light on our problem, and to which each of our authors gives answers.

This, too, is difficult. The questions must be stated in such a way and in such an order that they help us to solve the problem we started with, but they also must be framed in such a way that all or most of our authors can be interpreted as giving answers to them.

The difficulty is that the questions we want answered may not have been seen as questions by the authors. Their view of the subject may have been quite different from ours.

Sometimes, indeed, we have to accept the fact that an author gives *no* answer to one or more of our questions. In that case, we must record him as silent or indeterminate on the question. But even if he does not discuss the question explicitly, we can sometimes find an implicit answer in his book. *If* he had considered the question, we may conclude, he would *then* have answered it in such and such a way. Restraint is necessary here; we cannot put thoughts into our authors' minds, or words into their mouths. But we also cannot depend entirely on their explicit statements about the problem. If we could depend on any one of them in that way, we probably would have no problem to solve.

We have said that the questions must be put in an order that is helpful to us in our investigation. The order depends on the subject, of course, but some general directions can be suggested. The first questions usually have to do with *the existence or character of the phenomenon or idea we are investigating*. If an author says that the phenomenon exists or that the idea has a certain character, then we may ask further questions of his book. These may have to do with *how the phenomenon is known or how the idea manifests itself*. A final set of questions might have to do with *the consequences of the answers to the previous questions*.

We should not expect that all of our authors will answer our questions in the same way. If they did, we would once again have no problem to solve; it would have been solved by consensus. Since the authors will differ, we are faced with having to take the next step in syntopical reading.

STEP 6 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: DEFINING THE ISSUES. If a question is clear, and if we can be reasonably certain that authors answer it in different ways— perhaps pro and con— then an issue has been defined. It is the issue between the authors who answer the question in one way, and those who answer it in one or another opposing way.

STEP 7 Use One of Rules of Reading Methods For Full Analysis of Texts.

STEP 8 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Context Of Author's text.

1. What is Immediate Context?
2. What is the Book Context?

STEP 9 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. What are The Facts Within Context of an Author.

STEP 10 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Grammar Of Texts.

STEP 11 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Logic Of Texts.

Step 12- Discourse Analysis of The Text

A. Use the Following Books for Discourse Analysis:

- Critical Discourse Analysis_ The Critical Study of Language.
- Discourse analysis.
- The Routledge handbook of discourse analysis.

Step 13- Facts within The Context.

Step 14- Do the Fact Checking. Checking Facts, If they are correct or incorrect.

A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.

- Fact Checking Process.
- Verification Handbook.
- The Data Journalism.
- Data Journalism - Centre for Investigative Journalism.
- Tutorial-computational-fact-checking-a-content-management-perspective.
- Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
- Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
- The Effect of Fact-checking on Elites.
- Why do journalists fact-check.
- Fact-checking 101.
- Sagan-Baloney.
- Fact Checking.

B. Research the Facts, figures and ideas and do fact checking, if these are true or false through:

- C. Do full fact checking of the facts the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- D. Do full fact checking of the figures the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- E. Do full fact checking of the statistics the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- F. Do full fact checking of the formulas the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- G. Do full fact checking of the mathematical results the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- H. Do full fact checking of the evidences the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- I. Any other information author provided do full fact checking.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

Step 15 Bias vs Unbiased

- A. Listen and read if the author is biased or unbiased.
- B. Is the author best representative for one or another side?
- C. Is the author bias or not? What is the author's bias and purpose?
- D. Does the speaker or writer have personal or professional interest in the information they are presenting?
- E. How a writer might purposely present ideas or events in ways that favour a particular political party/organisation/religion/social group?
- F. Does the author presents facts and explain the ideas to reader or listener?
- G. Is the author uses facts and opinions to argue for or against some idea?
- H. Is the author tries to amuse or interest the reader with humour, suspense, intense and stories?
- I. Look at the language in the passage?
 - If it is neutral and objective, the purpose is probably simply to inform the reader?
 - If is includes terms and are strongly positive, negative or emotional, the purpose is probably to persuade the reader?
 - It is include situations or descriptions that are funny, surprising or intriguing the writer, probably wants to entertain the reader?
- J. Is the author biased?
 - Is the author presenting only one side of an argument?
 - Is it include only facts and examples that support writer's opinion?
 - Is it using the language intended to influence the reader's emotions?
 - Is it ridicules other opinions or views?
- K. Does the author have contradictory information, cherry picked evidence or carefully select language in which to present information favourably?
- L. Is the author or speaker speaks/writes for company, special interest group, an institute foundation think tank or political party?
- M. Does the author/writer gets paid or provided any gift for endorsement or opinion?
- N. Does the person have interest on this topic or has any personal gain? If not then this writer/speaker is disinterested, impartial/unbiased objective.
- O. If the speaker/writer has interest, then why does she/he present the information/ data in such a way?
- P. In surveys or studies has the author worded the question in such a way to ensure the sought-after response?

- Q. Is the company paid the author to prove that the device or product is better than any other product in the market?
- R. Is the marketer or industry trying to defend the product? Did the author put the best spin on its information?
- S. When was the survey or studies or experiment done?
- T. What day were the tests, survey or experiment done?
- U. Purpose of the author writing?
- V. How did the author handle opposing views? Is the author trying to persuade the reader to some belief?
- W. Does the author fairly handle the opposing view? Or did the author dismiss opposing points without regard to their possible value?
- X. Does the writer make any straw man fallacy, misrepresenting opposing views to more easily knock them down?
- Y. Did the author use slanted language or commit personal attack?
- Z. Does the writer use sweeping generalisation or demonstrate an either/or approach to complicated issues, thereby revealing a strong bias toward one side?
- AA. Does the writer pretend to be objective?
- BB. Does the writer intend to be ironic or satirical, if she or he is clearly exaggerating for effect?
- CC. Does the writer admit to guesswork and speculation?

Step 16. Checking Each Fact's Sources, If they Are Reliable or Unreliable. Sources the author used

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Listen or read what sources of information Author used
- C. What are the author's sources?
- Did the writer respond to those who have preceded them?
 - Has the writer depended on the primary/secondary/tertiary sources?
 - Has the writer misquoted the primary/secondary/tertiary or has he quoted the primary/secondary/tertiary source?
 - Has the writer uses statistics or data, has he used primary/secondary/tertiary source?
 - Has the writer interpreted the data or survey or statistics biased/unbiased?
 - Has the author correctly interpreted the information?
 - Has the author incorrectly interpreted information?
 - Search the very sources author uses and see if the author interpreted the information in correct way.
 - Has the author uses trust sources for the work he has written?

D. Is the Source Reliable or Unreliable?

E. Sources

- Is the author uses primary source in presenting some data or facts in his/her newspaper, article, book journal?
 1. Is the primary source reliable, fair, ethical and trustworthy?
 2. Is the primary source sloppy, biased, unethical?
 3. Is the primary source objective when they speaking about certain subject?
 4. Are the primary source present facts carefully or careless?
 5. Is the primary source truthfully presenting the facts, opinions and data?
 6. Who is the writer? Is he /she qualified expert to write about this topic?
 7. Did the write done proper research regarding the topic?
 8. What is the tone?
 9. What is the purpose of publication?
 10. What assumption does the author make?
 11. What are the bases of author's conclusions?
 12. Does the author agree or disagree with other authors on the subject?
 13. Was this written in regards of the counterargument other authors who have opposite views?
 14. Does the content agree or disagree with author/authors on the subject?
 15. Does the content agree or disagree with what you know or have learned about the issue?
 16. Where was the source made?
 17. Where is the material from? Is this a valid source of information?

F. Is the Source Reliable or Unreliable?

- What primary sources did the author use. This is the list of primary source:
 1. Data and original research.
 2. Diaries and journals.
 3. Letters and memos.
 4. Autobiographies and memoirs.
 5. Books or articles written at the time of event?
 6. Government documents.
 7. Census statistics.
 8. Organisational records.
 9. Documentaries.
 10. photographs, art (from the time period).
 11. Maps (from the period).
 12. Patents.
 13. Theses.
 14. Dissertations.
 15. Photographs.
 16. Journal articles.
 17. Newspaper articles.
 18. Survey research research.
 19. Meetings.
 20. Symposia.
 21. Original documents.
 22. Records of organisation.
 23. Internet.
 24. Email.
 25. Communication in listservs.
 26. Interviews.
 27. Video recordings.
 28. Audio recordings.
 29. Websites.
 30. Communication through social media.
 31. Artefacts.
 32. Reports.
 33. Works of art and architecture.
 34. Eyewitness.

- 35. Statistics.
- 36. Oral history.
- 37. Description of travel.
- 38. Cartoon.
- 39. Postcards.
- 40. Posters.
- 41. Internet communications.
- 42. Any above reprinted in the original format and language.

- Is the author use secondary source in presenting some data or facts in his/her newspaper, articles, book, magazine/, journal?
 1. Is the second hand source reliable, fair ethical and trustworthy?
 2. Is the second hand source being sloppy, biased, unethical in their quoting paraphrasing and summarising?
 3. Is the secondary source objectively when they are speaking about certain subject?
 4. Are the secondary source present facts carefully or careless?
 5. Is the secondary source truthfully presents the facts opinions/data?
 6. Is the secondary data was accepted blind faith or skeptically analysed by author?
 7. What secondary source did the author use? This is the list of secondary sources:
 - Encyclopedia
 - Chronologies
 - Biographies
 - Monographs
 - Most journal article
 - Literary criticism
 - Political analysis
 - Review of law and legislations
 - Essay on morals and ethics
 - Analyses of social policy
 - Study and teaching material
 - Literature reviews
 - Research articles
 - Criticism of works of literature, art and music
 - Most published books
 - Abstract of articles
 - Paraphrased quotation
 - Dictionaries, Textbooks
 - Commentaries
 - Magazines and newspaper articles
 - Website
 8. Is the Source Reliable or Unreliable?

- Is the author use tertiary source in presenting some data or facts in her newspaper, articles, book journal or magazine
 1. Is the tertiary hand source reliable, fair, ethical and trustworthy?
 2. Is the tertiary hand source being sloppy, biased, unethical in their quoting, paraphrasing and summarising.
 3. Is the tertiary source objectively when they are speaking about certain subject?
 4. Are the tertiary source present facts carefully or careless?
 5. Is the tertiary source truthfully presents the facts opinions/data?
 6. Is the tertiary data was accepted blind faith or skeptically analysed by author?
 7. What tertiary source did the author use? List:
 - Almanacs
 - Bibliographies
 - Classification
 - Population registers
 - Chronologies
 - Dictionaries
 - Encyclopedias
 - Directories
 - Fact books
 - Guidebooks
 - Indexes
 - Abstract sources
 - Manuals textbooks
 - Handbooks
 - Wikipedia
 - Concordance
 - Field guides
 - Timelines
 - Surveys
 - Overview articles
 - Directories
 8. Is the Source Reliable or Unreliable?

STEP 17 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Rhetoric Of Texts.

A. Open Rhetorical Analysis Folder. Use The Following Books For Rhetorical Analysis of The Book:

- Rhetoric By Aristotle.
- A Companion to Rhetoric and Rhetorical Criticism.
- Ancient Rhetoric From Aristotle to Philostratus.
- Ancient Rhetoric For Contemporary Students by Sharon Crowley.
- Art Of Rhetoric By Aristotle.
- Conversations In American Literature: Language, Rhetoric, Culture By Robin Aufses.
- Encyclopaedia of Rhetoric.
- On Rhetoric: Theory of Civic Discourse by Aristotle.
- Politics and Rhetoric: The Persuasive Power of Metaphor.
- Rhetoric By Jennifer Richards.
- Rhetoric In Details By John Benjamins.
- Rhetorical Grammar By Martha Kolln.
- Sourcebook on Rhetoric By James Jasinski.
- The Language of Composition: Reading, Writing, Rhetoric by Renee Shea.
- The Longman Writer_ Rhetoric, Reader, Research Guide, and Handbook.
- The Rhetoric of Reason By James Crosswhite.
- Trivium- Liberal Arts of Logic, Grammar and Rhetoric By Sister Mirriam Joseph.
- Writing Arguments: a RHETORIC With Reading by John Ramage.

B. Follow Every step of the Book, I have chose to do Rhetorical Analysis.

When only two answers are given by all of the authors examined, the issue is a relatively simple one. Often, more than two alternative answers are given to a question. In that case, the opposing answers must be ordered in relation to one another, and the authors who adopt them classified according to their views.

An issue is truly joined when two authors who understand a question in the same way answer it in contrary or contradictory ways. But this does not happen as often as one might wish. Usually, differences in answers must be ascribed to *different conceptions of the question* as often as to *different views of the subject*. The task of the syntopical reader is to define the issues in such a way as to insure that they are joined as well as may be. Sometimes this forces him to frame the question in a way that is not explicitly employed by any author.

There may be many issues involved in the discussion of the problem we are dealing with, but it is likely that they will fall into groups. Questions about the character of the idea under consideration, for example, may generate a number of issues that are connected. A number of issues revolving around a closely connected set of questions may be termed the *controversy* about that aspect of the subject. Such a controversy may be very complicated, and it is the task of the syntopical reader to sort it out and arrange it in an orderly and perspicuous fashion, even if no author has managed to do that. This sorting and arranging of the controversies, as well as of the constituent issues, brings us to the final step in syntopical reading.

STEP 18 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. So far we have found the relevant passages in the works examined, created a neutral terminology that applies to all or most of the authors examined, framed and ordered a set of questions that most of them can be interpreted as answering, and defined and arranged the issues produced by differing answers to the questions. What then remains to be done?

The first four steps correspond to the first two groups of rules for analytical reading. Those rules, when followed and applied to any book, allowed us to answer the questions, What does it say? and How does it say it? In our syntopical reading project, we are similarly able at this point to answer the same questions about the discussion concerning our problem. In the case of the analytical reading of a single work, two further questions remained to be answered, namely, Is it true? and What of it? In the case of syntopical reading, we are now prepared to address ourselves to similar questions about the discussion.

Let us assume that the problem with which we began was not a simple one, but was rather one of those perennial problems with which thinkers have struggled for centuries, and about which good men have disagreed and can continue to disagree. We should recognize, on this assumption, that our task as syntopical readers is not merely to answer the questions ourselves—the questions that we have so carefully framed and ordered both to elucidate the discussion of the subject and the subject itself. The truth about a problem

of this sort is not found so easily. In fact, we would probably be presumptuous to expect that the truth could be found in any one set of answers to the questions. Rather, it is to be found, if at all, in *the conflict of opposing answers*, many if not all of which may have persuasive evidence and convincing reasons to support them.

The truth, then, insofar as it can be found—the solution to the problem, insofar as that is available to us—consists rather in the *ordered discussion itself* than in any set of propositions or assertions about it. Thus, in order to present this truth to our minds—and to the minds of others—we have to do more than merely ask and answer the questions. We have to ask them in a certain order, and be able to defend that order; we must show how the questions are answered differently and try to say why; and we must be able to point to the texts in the books examined that support our classification of answers. Only when we have done all of this can we claim to have analysed the discussion of our problem. And only then can we claim to have understood it.

We may, indeed, have done more than that. A thorough analysis of the discussion of a problem may provide the groundwork for further productive work on the problem by others. It can clear away the deadwood and prepare the way for an original thinker to make a breakthrough. Without the work of analysis, that might not have been possible, for the dimensions of the problem might not have been visible.

The Need for Objectivity

An adequate analysis of the discussion of a problem or subject matter identifies and reports the major issues, or basic intellectual oppositions, in that discussion. This does not imply that disagreement is always the dominant feature of every discussion. On the contrary, agreement in most cases accompanies disagreement; that is, on most issues, the opinions or views that present opposite sides of the dispute are shared by several authors, often by many. Seldom do we find a solitary exponent of a controversial position.

The agreement of human beings about the nature of things in any field of inquiry establishes some presumption of the truth of the opinions they commonly hold. But their disagreement establishes the counter-presumption—that *none* of the opinions in conflict, whether shared or not, may be wholly true. Among conflicting opinions, one may, of course, be wholly true and all the rest false; but it is also possible that each expresses *some portion of the whole truth*; and, except for flat and isolated contradictions (which are rare in any discussion of the kind of problems we are dealing with here), it is even possible that *all the conflicting opinions may be false*, just as it is possible for that opinion to be false on which all seem to agree. Some opinion as yet unexpressed may be the truth or nearer to it.

This is another way of saying that the aim of a project of syntopical reading is not final answers to the questions that are developed in the course of it, or the final solution of the problem with which the project began. This is particularly true of the report we might try to make of such syntopical reading. It would be dogmatic, not dialectical, if, on any of the important issues that it identified and analyzed, it asserted or tried to prove the truth or falsity of any view. If it did that, the syntopical analysis would cease to be syntopical; it would become simply one more voice in the discussion, thereby losing its detached and objective character.

The point is not that one more voice carries no weight in the forum of human discussion on important issues. The point is that a different type of contribution to the pursuit of understanding can and should be made. And this contribution consists in being resolutely objective and detached throughout. The special quality that a syntopical analysis tries to achieve can, indeed, be summarized in the two words “dialectical objectivity.”

The syntopical reader, in short, tries to *look at all sides and to take no sides*. Of course, he will fail in this exacting ideal. Absolute objectivity is not humanly possible. He may succeed in taking no sides, presenting the issues without prejudice to any partisan point of view, and treating opposing views impartially. But it is easier to take no sides than to look at all sides. In this latter respect, the syntopical reader will undoubtedly fail. All possible sides of an issue cannot be exhaustively enumerated. Nevertheless, he must try.

Taking no sides is easier than looking at all sides, we say, but it remains difficult even so. The syntopical reader must resist certain temptations and know his own mind. Perfect dialectical objectivity is not guaranteed by avoiding *explicit* judgments on the truth of conflicting opinions. Partiality can intrude in a variety of subtle ways —by the manner in which arguments are summarised, by shades of emphasis and neglect, by the tone of a

question or the colour of a passing remark, and by the order in which the various different answers to key questions are presented.

In order to avoid some of these dangers, the conscientious syntopical reader may resort to one obvious device and use it as much as possible. That is, *he must constantly refer back to the actual text of his authors*, reading the relevant passages over and over; and, in presenting the results of his work to a wider audience, he must quote the opinion or argument of an author in the writer's own language. Although it may appear to do so, this does not contradict what we said earlier about the necessity of finding a neutral terminology in which to analyze the problem. That necessity remains, and when summaries of an author's argument are presented, they must be presented in that language and not the author's. But the author's own words, carefully quoted so as not to wrench them out of context, must accompany the summary, so that the reader can judge for himself whether the interpretation of the author is correct.

Only the syntopical reader's firm intention to avoid them can be relied on to prevent other sorts of departure from dialectical objectivity. That ideal demands a deliberate effort to balance question against question, to forgo any comment that might be prejudicial, to check any tendency toward overemphasis or underemphasis. In the last analysis, although a reader may be the judge of the effectiveness of a written report of a dialectical exposition, only the writer of it—only the syntopical reader himself—can know whether he has satisfied these requirements.

An Example of an Exercise in Syntopical Reading: The Idea of Progress

An example may be helpful to explain how syntopical reading works. Let us consider the idea of progress. We do not take this subject at random. We have done extensive research on it. The example would not be so useful to you if that were not so.

The investigation of this important historical and philosophical idea occupied several years. The first task was to produce a list of works to be examined for relevant passages—to amass a bibliography (it finally ran to more than 450 items). This task was accomplished by a series of inspectional readings of several times that many books, articles, and other pieces. It is important to point out that in the case of the idea of progress, as would be true in the case of most other important ideas, many of the items finally judged to be relevant were found more or less by accident, or at least with the help of educated guesses. There were obvious places to start; many recent books contain the word “progress” in their titles. But others do not, and most of the older books, although relevant to the subject, do not even employ the term.

A few fictional and poetical works were read, but on the whole it was decided to concentrate on expository works. We have already observed that including novels, plays, and poems in a syntopical reading project is difficult, and this is so for several reasons. First of all, the backbone or essence of a story is its plot, not its positions on issues. Second, even the most talkative characters seldom take clear positions on an issue—they tend to talk, in the story, about other matters, mainly emotional relations. Third, even if a character does make such a speech—as, for example, Settembrini does about progress in Thomas Mann’s *Magic Mountain*—we can never be sure that it is the *author’s* view that is being represented. Is the author being ironic in allowing his character to go on about the subject? Is he intending you to see the foolishness of the position, rather than its wisdom? Generally speaking, an intensive effort of synthetic interpretation is required before a fictional work can be placed on one side or another of an issue. The effort is so great, and the results essentially so dubious, that usually it is prudent to abstain.

The discussion of progress in the many works that remained to be examined was, as is usually the case, apparently chaotic. Faced with this fact, the task was, as we have indicated, to develop a neutral terminology. This was a complex undertaking, but one example may help to explain what was done.

The word “progress” itself is used by authors in a number of different ways. Most of these different ways reflect no more than shades of meaning, and they can be handled in the analysis. But the word is used by *some* authors to denote a certain kind of movement forward in history that is not an improvement. Since *most* of the authors use the word to denote a historical change in the human condition that is for the better, and since betterment is of the essence of the conception, the same word could not be applied to both views. In this case, the majority gained the day, and the minority faction had to be referred to as authors who assert “non-meliorative advance” in history. The point is that when

discussing the views of the minority faction, *we could not employ the word “progress,” even though the authors involved had used it themselves.*

The third step in syntopical reading is, as we have noted, getting the questions clear. Our intuition about the primary question in the case of progress turned out to be correct upon examination. The first question to ask, the question to which authors can be interpreted as giving various answers, is, Does progress occur in history? Is it a fact that the general course of historical change is in the direction of improvement in man's condition? Basically, there are three different answers to this question put forth in the literature of the subject: (1) Yes, (2) No, and (3) We cannot know. However, there are a number of different ways of saying Yes, several different ways of saying No, and at least three different ways of saying that we cannot know whether human progress occurs or not.

The multifarious and interrelated answers to this primary question constitute what we decided to call the *general* controversy about progress. It is general in the sense that every author we studied who has anything significant to say about the subject takes sides on the various issues that can be identified within it. But there is also a *special* controversy about progress, which is made up of issues that are joined only by progress authors—authors who assert that progress occurs. These issues have to do with the nature or properties of the progress that they all, *being progress authors*, assert is a fact of history. There are only three issues here, although the discussion of each of them is complex. They can be stated as questions: (1) Is progress necessary, or is it contingent on other occurrences? (2) Will progress continue indefinitely, or will it eventually come to an end or “plateau out”? (3) Is there progress in human nature as well as in human institutions—in the human animal itself, or merely in the external conditions of human life?

Finally, there is a set of subordinate issues, as we called them, again only among progress authors, about the *respects* in which progress occurs. We identified six areas in which progress is said by some authors to occur, although other writers deny its occurrence in one or more of these areas—although never in all (since they are by definition authors who assert the occurrence of some kind of progress). The six are:

(1) progress in knowledge, (2) technological progress, (3) economic progress, (4) political progress, (5) moral progress, and (6) progress in the fine arts. The discussion of the last point raises special problems, since in our opinion no author genuinely asserts that such aesthetic progress occurs, although a number of writers deny that progress occurs in this respect.

The structure of the analysis of progress just described exemplifies our effort to define the issues within the discussion of this subject and to analyze the discussion itself—in other words, to take the fourth and fifth steps in syntopical reading. And something like this must always be done by a syntopical reader, although of course he does not always have to write a long book reporting his researches.¹¹

The Syntopicon and How to Use It

If you read this chapter carefully, you will have noticed that, although we spent some time discussing it, we did not really solve what we called the paradox of syntopical reading. That paradox can be stated thus: Unless you know what books to read, you cannot read syntopically, but unless you can read syntopically, you do not know what to read. Another way to state it is in the form of what may be called the fundamental problem of syntopical reading, namely, that if you do not know where to start, you cannot read syntopically; and even if you have a rough idea of where to begin, the time required to find the relevant books and relevant passages in those books may exceed the time required to take all of the other steps combined.

Actually, of course, there is at least a theoretical resolution of the paradox and solution of the problem. Theoretically, you could know the major literature of our tradition so thoroughly that you had a working notion of where every idea is discussed in it. But if you are such a person, you need no help from anybody, and we cannot tell you anything you do not know about syntopical reading.

On the other hand, even if you did not have this knowledge yourself, you might be able to apply to someone else who did. But you should recognize that if you were able to apply to such a person, his advice might turn out to be almost as much a hindrance as a help. If the subject was one on which he had himself done special research, it would be hard for him merely to tell you the relevant passages to read without telling you *how to read them*—and that might well get in your way. But if he had not done special research on the subject, he might not know a great deal more than yourself, although it might seem so both to him and to you.

What is needed, therefore, is a reference book that tells you where to go to find the relevant passages on a large number of subjects of interest, without at the same time saying how the passages should be read—without prejudging their meaning or significance. The Syntopicon is an example of such a work. Produced in the 1940s, it is a topical index to the set of books titled *Great Books of the Western World*. Under each of some 3,000 topics or subjects, it lists references to pages within the set where that subject is discussed. Some of the references are to passages covering many pages, others are to key paragraphs or even parts of paragraphs. No more time is required to find them than is needed to take down the indicated volume and flip through its pages.

The Syntopicon has one major defect, of course. It is an index of just one set of books (albeit a large one), and it gives only a very rough indication of where passages may be found in other books that are not included in the set. Nevertheless, it always provides you with at least a place to start on any syntopical reading project. And it is also true that the books included in the set are ones that you would almost always want to read anyway, in the course of any such project. Thus the Syntopicon should be able to save the mature scholar or reader who is beginning his research into a certain problem much of the preliminary labor of research, and advance him rapidly to the point where he can begin to think independently about it, because he knows what thinking has been done.

Useful as the Syntopicon is for that kind of reader, it is much more useful for the beginner. The Syntopicon can help such a reader in three ways: *initiatively*, *suggestively*, and *instructively*.

It works *initiatively* by overcoming the initial difficulty that anyone faces when confronted by the classical books of our tradition. These works are a little overpowering. We may wish that we had read them, but often we do not do so. We find ourselves advised from all sides to read them, and we are given reading programs, beginning with the easier works and proceeding to the more difficult ones. But all such programs require the reading of whole books or, at least, the integral reading of large parts of them. It is a matter of general experience that this kind of solution seldom achieves the desired result.

A syntopical reading of these major works with the aid of the Syntopicon provides a radically different solution. The Syntopicon initiates the reading of great books by enabling persons to read particular ones on the subjects in which they are interested; and on those subjects, to read relatively short passages from a large number of authors. It helps us to read *in* the great books before we have read *through* them.

Syntopical reading in the great books, with the help of the Syntopicon, may also work *suggestively*. Starting from the reader's existing interest in a particular subject, it may arouse or create other interests in related subjects. And once started on an author, it is hard not to explore the context. Before you know it, you have read a good portion of the book.

Finally, syntopical reading with the aid of the Syntopicon works *instructively*, in three distinct ways. This, in fact, is one of the major benefits of this level of reading.

***First*, the topic in connection with which the passage is being read serves to give direction to the reader in interpreting the passage. But it does not tell him what the passage means, since the passage may be relevant to the topic in several or many different ways. Hence the reader is called upon to *discover precisely what relevance the passage has to the topic*. To learn to do this is to acquire a major skill in the art of reading.**

***Second*, the collection of a number of passages on the same topic, but from different works and different authors, serves to *sharpen the reader's interpretation of each passage read*. Sometimes, when passages from the same book are read in sequence and in the context of one another, each becomes clearer. Sometimes the meaning of each of a series of contrasting or conflicting passages from different books is accentuated when they are read against one another. And sometimes the passages from one author, by amplifying or commenting on the passages from another, materially help the reader's understanding of the second author.**

***Third*, if syntopical reading is done on a number of different subjects, the fact that the same passage will often be found cited in the Syntopicon under two or more subjects will have its instructive effect. The passage has an amplitude of**

meaning that the reader will come to perceive as he interprets it somewhat differently in relation to different topics. Such multiple interpretation not only is a basic exercise in the art of reading but also tends to make the mind habitually alert to the many strains of meaning that any rich or complex passage can contain.

Because we believe that the Syntopicon can be useful to any reader wishing to read in the manner described in this chapter, be he a beginner or a mature scholar and researcher, we have taken the liberty of adopting its name for this level of reading. We hope the reader will forgive us what may seem to be a small self-indulgence. In return for that forgiveness, we would like to point out an important fact. There is a considerable difference between syntopical reading, with a small “s,” and Syntopical reading, where the latter phrase refers to reading the great books with the help of the Syntopicon. Syntopical reading, in the latter sense, can constitute a *part* of any syntopical reading project where the term is used in the former sense, and perhaps it would always be wise to start there. But syntopical reading with a small “s” is a term of much wider application than Syntopical reading.

On the Principles That Underlie Syntopical Reading

There are those who say that syntopical reading (in the broader sense just mentioned) is impossible. It is wrong, they say, to impose a terminology, even a “neutral” one (if there is any such thing), on an author. His own terminology must be treated as sacrosanct, because books should never be read “out of context,” and besides, translation from one set of terms to another is always dangerous because words are not controllable like mathematical symbols. Further, the objectors maintain, syntopical reading involves reading authors widely separated in space and time, and differing radically in style and approach, as if they were members of the same universe of discourse, as if they were talking to one another—and this distorts the facts of the matter. Each author is a little universe in himself, and although connections can be made between different books written by the same author at different times (even here there are dangers, they warn), there are no clear connections relating one author to another. They maintain, finally, that the *subjects* that authors discuss, as such, are not as important as the *ways* in which they discuss them. The style, they say, is the man; and if we ignore *how* an author says something, in the process of trying to discover *what* he says, we will miss both kinds of understanding.

It should be apparent that we disagree with all of those charges, and therefore an answer to each of them is in order. Let us take them one at a time.

First, to the point about *terminology*. To deny that an idea can be expressed in more than one set of terms is similar to denying that translation is possible from one natural language to another. That denial is made, of course. Recently, for example, we read an introduction to a new translation of the Koran that began by saying that to translate the Koran is impossible. But since the author then proceeded to explain how he had done it, we could only assume that he meant that translation is particularly difficult in the case of a

book held to be holy by large numbers of people. We would agree. But the difficult is not the impossible.

In fact, the view that an author's terms must be treated as sacrosanct is probably always merely another way of saying that it is difficult to translate from one terminology to another. We would agree to that, too. But again, the difficult is not the impossible.

Second, to the point about *the separateness and uniqueness of authors*. This comes down to saying that if Aristotle, for example, walked into our office, attired no doubt in robes and accompanied by an interpreter who knew both modern English and classical Greek, we would not be able to understand him or he us. We simply do not believe it. Doubtless Aristotle would be amazed at some of the things he saw, but we are quite confident that within ten minutes we could, if we wanted to, be engaged in a philosophical discussion of problems that we shared. There might be recurrent difficulties about certain conceptions, but as soon as we recognized them as such, we could resolve them.

If that is possible (and we do not really think anyone would deny it), then it is not impossible for one book to "talk" to another through the medium of an interpreter—namely, you, the syntopical reader. Care is required, of course, and you should know both "languages"—that is, both books—as well as you can. But the problem is not insuperable, and it is simply foolish to suggest that it is.

Finally, to the point about the *manner or style*. This is equivalent, we think, to saying that there is no rational communication among men, but that all men communicate at the emotional level, which is the same level at which they communicate with pets. If you say "I love you" to your dog in an angry tone of voice, he will cower; but he does not understand you. Can anyone seriously assert that there is *nothing more* than tone of voice or gesture in vocal communications between two human beings? Tone of voice is important, particularly when emotional relations are the primary content of the communication; and body language probably has things to tell us if we will only listen (look?). But there is something else, too, in human communication. If you ask someone how to reach the exit, and he tells you to follow Corridor B, it does not matter what tone of voice he employs. He is either right or wrong, lying or telling the truth, but the point is that you will soon find that out by following Corridor B. You have understood *what* he said as well as reacting, no doubt in all sorts of ways, to *how* he said it.

Believing, then, that translation is possible (because it is done all the time), that books can "talk" to one another (because human beings do so), and that there is an objective, rational content of communication between human beings when they are trying to be rational (because we can and do learn from each other), we believe that syntopical reading is possible.

Summary of Syntopical Reading

We have now completed our discussion of syntopical reading. Let us therefore display the various steps that must be taken at this level of reading in outline form.

As we have seen, there are two main stages of syntopical reading. One is preparatory, and the other is syntopical reading proper. Let us write out all of these steps for review.

I. SURVEYING THE FIELD PREPARATORY TO SYNTOPICAL READING

1. Create a tentative bibliography of your subject by recourse to library catalogues, advisors, and bibliographies in books.

2. Inspect *all* of the books on the tentative bibliography to ascertain which are germane to your subject, and also to acquire a clearer idea of the subject.

Note: These two steps are not, strictly speaking, chronologically distinct; that is, the two steps have an effect on each other, with the second, in particular, serving to modify the first.

II. Use Rules of Reading by reading by reading the various text. SYNTOPICAL READING OF THE BIBLIOGRAPHY AMASSED IN STAGE I

1. Inspect the books already identified as relevant to your subject in Stage I in order to find the most relevant passages.

2. Use Rules of Reading by reading the various text. Bring the authors to terms by constructing a neutral terminology of the subject that all, or the great majority, of the authors can be interpreted as employing, whether they actually employ the words or not.

3. Use Rules of Reading by reading the various text. Establish a set of neutral propositions for all of the authors by framing a set of questions to which all or most of the authors can be interpreted as giving answers, whether they actually treat the questions explicitly or not.

4. Use Rules of Reading by reading the various text. Define the issues, both major and minor ones, by ranging the opposing answers of authors to the various questions on one side of an issue or another. You should remember that an issue does not always exist explicitly between or among authors, but that it sometimes has to be constructed by interpretation of the authors' views on matters that may not have been their primary concern.

5. Use Rules of Reading by reading the various text. Analyze the discussion by ordering the questions and issues in such a way as to throw maximum light on the subject. More general issues should precede less general ones, and relations among issues should be clearly indicated.

Note: Dialectical detachment or objectivity should, ideally, be maintained throughout. One way to insure this is always to accompany an interpretation of an author's views on an issue with an actual quotation from his text.

Reading and the Growth of the Mind

We have now completed the task that lay before us at the beginning of this book. We have shown that activity is the essence of good reading, and that the more active reading is, the better it is.

We have defined active reading as the asking of questions, and we have indicated what questions must be asked of any book, and how those questions must be answered in different ways for different kinds of books.

We have identified and discussed the four levels of reading, and shown how these are cumulative, earlier or lower levels being contained in later or higher ones. Consequent upon our stated intention, we have laid more stress upon the later and higher levels of reading than upon the earlier and lower ones, and we have therefore emphasized analytical and syntopical reading. Since analytical reading is probably the most unfamiliar kind for most readers, we have discussed it at greater length than any of the other levels, giving its rules and explaining them in the order in which they must be applied. But almost everything that was said of analytical reading also applies, with certain adaptations that were mentioned in the last chapter, to syntopical reading as well.

We have completed our task, but you may not have completed yours. We do not need to remind you that this is a practical book, nor that the reader of a practical book has a special obligation with respect to it. If, we said, the reader of a practical book accepts the ends it proposes and agrees that the means recommended are appropriate and effective, then he must act in the way proposed. You may not accept the primary aim we have endorsed—namely, that you should be able to read as well as possible—nor the means we have proposed to reach it—namely, the rules of inspectional, analytical, and syntopical reading. (In that case, however, you are not likely to be reading this page.) But if you do accept that aim and agree that the means are appropriate, then you must make the effort to read as you probably have never read before.

That is your task and your obligation. Can we help you in it in any way?

We think we can. The task falls mainly on you—it is you who, henceforth, must do all the work (and obtain all the benefits). But there are several things that remain to be said, about the end and the means. Let us discuss the latter first.

What Good Books Can Do for Us

“Means” can be interpreted in two ways. In the previous paragraph, we interpreted the term as referring to the rules of reading, that is, the *method* by which you become a better reader. But “means” can also be interpreted as referring to *the things you read*. Having a method without materials to which it can be applied is as useless as having the materials with no method to apply to them.

In the latter sense of the term, the means that will serve you in the further improvement of your reading are the books you will read. We have said that the method

applies to anything you read, and that is true, if you understand by the statement any *kind* of book—whether fiction or nonfiction, imaginative or expository, practical or theoretical. But in fact, the method, at least as it is exemplified in our discussion of analytical and syntopical reading, *does not apply to every book*. The reason is that some books do not require it.

We have made this point before, but we want to make it now again because of its relevance to the task that lies before you. *If you are reading in order to become a better reader, you cannot read just any book or article*. You will not improve as a reader if all you read are books that are well within your capacity. You must tackle books that are beyond you, or, as we have said, books that are over your head. Only books of that sort will make you stretch your mind. And unless you stretch, you will not learn.

Thus, it becomes of crucial importance for you not only to be able to read well but also to be able to identify those books that make the kinds of demands on you that improvement in reading ability requires. A book that can do no more than amuse or entertain you may be a pleasant diversion for an idle hour, but you must not expect to get anything but amusement from it. We are not against amusement in its own right, but we do want to stress that *improvement in reading skill does not accompany it*. The same goes for a book that merely informs you of facts that you did not know without adding to your understanding of those facts. Reading for information does not stretch your mind any more than reading for amusement. It may seem as though it does, but that is merely because your mind is fuller of facts than it was before you read the book. However, your mind is essentially in the same condition that it was before. There has been a quantitative change, but no improvement in your skill.

We have said many times that the good reader makes demands on himself when he reads. He reads actively, effortfully. Now we are saying something else. The books that you will want to practice your reading on, particularly your analytical reading, *must also make demands on you*. They must seem to you to be beyond your capacity. You need not fear that they really are, because there is no book that is completely out of your grasp if you apply the rules of reading to it that we have described. This does not mean, of course, that these rules will accomplish immediate miracles for you. There are certainly some books that will continue to extend you no matter how good a reader you are. Actually, those are the very books that you must seek out, because they are the ones that can best help you to become an ever more skillful reader.

Some readers make the mistake of supposing that such books—the ones that provide a constant and never-ending challenge to their skill—are always ones in relatively unfamiliar fields. In practice, this comes down to believing, in the case of most readers, that only scientific books, and perhaps philosophical ones, satisfy the criterion. But that is far from the case. We have already remarked that the great scientific books are in many ways easier to read than non-scientific ones, because of the care with which scientific authors help you to come to terms, identify the key propositions, and state the main arguments. These helps are absent from poetical works, and so in the long run they are quite likely to be the hardest, the most demanding, books that you can read. Homer, for

example, is in many ways harder to read than Newton, despite the fact that you may get more out of Homer the first time through. The reason is that Homer deals with subjects that are harder to write well about.

The difficulties that we are talking about here are very different from the difficulties that are presented by a bad book. It is hard to read a bad book, too, for it defies your efforts to analyze it, slipping through your fingers whenever you think you have it pinned down. In fact, in the case of a bad book, there is really nothing *to* pin down. It is not worth the effort of trying. You receive no reward for your struggle.

A good book does reward you for trying to read it. The best books reward you most of all. The reward, of course, is of two kinds. First, there is the improvement in your reading skill that occurs when you successfully tackle a good, difficult work. Second—and this in the long run is much more important—a good book can teach you about the world and about yourself. You learn more than how to read better; you also learn more about life. You become wiser. Not just more knowledgeable—books that provide nothing but information can produce that result. But wiser, in the sense that you are more deeply aware of the great and enduring truths of human life.

There are some human problems, after all, that have no solution. There are some relationships, both among human beings and between human beings and the nonhuman world, about which no one can have the last word. This is true not only in such fields as science and philosophy, where it is obvious that final understanding about nature and its laws, and about being and becoming, has not been achieved by anyone and never will be; it is also true of such familiar and everyday matters as the relation between men and women, or parents and children, or man and God. These are matters about which you cannot think too much, or too well. The greatest books can help you to think better about them, because they were written by men and women who thought better than other people about them.

The Pyramid of Books

The great majority of the several million books that have been written in the Western tradition alone—more than 99 per cent of them—will not make sufficient demands on you for you to improve your skill in reading. This may seem like a distressing fact, and the percentages may seem an overestimate. But obviously, considering the numbers involved, it is true. These are the books that can be read only for amusement or information. The amusement may be of many kinds, and the information may be interesting in all sorts of ways. But you should not expect to learn anything of importance from them. In fact, you do not have to read them—analytically—at all. Skimming will do.

There is a second class of books from which you can learn—both how to read and how to live. Less than one out of every hundred books belongs in this class—probably it is more like one in a thousand, or even one in ten thousand. These are the good books, the ones that were carefully wrought by their authors, the ones that convey to the reader

significant insights about subjects of enduring interest to human beings. There are in all probably no more than a few thousand such books. They make severe demands on the reader. They are worth reading analytically—once. If you are skillful, you will be able to get everything out of them that they can give in the course of one good reading. They are books that you read once and then put away on your shelf. You know that you will never have to read them again, although you may return to them to check certain points or to refresh your memory of certain ideas or episodes. (It is in the case of such books that the notes you make in the margin or elsewhere in the volume are particularly valuable.)

How do you know that you do not ever have to read such books again? You know it by your own mental reaction to the experience of reading them. Such a book stretches your mind and increases your understanding. But as your mind stretches and your understanding increases, you realize, by a process that is more or less mysterious, that you are not going to be changed any more in the future by this book. You realize that you have grasped the book in its entirety. You have milked it dry. You are grateful to it for what it has given you, but you know it has no more to give.

Of the few thousand such books there is a much smaller number—here the number is probably less than a hundred—that cannot be exhausted by even the very best reading you can manage. How do you recognize this? Again it is rather mysterious, but when you have closed the book after reading it analytically to the best of your ability, and place it back on the shelf, you have a sneaking suspicion that there is more there than you got. We say “suspicion” because that may be all it is at this stage. If you knew what it was that you had missed, your obligation as an analytical reader would take you back to the book immediately to seek it out. In fact, you cannot put your finger on it, but you know it is there. You find that you cannot forget the book, that you keep thinking about it and your reaction to it. Finally, you return to it. And then a very remarkable thing happens.

If the book belongs to the second class of books to which we referred before, you find, on returning to it, that there was *less there than you remembered*. The reason, of course, is that you yourself have grown in the meantime. Your mind is fuller, your understanding greater. The book has not changed, but you have. Such a return is inevitably disappointing.

But if the book belongs to the highest class—the very small number of inexhaustible books—you discover on returning that *the book seems to have grown with you*. You see new things in it—whole sets of new things—that you did not see before. Your previous understanding of the book is not invalidated (assuming that you read it well the first time); it is just as true as it ever was, and in the same ways that it was true before. But now it is true in still other ways, too.

How can a book grow as you grow? It is impossible, of course; a book, once it is written and published, does not change. But what you only now begin to realize is that the book was so far above you to begin with that it has remained above you, and probably always will remain so. Since it is a really good book—a great book, as we might say—it is accessible at different levels. Your impression of increased understanding on your

previous reading was not false. The book truly lifted you then. But now, even though you have become wiser and more knowledgeable, it can lift you again. And it will go on doing this until you die.

There are obviously not many books that can do this for any of us. Our estimate was that the number is considerably less than a hundred. But the number is *even less than that for any given reader*. Human beings differ in many ways other than in the power of their minds. They have different tastes; different things appeal more to one person than to another. You may never feel about Newton the way you feel about Shakespeare, either because you may be able to read Newton so well that you do not have to read him again, or because mathematical systems of the world just do not have all that appeal to you. Or, if they do—Charles Darwin is an example of such a person—then Newton may be one of the handful of books that are great for you, and not Shakespeare.

We do not want to state authoritatively that any particular book or group of books must be great for you, in this sense, although in our first Appendix we do list those books that experience has shown are capable of having this kind of value for many readers. Our point, instead, is that *you should seek out the few books that can have this value for you*. They are the books that will teach you the most, both about reading and about life. They are the books to which you will want to return over and over. They are the books that will help you to grow.

The Life and Growth of the Mind

There is an old test—it was quite popular a generation ago—that was designed to tell you which books are the ones that can do this for you. Suppose, the test went, that you know in advance that you will be marooned on a desert island for the rest of your life, or at least for a long period. Suppose, too, that you have time to prepare for the experience. There are certain practical and useful articles that you would be sure to take with you. You will also be allowed ten books. Which ones would you select?

Trying to decide on a list is instructive, and not only because it may help you to identify the books that you would most like to read and reread. That, in fact, is probably of minor importance, compared with what you can learn about yourself when you imagine what life would be like if you were cut off from all the sources of amusement, information, and understanding that ordinarily surround you. Remember, there would be no radio or television on the island, and no lending library. There would be just you and ten books.

This imagined situation seems bizarre and unreal when you begin to think about it. But is it actually so unreal? We do not think so. We are all to some extent persons marooned on a desert island. We all face the same challenge that we would face if we really were there—the challenge of finding the resources within ourselves to live a good human life.

There is a strange fact about the human mind, a fact that differentiates the mind sharply from the body. The body is limited in ways that the mind is not. One sign of this is that the body does not continue indefinitely to grow in strength and develop in skill and

grace. By the time most people are thirty years old, their bodies are as good as they will ever be; in fact, many persons' bodies have begun to deteriorate by that time. *But there is no limit to the amount of growth and development that the mind can sustain.* The mind does not stop growing at any particular age; only when the brain itself loses its vigor, in senescence, does the mind lose its power to increase in skill and understanding.

This is one of the most remarkable things about human beings, and it may actually be the major difference between *Homo sapiens* and the others animals, which do not seem to grow mentally beyond a certain stage in their development. But this great advantage that man possesses carries with it a great peril. *The mind can atrophy*, like the muscles, *if it is not used*. Atrophy of the mental muscles is the penalty that we pay for not taking mental exercise. And this is a terrible penalty, for there is evidence that atrophy of the mind is a mortal disease. There seems to be no other explanation for the fact that so many busy people die so soon after retirement. They were kept alive by the demands of their work upon their minds; they were propped up artificially, as it were, by external forces. But as soon as those demands cease, having no resources within themselves in the way of mental activity, they cease thinking altogether, and expire.

Television, radio, and all the sources of amusement and information that surround us in our daily lives are also artificial props. They can give us the impression that our minds are active, because we are required to react to stimuli from outside. But the power of those external stimuli to keep us going is limited. They are like drugs. We grow used to them, and we continuously need more and more of them. Eventually, they have little or no effect. Then, if we lack resources within ourselves, we cease to grow intellectually, morally, and spiritually. And when we cease to grow, we begin to die.

Reading well, which means reading actively, is thus not only a good in itself, nor is it merely a means to advancement in our work or career. It also serves to keep our minds alive and growing.

Deep Work and Research

Method 24 - The Craft of Research

Part I

Research, Researchers, and Readers

1.1 WHAT IS RESEARCH?

In the broadest terms, we do research whenever we gather information to answer a question that solves a problem:

PROBLEM: Where do I find a new head gasket for my '65 Mustang?

RESEARCH: Look in the yellow pages for an auto-parts store, then call to see if it has one in stock.

PROBLEM: To settle a bet, I need to know when Michael Jordan was born.

RESEARCH: You Google "Michael Jordan birthday."

PROBLEM: I'm just curious about a new species of fish.

RESEARCH: You search the Internet for articles in newspapers and academic journals.

We all do that kind of research every day, and though we rarely write it up, we rely on those who wrote up theirs: Jordan's biographers, the fish discoverers, the publishers of the yellow pages and the catalogs of the auto-parts suppliers—they all wrote up their research because they knew that one day someone would have a question that they could answer.

If you're preparing to do a research project not because you want to but because it's been assigned, you might think that it is just make-work and treat it as an empty exercise. We hope you won't. Done well, your project prepares you to join the oldest and most esteemed of human conversations, one conducted for millennia among philosophers, engineers, biologists, social scientists, historians, literary critics, linguists, theologians, not to mention CEOs, lawyers, marketers, investment managers—the list is endless.

Right now, if you are a beginner, you may feel that the conversation is one-sided, that you have to listen more than you can speak because you have little to contribute. If you are a student, you may feel that you have only one reader: your teacher. All that may be

true, for the moment. But at some point, you will join a conversation that, at its best, can help you and your community free us from ignorance, prejudice, and the half-baked ideas that so many charlatans try to impose on us. It is no exaggeration to say that, maybe not today or tomorrow but one day, the research you do and the arguments you make using it can improve if not the whole world, then at least your corner of it.

1.2 WHY WRITE IT UP?

For some of you, though, the invitation to join this conversation may still seem easy to decline. If you accept it, you'll have to find a good question, search for sound data, formulate and support a good answer, and then write it all up. Even if you turn out a first-rate paper, it may be read not by an eager world but only by your teacher. *And, besides, you may think, my teacher knows all about my topic. What do I gain from writing up my research, other than proving I can do it?* One answer is that we write not just to share our work, but to improve it before we do.

1.2.1 Write to Remember

Experienced researchers first write just to remember what they've read. A few talented people can hold in mind masses of information, but most of us get lost when we think about what Smith found in light of Wong's position, and compare both to the odd data in Brunelli, especially as they are supported by Boskowitz—*but what was it that Smith said?* When you don't take notes on what you read, you're likely to forget or, worse, misremember it.

1.2.2 Write to Understand

A second reason for writing is to see larger patterns in what you read. When you arrange and rearrange the results of your research in new ways, you discover new implications, connections, and complications. Even if you could hold it all in mind, you would need help to line up arguments that pull in different directions, plot out complicated relationships, sort out disagreements among experts. *I want to use these claims from Wong, but her argument is undercut by Smith's data. When I put them side by side, I see that Smith ignores this last part of Wong's argument. Aha! If I introduce it with this part from Brunelli, I can focus on Wong more clearly.* That's why careful researchers never put off writing until

they've gathered all the data they need: they write from the start of their projects to help them assemble their information in new ways.

1.2.3 Write to Test Your Thinking

A third reason to write is to get your thoughts out of your head and onto paper, where you'll see what you really *can* think. Just about all of us, students and professionals alike, believe our ideas are more compelling in the dark of our minds than they turn out to be in the cold light of print. You can't know how good your ideas are until you separate them from the swift and muddy flow of thought and fix them in an organized form that you—and your readers—can study. In short, we write to remember more accurately, understand better, and evaluate what we think more objectively. (And as you will discover, the more you write, the better you read.)

1.3 WHY A FORMAL PAPER?

But even when they agree that writing is an important part of learning, thinking, and understanding, some still wonder why they can't write up their research in their own way, why they have to satisfy demands imposed by a community that they have not joined (or even want to) and conform to conventions they did nothing to create. *Why should I adopt language and forms that are not mine? Aren't you just trying to turn me into an academic like yourself? If I write as you expect me to, I risk losing my identity.*

Such concerns are legitimate (most teachers wish students would raise them more often). But it would be a feeble education that did not change you at all, and the deeper your education, the more it will change the “you” that you are or want to be. That's why it is so important to choose carefully what you study and with whom. But it would be a mistake to think that learning to report sound research must threaten your true identity. It will change the way you think, but only by giving you more ways of thinking. You will be different by being freer to choose whom you want to be and what you want to do with your life.

But the most important reason for learning to write in ways readers expect is that when you write for others, you demand more of yourself than when you write for yourself alone. By the time you fix your ideas in writing, they are so familiar to you that you need help to see them not for what you want them to be but for what they really are. You will understand your own work better when you try to anticipate your readers' inevitable and critical

questions: *How have you evaluated your evidence? Why do you think it's relevant? What ideas have you considered but rejected?*

All researchers, including us, can recall moments when in writing to meet their readers' expectations, they found a flaw or blunder in their thinking or even discovered a new insight that escaped them in a first draft written for themselves. You can do that only once you imagine and then meet the needs and expectations of informed and careful readers. When you do that, you create what we call a *rhetorical community* of shared values.

You might think, *OK, I'll write for readers, but why not in my own way?* The traditional forms that readers expect are more than just empty vessels into which you must pour your ideas. They also help writers think and communicate in ways they might not otherwise, and they embody the shared values of a research community. Whatever community you join, you'll be expected to show that you understand its practices by presenting your research in the standard forms, or *genres*, that a community uses to represent *what* it knows and *how* it knows. The various genres of research-based writing—the research paper, the scholarly article, the research report, the conference paper, the legal brief, and a great many others—have evolved to meet the needs of the communities that use them. Relatively stable, they allow both newcomers and longtime members of a community to come together through shared practices and expectations. Once you know the genres that belong to and define your particular research community, you'll be better able to answer your community's predictable questions and understand what its members care about and why. As you learn to write the genres of a field or profession, you become a member of that research community.

But as different as research communities are, what counts as good work is the same, whether it's in the academic world or the world of government, commerce, or technology. If you learn to do research well now, you gain an immense advantage in the kind of research you will do later, no matter where you do it.

1.4 WRITING IS THINKING

Writing up your research is, finally, thinking with and for your readers. When you write for others, you disentangle your ideas from your memories and wishes, so that you—and others—can explore, expand, combine, and understand them more fully. Thinking for

others is more careful, more sustained, more insightful—in short, more thoughtful—than just about any other kind of thinking.

You can, of course, take the easy way: do just enough to satisfy your teacher. This book will help you do that, but you'll shortchange yourself if that's all you do. If instead you find a topic that *you* care about, ask a question that *you* want to answer, then pursue that answer as best you can, your project can have the fascination of a mystery whose solution richly rewards your efforts. Nothing contributes more to successful research than your commitment to it, and nothing teaches you more about how to think than making a successful (or even unsuccessful) argument using it.

Some of the world's most important research has been done by those who persevered in the face of indifference or even hostility, because they never lost faith in their vision. The geneticist Barbara McClintock struggled for years unappreciated because her research community considered her work uninteresting. But she believed in it and pressed on. When her colleagues finally realized that she had already answered questions that they were just starting to ask, she won science's highest honor, the Nobel Prize.

We wish we could tell you how to balance your belief in the worth of your project with the need to accommodate the demands of teachers and colleagues, but we cannot. If you believe in what you're doing and cannot find anyone else who shares your beliefs, all you can do is put your head down and press on. With our admiration.

2 Connecting with Your Reader

Creating a Role for Yourself and Your Readers

Research counts for little if few read it. Yet even experienced researchers sometimes forget to keep their readers in mind as they plan and draft. In this chapter, we show you how to think about readers even before you begin your project.

Most of the important things we do, we do with others. Some students think research is different. They imagine the lone scholar in a hushed library. But no place is more filled with imagined voices than a library or lab. The view of research you see walking by these sites is only part of the story. When you read a book or a scientific paper, you silently converse with its writers—and through them with everyone else they have read. In fact, every time you go to a written source for information, you join a conversation between writers and readers that began more than five thousand years ago. And when you report your own research, you add your voice and can hope that other voices will respond to you, so that you can in turn respond to them. So it goes and, we hope, will continue for a long time to come.

2.1 CONVERSING WITH YOUR READERS

Conversations are social activities in which we are expected to play our parts. Face-to-face, we can judge how well we and others do that by sensing how a conversation is going. Do we treat each other as equals, speaking and listening civilly, answering each other's questions directly? Or does one of us seem to be playing the role of expert, assigning others the role of audience? We can judge how well a conversation is going as we have it, and we can adjust our roles and behavior to repair mistakes and misunderstandings as they occur. But writing is an *imagined* conversation. Once we decide what role to play and what role to assign our readers, those roles are fixed. If as we read we think, *Well, Abrams acknowledges Stanik's evidence, but he's dogmatic in criticizing it and ignores obvious counterexamples*, Abrams can't change what we read next to recover from our judgment.

Of course, judgments go both ways: just as readers judge writers, so writers also judge readers, but they do so before they write. Consider these two sentences:

Interruption of REM sleep has been shown not only to inhibit memory consolidation, especially for declarative memories, but also to significantly impair cognitive processes dependent on working memory function.

If you don't get enough sleep, not only will you struggle to retain facts and concepts, but your working memory function will also be impaired, making it difficult for you to hold information in mind and consequently to understand, think, and learn.

Both writers make judgments about their readers' needs and goals. The first addresses herself to knowledgeable colleagues interested in learning about the psychology of sleep and memory. She therefore focuses on abstract concepts and freely uses technical terms. The second presents himself as an expert patiently explaining a complicated matter to readers who know little about it, and so he largely avoids technical vocabulary. He also assumes that his readers want practical advice, and so he addresses them directly as "you" and shows them what his information means to them.

The two sentences are very different: the first reads like an excerpt from an advanced textbook; the second, like it comes from a guide on good study habits. But both would be effective if their writers judged their readers correctly.

But suppose the writers switched passages. Readers ignorant of cognitive psychology looking for practical advice would think that the writer of the first was indifferent to their needs; readers knowledgeable about sleep and memory would think that the writer of the second was talking down to them. When writers misjudge their readers in this way, they risk losing them.

In fact, writers can't avoid creating *some* role for themselves and their readers, planned or not. So those roles are worth thinking about from the beginning, before you write a word. If you ignore or miscast your readers, you'll leave so many traces of that mistake in your early drafts that you won't easily fix them in the final one.

In writing this book, we tried to imagine you—what you're like, what you know about research, whether you even care about it. We imagined a *persona* for you, a role we hoped you would adopt: someone who is interested in learning how to do and report research and who shares our belief in its importance (or at least is open to being persuaded). Then we imagined a persona of our own: writers committed to the value of research, interested in sharing how it works, talking not *at* you like a lecturer or *down* to

you like a pedant, but *with* the “you” we hoped you want to become. We tried to speak as easily to those of you starting your first project as to those of you doing advanced work. We hoped that new researchers would not be frustrated when we discussed issues they haven’t yet faced and that more experienced readers would be patient as we covered familiar ground. Only you can judge how well we’ve succeeded.

2.2 UNDERSTANDING YOUR ROLE

Since few people read formal research papers for entertainment, you have to create a relationship that encourages them to see why it’s in their interest to read yours. That’s not easy. Too many beginning researchers offer readers a relationship that caricatures a bad classroom: *Teacher, I know less than you. So my role is to show you how many facts I can dig up. Yours is to say whether I’ve found enough to give me a good grade.* Do that and you turn your project into a pointless drill that demeans both you and your teacher. Worse, you cast yourself in a role exactly opposite to that of a true researcher.

In true research, you must switch the roles of student and teacher. When you do research, you learn something that others don’t know. So when you report it, you must think of your reader as someone who doesn’t know it *but needs to* and yourself as someone who will *give her reason to want to know it*. You must imagine a relationship that goes beyond *Here are some facts I’ve dug up about fourteenth-century Tibetan weaving. Are they enough of the right ones?* There are three better reasons for offering those facts; the third is most common in academic research.

2.2.1 I’ve Found Some New and Interesting Information

You take the first step toward true research when you say to your reader, *Here are some facts about fourteenth-century Tibetan weaving that you do not know and may find interesting.* This offer assumes, of course, that your reader wants to know. But even if not, you must still cast yourself in the role of someone who has found something your reader will find interesting and your reader as someone who wants to know, *whether she really will or not*. Down the road, you’ll be expected to find (or create) a community of readers who not only share an interest in your topic (or can be convinced to), but also have questions about it that you can answer. But even if you don’t have that audience right now, you must write as if you do. You must present yourself as interested in, even enthusiastic about, wanting to share something new, because the interest you show in your work roughly predicts the interest your reader will take in it.

2.2.2 I've Found a Solution to an Important Practical Problem

You take a step toward more significant research when you can say to readers not just *Here are some facts that should interest you*, but *These facts will help you do something to solve a problem you care about*. That is the kind of research that people do every day in business, government, and the professions. They confront practical problems whose solutions require research into the facts of the matter, first to understand the problem, then to figure out how to solve it—problems ranging from insomnia to falling profits to terrorism.

To help new researchers learn that role, teachers sometimes invent “real world” scenarios: an environmental science professor might assign you to write a report for the director of the state Environmental Protection Agency on how to clean up a local lake. In this scenario you are playing the role not of a student delivering data to a teacher, but of a professional giving practical advice to someone who needs it. To make your report credible, however, you must use the right terminology, cite the right sources, find and present the right evidence, all in the right format. But most important, you have to design your report around a specific *intention* that defines your role: to advise a decision maker on what to *do* to solve a problem. That kind of research is typical in the world at large but is less common in academic research than the next one.

2.2.3 I've Found an Answer to an Important Question

Although academic researchers sometimes advise EPA directors on what to do, their more common role is that of scholars who help their research community simply understand something better. Others might use their findings to solve a practical problem—a discovery about the distribution of prime numbers, for example, helped cryptologists design an unbreakable code. But that research itself was aimed at solving not the *practical* problem of keeping secrets, but the *conceptual* problem of not entirely understanding prime numbers. Some researchers call this kind of research “pure” as opposed to “applied.”

Teachers occasionally invent “real world” scenarios involving conceptual problems: a political science professor asks you to play the role of a senator’s intern researching the voting habits of out-of-state college students. But more

typically they expect you to imagine yourself as what you are learning to be: a researcher addressing a community of other researchers interested in issues that they want to understand better. Your report on fourteenth-century Tibetan weaving, for example, could

possibly help rug designers sell more rugs, but its main aim is to help scholars better understand something about Tibetan art, such as *How did fourteenth-century Tibetan rugs influence the art of modern China?*

2.3 IMAGINING YOUR READERS' ROLE

You establish your side of the relationship with your readers when you adopt one of those three roles—*I have information for you; I can help you fix a problem; I can help you understand something better*. You must, however, cast your readers in a complementary role by offering them a social contract: *I'll play my part if you play yours*. But that means you have to understand their role. If you cast them in a role they won't accept, you're likely to lose them entirely. In this case, the old advice to "consider your audience" means that you must report your research in a way that motivates your readers to play the role you have imagined for them.

For example, suppose you're an expert on blimps and zeppelins. You've been asked to share your research with three different groups with three different reasons for wanting to hear about it. How they receive you will depend on how accurately you imagine the role each intends to play and how well you match your role to theirs. For that, you must understand what they want and what they are in return willing *and able* to do for you.

2.3.1 Entertain Me

Imagine the first group that invited you to speak is the local Zeppelin Club. Its members are not experts, but they know a lot about zeppelins. They read about them, visit historic sites, and collect zeppelin memorabilia. You decide to share some new facts you've found in a letter from your Great-Uncle Otto describing his transatlantic zeppelin flight in 1936, along with some photographs and a menu he saved. His letter comments on the grilled oysters he had for dinner and tells a funny story about why he happened to take the trip in the first place.

In planning your talk, you judge that what's at stake is just a diverting hour of zeppelin trivia. You meet your side of the bargain when you share whatever you think might interest them—hunches, speculation, even unsubstantiated rumors. You won't show PowerPoint slides, present data, or cite scholarly sources to substantiate your claims. Your audience will play its role by listening with interest, asking questions, maybe sharing their own

anecdotes. You don't expect them to challenge the authenticity of the letter from Great-Uncle Otto or question how the photos are relevant to the social history of zeppelins, much less of lighter-than-air travel in general. Your job is to give an engaging talk; theirs is to be amiably engaged.

Some beginning researchers imagine their readers belong to a Zeppelin Club, already fascinated by their topic and eager to hear anything new about it. While that sometimes works for experts with the right audience (see the box on page 24), it rarely works for students learning to do and report serious research. Your teachers expect you to report not just *what* you find, but what you can *do* with it.

2.3.2 Help Me Solve My Practical Problem

Imagine that your next meeting is with True-to-Life Films. They plan to make a movie about a zeppelin flight in 1936 and want you to help them get the historical details right, including a scene in the dining cabin. They want to know how the cabin was furnished, what people ate, what the menus looked like, and so on. They don't care whether your facts are new, only whether they are right, so that they can make the scene authentic. You show them your photos and the menu and describe the oysters Great-Uncle Otto ate, but you don't bother with why he took the trip. To succeed in this role, you must help them solve a practical problem whose solution you base not on *all* the data you can find, no matter how new, but on just those *particular* facts that are relevant to the problem of authenticity and whose sources you can show are reliable. Your audience will listen intently and critically, because they want to get the details right.

That's the kind of task you're likely to face if your teacher invents a "real world" assignment—write to an EPA official who needs to *do* something about a polluted lake. Academic researchers sometimes address practical problems like these, but for them another kind of problem is far more common. So pose a practical problem *only if* your teacher creates one; otherwise, check with her first. (We'll discuss practical problems in more detail in [chapter 4](#).)

2.3.3 Help Me Understand Something Better

Now imagine that your audience is the faculty of Zeppo University's Department of Lighter-than-Air Studies. They study all aspects of blimps and zeppelins, do research on their economics and aerodynamics, and participate

in a worldwide conversation about their history and social significance. They compete with other lighter-than-air scholars to produce new lighter-than-air knowledge and theories that they publish in lighter-than-air journals and books read by everyone in their lighter-than-air field.

These scholars have invited you to talk about your specialty: the social history of zeppelin travel in the 1930s. They don't want you just to amuse them with new facts (though they'll be happy if you do) or to help them *do* something (though they'd be pleased if you got them consulting work with True-to-Life Films). They want you to use whatever new facts you have to help them better *understand* the social history of zeppelin travel or, better still, of lighter-than-air culture in general.

Because these lighter-than-air scholars are intensely committed to finding the Truth about zeppelins, you know they expect you to be objective, rigorously logical, and able to examine every issue from all sides. You also know that if you don't nail down your facts, they'll hammer you during the question period and if you don't have good answers, slice you up afterward over the wine and cheese, not just to be contentious or even nasty (though some will be), but to get as close as they can to the Truth about zeppelins in the 1930s. If you offer new data, like Great-Uncle Otto's photos, letter, and menu, they'll be glad to see them, but they'll want to know why they matter and might even question their authenticity.

Above all, they will care about your documents *only if* you can show how they serve as *evidence* that helps you answer a question important to understanding something about zeppelins that is *more important* than your uncle's trip. They will receive you especially well if you can convince them that they do not understand the social history of zeppelins as well as they thought and that your new data will improve their flawed understanding. If you can't do that, they'll respond not with *I don't agree*—we all learn to live with that; some of us even thrive on it—but with a response far more devastating: *I don't care*.

So you begin your talk:

We all have been led to believe by a number of studies on the food service on transatlantic zeppelin flights in the 1930s (especially Schmidt 1986 and Kloepper 1998) that items were never cooked over an open flame because of the danger of explosions. However, I have recently discovered a menu from

the July 12, 1936, crossing of the *Hindenburg* indicating that oysters grilled over charcoal were served. . . . [You then go on to show why that new knowledge matters.]

That is the kind of conversation you join when you report research to a community of scholars. You must imagine them imagining this conversation with you: *Never mind whether your style is graceful (though I will admire your work more if it is); don't bother me with amusing anecdotes about your Great-Uncle Otto (though I like hearing them if they help me understand your ideas better); ignore whether what you know will make me rich (though I would be happy if it did). Just tell me something I don't know so that I can better understand our common interest.*

Who Cares about *That*?

Academic researchers are often scoffed at for studying esoteric topics that matter to no one but themselves. The charge is usually unfair, but some researchers do become fascinated with matters that seem to have little significance. Williams once attended the dissertation defense of a PhD candidate who had discovered reels and reels of film shot by European anthropologists in Africa and Asia in the early twentieth century. This previously unknown footage fascinated the film scholars on the committee. But when Williams asked the candidate, "How do these new films improve our understanding of movies then or now?" she could answer only that "no one has ever seen this footage before." Williams put his question in different ways but never got a better answer. The film scholars, on the other hand, were untroubled (and found Williams's questions naive), because they were already imagining how the footage might change their thinking about early film. And in any event, they all loved old film for its own sake. So sometimes new data alone are enough to interest the right readers. But if that candidate hopes to write anything that interests anyone but a tiny coterie of specialists, she will have to make an offer better than *Here's some new stuff*.

Your academic readers will almost always adopt this third role. They will think you've fulfilled your side of the social contract only when you treat them as who they think they are: scholars interested in greater knowledge and better understanding. To be sure, the faculty over in chemistry or philosophy care little about zeppelins, much less their meal service. (*Can you believe the trivia they study over in Helium Hall?*) But then you don't much care about their issues, either. You are concerned with your *particular* community of readers, with *their* interests and expectations, with improving *their* understanding, based

on the best evidence you can find. That's the social contract that all researchers must establish with their readers.

Quick Tip: A Checklist for Understanding Your Readers

Think about your readers from the start, knowing that you'll understand them better as you work through your project. Answer these questions early on, then revisit them when you start planning and again when you revise.

Who will read my paper?

Professionals who expect me to follow every academic convention and use a standard format?

Well-informed general readers?

General readers who know little about the topic?

What do they expect me to do? Should I

entertain them?

provide new factual knowledge?

help them understand something better?

help them do something to solve a practical problem in the world?

How much can I expect them to know already?

What do they know about my topic?

Is the problem one that they already recognize?

Is it one that they have but haven't yet recognized?

Is the problem not theirs, but only mine?

Will they take the problem seriously, or must I convince them that it matters?

How will readers respond to the solution/answer in my main claim?

Will it contradict what they already believe? How?

Will they make standard arguments against my solution?

Will they want to see the steps that led me to the solution?

PART II

Asking Questions, Finding Answers

Prologue

Planning Your Project—An Overview

If you've skimmed this book once, you're ready to begin your project. If you have a research question and know how to look for its answer, review the next two chapters quickly; then read the remaining ones carefully as they become relevant to your task. You may, however, feel bewildered if you're starting from scratch, without even a topic to guide you. But you can manage if you have a plan and take one step at a time.

If you are starting from scratch, your first task is to find a research question worth investigating that will lead to a research problem worth solving. Here are four steps to that end:

Find a topic specific enough to let you master a reasonable amount of information on it in the time you have: not, for example, *the history of scientific writing* but *essays in the Proceedings of the Royal Society (1675–1750) as precursors to the modern scientific article*; not *doctors in seventeenth-century drama* but *Molière's mockery of doctors in three early plays*.

Question that topic until you find questions that catch your interest. For example, *How did early Royal Society authors demonstrate that their evidence was reliable?* Or, *Why did Molière mock doctors?*

Determine the kinds of evidence your readers will expect you to offer in support of your answer. Will they accept reports of facts from secondary sources, or will they expect you to consult primary sources (see 5.1.1)?

Will they expect quantitative data, quotations from authorities, or firsthand observations?

Determine whether you can find this evidence. There's no point researching a topic unless you have a good chance of finding the right kind of evidence.

Once you think you have enough data to support at least a plausible answer to your question, you'll be ready to assemble an argument that makes your case (see [part III](#)), then to plan, draft, and revise it (see [part IV](#)).

You'll discover, however, that you can't march through those steps in the neat order we present them. You'll think of a tentative answer to your research question before you have all the evidence you need to support it. And when you think you have an argument worth making, you may discover that you need more and maybe different evidence from new sources. You may even modify your topic. Doing research is not like strolling along an easy, well-marked path to a familiar destination; it's more like zigzagging up and down a rocky hill through overgrown woods, sometimes in a fog, searching for something you won't recognize until you see it. But no matter how indirect your path, you can make progress if at each step of the way you plan for predictable detours (and maybe even avoid some of them).

What Is Your Evidence?

No matter their field, researchers collect information to use as evidence to support their claims. But researchers in different fields call that information by different names. We call it *data*. By *data* we mean not just the numbers that natural and social scientists collect, but anything you find "out there" relevant to answering your research question. The term is used less often by researchers in the humanities, but they, too, gather data in the form of quotations, historical facts, and so on. Data are inert, however, until you use them to support a claim that answers your research question. At that point, your data become *evidence*. If you don't have more data than you can use as evidence, you haven't collected enough. (Incidentally, *data* is plural; a single bit of data is a *datum*.)

Resolve to do lots of writing along the way. Much of it will be routine note-taking, but you should also write reflectively, to understand: make outlines; explain why you disagree with a source; draw diagrams to connect disparate facts; summarize sources, positions, and schools; record even random thoughts. Many researchers find it useful to keep a journal for hunches, new ideas, random thoughts, problems, and so on. You might not include much of this writing-to-discover-and-understand in your final draft. But when you *write as you go, every day*, you encourage your own best critical thinking, understand your sources better, and, when the time comes, draft more productively.

Quick Tip: Creating a Writing Group

A downside of academic research is its isolation. Except for group projects, you'll read and write mostly alone. But it doesn't have to be that way. Look for someone other than your instructor or adviser who will talk with you about your progress, review your drafts, even pester you about how much you've written. That might be a generous friend, but even better is another writer so that you can comment on each other's ideas and drafts.

Best of all is a group of four or five people working on their own projects who meet regularly to read and discuss one another's work. Early on, each meeting should start with a summary of each person's project in this three-part sentence: *I'm working on X because I want to find out Y, so that I (and you) can better understand Z* (more about this in 3.4). As your projects advance, develop an opening "elevator story," a short summary of your project that you could give someone on the way to a meeting. It should include your research question, your best guess at an answer, and the kind of evidence you expect to use to support it. The group can then follow up with questions, responses, and suggestions.

Don't limit your talk to just your story, however. Talk about your readers: Why should they be interested in your question? How might they respond to your argument? Will they trust your evidence? Will they have other evidence in mind? Such questions help you plan an argument that anticipates what your readers expect. Your group can even help you brainstorm when you bog down. Later the group can read one another's outlines and drafts to imagine how their final readers will respond. If your group has a problem with your draft, so will those readers. But for most writers, a writing group is most valuable for the discipline it imposes. It is easier to meet a schedule when you know you must report to others.

Writing groups are common for those writing theses or dissertations. But the rules differ for a class paper. Some teachers think that a group or writing partner provides more help than is appropriate, so be clear what your instructor allows.

3 From Topics to Questions

In this chapter, we discuss how to find a topic among your interests, refine it to a manageable scope, then question it to find the makings of a problem that can guide your research. If you are an experienced researcher or know the topic you want to pursue, skip to [chapter 4](#). But if you are starting your first project, you will find this chapter useful.

If you are new to research, the freedom to pick your own topic can seem daunting. Where do you begin? How do you tell a good topic from a bad one? Inexperienced researchers typically wonder, *Will I find enough information on this topic to write about it?* To their surprise they often compile too much information, much of it not very useful. They do so because their topic lacks focus. Without that focus, any evidence you assemble risks appearing to your readers as little more than a mound of random facts. As you begin a research project, you will want to distinguish a topic from a subject. A subject is a broad area of knowledge (e.g., climate change), while a topic is a specific interest within that area (e.g., the effect of climate change on migratory birds). However, finding a topic is not simply a matter of narrowing your subject. A topic is an approach to a subject, one that asks a *question* whose answer solves a *problem* that your readers care about.

In all research communities, some questions are “in the air,” widely debated and researched, such as whether traits like shyness or an attraction to risk are learned or genetically inherited. But other questions may intrigue only the researcher: *Why do cats rub their faces against us? Why does a coffee spill dry up in the shape of a ring?* That’s how a lot of research begins—not with a big question that attracts everyone in a field, but with a mental itch about a small question that only a single researcher wants to scratch. If you feel that itch, start scratching. But at some point, you must decide whether the answer to your question solves a problem significant to some community of researchers or even to a public whose lives your research could change.

Question or Problem?

You may have noticed that we’ve been using the words *question* and

problem almost interchangeably. But they are not quite the same. Some questions raise problems; others do not. A question raises a problem if not answering it keeps us from knowing something more important than its answer. For example, if we cannot answer the question *Are there ultimate particles?*, we cannot know

something even more important: the nature of physical existence. On the other hand, a question does not raise a problem if not answering it has no apparent consequences. For example, *Was Abraham Lincoln's right thumb longer than his nose?* We cannot think of what we would gain by knowing. At least at the moment.

Now, that word *problem* is itself a problem. Commonly, a problem means trouble, but among researchers it has a meaning so special that we devote the next chapter to it. But before you can frame your research problem, you have to find a topic that might lead to one. So we'll start there, with finding a topic.

3.1 FROM AN INTEREST TO A TOPIC

Most of us have more than enough interests, but beginners often find it hard to locate among theirs a topic focused enough to support a substantial research project. They may also believe they lack the expertise for the project. However, a research topic is an interest stated specifically enough for you to imagine *becoming* a local expert on it. That doesn't mean you already know a lot about it or that you'll have to know more about it than others, including your teacher. You just want to know a lot more about it than you do now.

If you can work on any topic, we offer only a cliché: start with what most interests you. Nothing contributes to the quality of your work more than your commitment to it. But also ask yourself: *What interests me about this topic? What would interest others?*

3.1.1 Finding a Topic in a Writing Course

Start by listing as many interests as you can that you'd like to explore. Don't limit yourself to what you think might interest a teacher or make you look like a serious student. Let your ideas flow. Prime the pump by asking friends, classmates, even your teacher about topics that interest them. If no good topics come to mind, consult the Quick Tip at the end of this chapter.

Once you have a list of topics, choose the one or two that interest you most and explore their research potential. Do this:

In the library, look up your topic in a general guide such as *CQ Researcher* and skim the subheadings. In an online database such as Academic Search Premier, you can explore your topic through subject terms. If you have a more narrow focus, you can do the same with specialized guides such as *Women's Studies*

International. While some libraries will have copies of general and specialized guides on the shelf, most now subscribe to their online equivalents, but not all of them let you skim subject headings. (We discuss these resources in [chapter 5](#) and list several in the appendix.)

On the Internet, Google your topic, but don't surf indiscriminately. Look first for websites that are roughly like sources you would find in a library, such as online encyclopedias. Read the entry on your general topic, and then copy the list of references at the end for a closer look. Use *Wikipedia*

to find ideas and sources, but always confirm what you find there in a reliable source. Few experienced researchers trust *Wikipedia*, so *under no circumstances cite it as a source of evidence* (unless your topic is *Wikipedia* itself).

Remember, at this point you are exploring a topic to spur your thinking and to see if that topic is viable. With that in mind, you can also find ideas in blogs, which discuss almost every contentious issue. Since most issues are usually too big for a research paper, look for posts that take a position on narrow aspects of larger issues. If you disagree with a view, investigate it.

3.1.2 Finding a Topic for a First Research Project in a Particular Field

Start by listing topics relevant to your particular class *and* that interest you, then narrow them to one or two promising ones. If the topic is general, such as *religious masks*, you'll have to do some random reading to narrow it. But read with a plan:

Skim encyclopedia entries in your library or online. Start with standard ones such as the *Encyclopaedia Britannica*. Then consult specialized ones such as the *Encyclopedia of Religion* or the *Stanford Encyclopedia of Philosophy*.

Skim headings in specialized indexes such as the *Philosopher's Index*, *Psychological Abstracts*, or *Women's Studies Abstracts*. Use subheadings for ideas of how others have narrowed your topic.

Google your topic, but not indiscriminately. Use Google Scholar, a search engine that focuses on scholarly journals and books. Skim the articles it turns up, especially their lists of sources.

When you know the general outline of your topic and how others have narrowed theirs, try to narrow yours. If you can't, browse through journals and websites until your topic becomes more clearly defined. That takes time, so start early.

3.1.3 Finding a Topic for an Advanced Project

Most advanced students already have interests in topics relevant to their field. Often topics find them as they become immersed in a field. If that is not yet the case, focus on what interests you, but remember that you must eventually show why it should also interest others.

Find what interests other researchers. Look online for recurring issues and debates in the archives of professional discussion lists relevant to your interests. Search online and in journals like the *Chronicle of Higher Education* for conference announcements, conference programs, calls for papers, anything that reflects what others find interesting.

Skim the latest issues of journals in your field, not just for articles, but also for conference announcements, calls for papers, and reviews. Skim recent articles in your library's online databases in your field (e.g., the MLA International Bibliography).

Investigate the resources that your library is particularly rich in. If, for example, it (or a library nearby) holds a collection of rare papers on an interesting topic, you have found not only a topic but a way into it. Many unexpected finds await discovery in your library's archives.

3.2 FROM A BROAD TOPIC TO A FOCUSED ONE

The most useful way to think about a topic is as a starting place for your research. (The word "topic" comes from *topos*, which is Greek for "place.") From this starting place, you can head off in a particular direction and thus narrow an overly broad topic into a productively focused one. At this point, your biggest risk is settling on a topic so broad that it could be a subheading in a library catalog: *spaceflight*; *Shakespeare's problem plays*; *natural law*. A topic is probably too broad if you can state it in four or five words:

Free will in Tolstoy

The history of commercial aviation

A topic so broad can intimidate you with the task of finding, much less reading, even a fraction of the sources available. So narrow it down:

We narrowed those topics by adding words and phrases, but of a special kind: *conflict*, *description*, *contribution*, and *developing*. Those nouns are derived from verbs expressing actions or relationships: *to conflict*, *to describe*, *to contribute*, and *to develop*. Lacking such “action” words, your topic is a static thing.

Note what happens when we restate static topics as full sentences. Topics

and (2) change almost not at all:

Free will in Tolstoy_{topic} → There is free will in Tolstoy’s novels._{claim}

The history of commercial aviation_{topic} → Commercial aviation has a history._{claim}

In reality, (1) and (2) are not topics at all because they do not lead anywhere. But when (3) and (4) are revised into full sentences, they are closer to claims that a reader might find interesting.

The *conflict* of free will and inevitability in Tolstoy’s *description* of three battles in *War and Peace*_{topic} → In *War and Peace*, Tolstoy *describes* three battles in which free will and inevitability *conflict*._{claim}

The *contribution* of the military in *developing* the DC-3 in the early years of commercial aviation_{topic} → In the early years of commercial aviation, the military *contributed* to the way the DC-3 *developed*._{claim}

Such claims may at first seem thin, but you’ll make them richer as you work through your project. And that’s the point: these topics are actually paths to pursue when devising your project.

Caution: Don’t narrow your topic so much that you can’t find information on it. Too much information is available on *the history of commercial aviation* but too little (at least for beginning researchers) on *the decision to lengthen the wingtips on the DC-3 prototype for military use as a cargo carrier*.

3.3 FROM A FOCUSED TOPIC TO QUESTIONS

Once they have a focused topic, many new researchers make a beginner's mistake: they immediately start plowing through all the sources they can find on the topic, taking notes on everything they read. With a promising topic such as *the political origins of legends about the Battle of the Alamo*, they mound up endless facts connected with the battle: what led up to it, histories of the Texas Revolution, the floor plan of the mission, even biographies of generals Santa Anna and Sam Houston. They accumulate notes, summaries, descriptions of differences and similarities, ways in which the stories conflict with one another and with what historians think really happened, and so on. Then they dump it all into a paper that concludes, *Thus we see many differences and similarities between . . .*

Many high school teachers would reward such a paper with a good grade, because it shows that the writer can focus on a topic, find information on it, and assemble that information into a report, no small achievement—for a first project. But in *any* college course, such a report falls short if it is seen as just a pastiche of vaguely related facts. If a writer asks no specific *question* worth asking, he can offer no specific *answer* worth supporting. And without an answer to support, he cannot *select* from all the data he could find on a topic just those relevant to his answer. To be sure, those fascinated by Elvis Presley movie posters or the first generation of video games will read *anything* new about them, no matter how trivial. Serious researchers, however, do not document information for its own sake, but to support the answer to a question that they (and they hope their readers) think is worth asking.

So the best way to begin working on your focused topic is not to find all the information you can on it, but to formulate questions that direct you to just that information you need to answer them.

Start with the standard journalistic questions: *who*, *what*, *when*, and *where*, but focus on *how* and *why*. To engage your best critical thinking, systematically ask questions about your topic's history, composition, and categories. Then ask any other question you can think of or find in your sources. Record all the questions, but don't stop to answer them even when one or two grab your attention. This inventory of possible questions will help to direct your search activities and enable you to make sense of information

you find. (Don't worry about keeping these categories straight; their only purpose is to stimulate questions and organize your answers.) Let's take up the example of masks mentioned earlier.

3.3.1 Ask about the History of Your Topic

How does it fit into a **larger developmental context**? Why did your topic come into being? *What came before masks? How were masks invented? Why? What might come after masks?*

What is its own **internal history**? How and why has the topic itself changed through time? *How have Native American masks changed? Why? How have Halloween masks changed? How has the role of masks in society changed? How has the booming market for kachina masks influenced traditional design? Why have masks helped make Halloween the biggest American holiday after Christmas?*

3.3.2 Ask about Its Structure and Composition

How does your topic fit into the **context of a larger structure or function as part of a larger system**? *How do masks reflect the values of different societies and cultures? What roles do masks play in Hopi dances? In scary movies? In masquerade parties? How are masks used other than for disguise?*

How do its parts **fit together as a system**? *What parts of a mask are most significant in Hopi ceremonies? Why? Why do some masks cover only the eyes? Why do few masks cover just the bottom half of the face? How do their colors play a role in their function?*

3.3.3 Ask How Your Topic Is Categorized

How can your topic be **grouped into kinds**? *What are the different kinds of masks? Of Halloween masks? Of African masks? How are they categorized by appearance? By use? By geography or society? What are the different qualities of masks?*

How does your topic **compare to and contrast with** others like it? *How do Native American ceremonial masks differ from those in Japan? How do Halloween masks compare with Mardi Gras masks?*

3.3.4 Turn Positive Questions into Negative Ones

Why have masks not become a part of other holidays, like Presidents' Day or Memorial Day? How do Native American masks not differ from those in Africa? What parts of masks are typically not significant in religious ceremonies?

3.3.5 Ask *What If?* and Other Speculative Questions

How would things be different if your topic never existed, disappeared, or were put into a new context? *What if no one ever wore masks except for safety? What if everyone wore masks in public? What if it were customary to wear masks on blind dates? In marriage ceremonies? At funerals? Why are masks common in African religions but not in Western ones? Why don't hunters in camouflage wear masks? How are masks and cosmetic surgery alike?*

3.3.6 Ask Questions Suggested by Your Sources

You won't be able to do this until you've done some reading on your topic.

Ask questions that **build on agreement**:

If a source makes a claim you think is persuasive, ask questions that might extend its reach. *Elias shows that masked balls became popular in eighteenth-century London in response to anxieties about social mobility. Did the same anxieties cause similar developments in Venice?*

Ask questions that might support the same claim with new evidence. *Elias supports his claim about masked balls with published sources. Is it also supported by letters and diaries?*

Ask questions analogous to those that sources have asked about similar topics. *Smith analyzes costumes from an economic point of view. What would an economic analysis of masks turn up?*

Now ask questions that reflect **disagreement**:

Martinez claims that carnival masks uniquely allow wearers to escape social norms. But could there be a larger pattern of all masks creating a sense of alternative forms of social or spiritual life?

(We discuss in more detail how to use disagreements with sources in 6.4.) If you are an experienced researcher, look for questions that other

researchers ask but don't answer. Many journal articles end with a paragraph or two about open questions, ideas for more research, and so on (see 4.3.2 for an example). You might not be able to do all the research they suggest, but

you might carve out a piece of it. You can also look for Internet discussions on your topic, then "lurk," just reading the exchanges to understand the kinds of questions those on the list debate. Record questions that spark your interest. You can also post questions to the list if they are specific and narrowly focused.

3.3.7 Evaluate Your Questions

After asking all the questions you can think of, evaluate them, because not all questions are equally good. Look for questions whose answers might make you (and, ideally, your readers) think about your topic in a new way. Avoid questions like these:

Their answers are settled fact that you could just look up. *Do the Inuit use masks in their wedding ceremonies?* Questions that ask *how* and *why* invite deeper thinking than *who*, *what*, *when*, or *where*, and deeper thinking leads to more interesting answers.

Their answers would be merely speculative. *Would church services be as well attended if the congregation all wore masks?* If you can't imagine finding hard data that might settle the question, it's a question you can't settle.

Their answers are dead ends. *How many black cats slept in the Alamo the night before the battle?* It is hard to see how an answer would help us think about any larger issue worth understanding better, so it's a question that's probably not worth asking.

You might, however, be wrong about that. Some questions that seemed trivial, even silly, have answers more significant than expected. One researcher wondered why a coffee spill dries up in the form of a ring and discovered things about the properties of fluids that others in his field thought important—and that paint manufacturers found valuable. So who knows where a question about cats in the Alamo might take you? You can't know until you get there.

Once you have a few promising questions, try to combine them into larger ones. For example, many questions about the Alamo story ask about the interests of the storytellers

and their effects on their stories: *How have politicians used the story? How have the storytellers' motives changed? Whose purposes does each story serve?* These can be combined into a single question:

How and why have users of the Alamo story given the event a mythic quality?

A question like this gives direction to your research (and helps avoid the gathering of endless information). And it begins to imagine readers who will judge whether your question is significant.

3.4 THE MOST SIGNIFICANT QUESTION: SO WHAT?

Even if you are an experienced researcher, you might not be able to take the next step until you are well into your project, and if you are a beginner, you may find it frustrating. Even so, once you have a question that holds your interest, you must pose a tougher one about it: *So what?* Beyond your own interest in its answer, why would others think it a question worth asking? You might not be able to answer that *So what?* question early on, but it's one you have to start thinking about, because it forces you to look beyond your own interests to consider how your work might strike others.

Think of it like this: What will be lost if you *don't* answer your question? How will *not* answering it keep us from understanding something else better than we do? Start by asking *So what?* at first of yourself:

So what if I don't know or understand how butterflies know where to go in the winter, or how fifteenth-century musicians tuned their instruments, or why the Alamo story has become a myth? So what if I can't answer my question? What do we lose?

Your answer might be *Nothing. I just want to know.* Good enough to start, but not to finish, because eventually your readers will ask as well, and they will want an answer beyond *Just curious.* Answering *So what?* vexes all researchers, beginners and experienced alike, because when you have only a question, it's hard to predict whether others will think its answer is significant. But you must work toward that answer throughout your project. You can do that in three steps.

3.4.1 Step 1: Name Your Topic

If you are beginning a project with only a topic and maybe the glimmerings of a good question or two, start by naming your project:

I am trying to learn about/working on/studying _____.

Fill in the blank with your topic, using some of those nouns derived from verbs:

I am studying the *causes* of the *disappearance* of large North American mammals . . .

I am working on Lincoln's *beliefs* about *predestination* and their *influence* on his *reasoning* . . .

3.4.2 Step 2: Add an Indirect Question

Add an indirect question that indicates what you do not know or understand about your topic:

I am studying/working on _____

because I want to find out who/what/when/where/whether/why/how
_____.

I am studying the causes of the disappearance of large North American mammals
because I want to find out whether they were hunted to extinction . . .

I am working on Lincoln's beliefs about predestination and its influence on his reasoning

because I want to find out how his belief in destiny influenced his understanding of the causes of the Civil War . . .

When you add that *because I want to find out how/why/whether* clause, you state why *you* are pursuing your topic: to answer a question important to you. If you are a new researcher and get this far, congratulate yourself, because you have moved beyond the aimless collection of data. But now, if you can, take one step more. It's one that advanced researchers know they must take, because they know their work will be judged not by its

significance to them but by its significance to others in their field. They must have an answer to So what?

3.4.3 Step 3: Answer So *What?* by Motivating Your Question

This step tells you whether your question might interest not just you but others. To do that, add a second indirect question that explains why you asked your first question. Introduce this second implied question with *in order to help my reader understand how, why, or whether*:

I am studying the causes of the disappearance of large North American mammals

because I want to find out whether the earliest peoples hunted them to extinction,

in order to help my reader understand whether native peoples lived in harmony with nature or helped destroy it.

I am working on Lincoln's beliefs about predestination and their influence on his reasoning

because I want to find out how his belief in destiny and God's will influenced his understanding of the causes of the Civil War,

in order to help my reader understand how his religious beliefs may have influenced his military decisions.

It is the indirect question in step 3 that you hope will seize your readers' interest. If it touches on issues important to your field, even indirectly, then your readers should care about its answer.

Some advanced researchers begin with questions that others in their field already care about: *Why did the giant sloth and woolly mammoth disappear from North America? Or: Is risk taking genetically based?* But many researchers, including at times the five of us, find that they can't flesh out the last step in that three-part sentence until they finish a first draft. So you make no mistake *beginning* your research without a good answer to that third question—*Why does this matter?*—but you face a problem when you *finish* your research without having thought through those three steps at all. And if you are doing advanced

research, you *must* take that step, because answering that last question is your ticket into the conversation of your community of researchers.

Regularly test your progress by asking a roommate, relative, or friend to force you to flesh out those three steps. Even if you can't take them all confidently, you'll know where you are and where you still have to go. To summarize: Your aim is to explain

what you are writing about—*I am working on the topic of . . .*

what you don't know about it—*because I want to find out . . .*

why you want your reader to know and care about it—*in order to help my reader understand better . . .*

In the following chapters, we return to those three steps and their implied questions, because they are crucial not just for finding questions but for framing the research problem that you want your readers to value.

Quick Tip: Finding Topics

If you are a beginner, start with our suggestions about exploring the Internet and skimming bibliographical guides (see 3.1). If you still draw a blank, try these steps.

FOR GENERAL INTEREST TOPICS

What special interest do you have—sailing, chess, finches, old comic books? The less common, the better. Investigate something about it you don't know: its origins, its technology, how it is practiced in another culture, and so on.

Where would you like to travel? Surf the Internet, finding out all you can about your destination. What particular aspect surprises you or makes you want to know more?

Wander through a museum with exhibitions that appeal to you—artworks, dinosaurs, old cars. If you can't browse in person, browse a "virtual museum" on the Internet. Stop when something catches your interest. What more do you want to know about it?

Wander through a shopping mall or store, asking yourself, *How do they make that? Or, I wonder who thought up that product?*

Leaf through a Sunday newspaper, especially its features sections. Skim reviews of books or movies, in newspapers or on the Internet.

Browse a large magazine rack. Look for trade magazines or those that cater to specialized interests. Investigate whatever catches your interest.

Tune into talk radio or interview programs on TV until you hear a claim that you disagree with. Or find something to disagree with on the websites connected with well-known talk shows. See whether you can make a case to refute it.

Use an Internet search engine to find websites related to your topic. These include blogs maintained by individuals and organizations. You'll get hundreds of hits, but look only at the ones that surprise you.

Is there a common belief that you suspect is simplistic or just wrong? A common practice that you find pointless or irritating? Do research to make a case against it.

What courses will you take in the future? What research would help you prepare for them?

FOR TOPICS FOCUSED ON A PARTICULAR FIELD

If you have experience in your field, review 3.1.2–3.

Browse through a textbook of a course that is one level beyond yours or a course that you know you will have to take. Look especially hard at the study questions.

Attend a lecture for an advanced class in your field, and listen for something you disagree with, don't understand, or want to know more about.

Ask your instructor about the most contested issues in your field.

Find an Internet discussion list in your field. Browse its archives, looking for matters of controversy or uncertainty.

Surf the websites of departments at major universities, including class sites. Also check websites of museums, national associations, and government agencies, if they seem relevant.

4 From Questions to a Problem

In this chapter, we explain how to turn a question into a problem that readers think is worth solving. If you are an advanced researcher, you know how essential this step is. If you are new to research, we hope to convince you of its importance, because what you learn here will be essential to all your future projects.

In the last chapter, we suggested that you can identify the significance of your research question by fleshing out this three-step formula:

Topic: I am studying _____

Question: because I want to find out what/why/how _____,

Significance: in order to help my reader understand _____.

These steps describe not only the development of your project but your own development as a researcher.

When you move from step 1 to 2, you are no longer a mere data collector but a researcher interested in understanding something better.

When you then move from step 2 to 3, you focus on why that understanding is *significant*.

That significance might at first be just for yourself, but you join a community of researchers when you can state that significance *from your readers' point of view*. In so doing, you create a stronger relationship with readers because you promise something in return for their interest in your report—a deeper understanding of something that matters to *them*. At that point, you have posed a *problem* that they recognize needs a solution.

4.1 UNDERSTANDING RESEARCH PROBLEMS

Too many researchers at all levels write as if their task is to answer a question that interests themselves alone. That's wrong: to make your research matter, you must address a problem that others in your community—your readers— also want to solve. To understand why, you have to understand what research problems look like. And to do that, you have to understand two other kinds of problems, what we'll call practical problems and conceptual problems.

4.1.1 Practical Problems: What Should We Do?

Everyday research usually begins not with dreaming up a topic to think about but with a practical problem that if you ignore it means trouble. When its solution is not obvious, you have to find out how to solve it. To do that, you must pose and solve a problem of another kind, a *research* problem defined by what you *do not know or understand* about your practical problem.

It's a familiar task that typically looks like this:

PRACTICAL PROBLEM: The chain on my bicycle broke.

RESEARCH PROBLEM: Can I find a bike shop that will replace it?

RESEARCH SOLUTION: Here it is: Cycle Source, 1401 East 55th Street.

PRACTICAL SOLUTION: Walk over to get my bike fixed.

Problems like that are in essence no different from more complicated ones.

The National Rifle Association is lobbying me to oppose gun control. *How many votes do I lose if I refuse?* Do a survey. *Most of my constituents support gun control.* I can reject the request.

Costs are up at the Omaha plant. *What changed?* Hire a consulting firm to figure it out. *Increase in turnover.* If we improve training and morale, our workers will stick with us.

Put in general terms, a *practical* problem is caused by some condition in the world (from spam to losing money in Omaha to terrorism) that troubles us because it costs us time, money, respect, security, opportunity, even our lives. We solve a practical problem by

doing something (or by encouraging others to do something) to eliminate or at least mitigate the condition creating these tangible costs.

But to know what to do, someone first has to *understand* something better. That politician being lobbied by the NRA, for example, needs to know how his constituents feel about gun control so he can decide where he stands; the managers of the Omaha plant need to know the cause of their increasing costs so they can address it.

4.1.2 Conceptual Problems: What Should We Think?

That need for knowledge or understanding raises a conceptual problem. In research, a *conceptual* problem arises when we do not understand something about the world as well as we would like. We solve a conceptual problem not by doing something to change the world but by answering a question that helps us understand it better.

We usually answer these questions through research, which is why conceptual problems are also called research problems: the word *conceptual* describes their condition and costs or consequences; the word *research* refers to how we solve them. Graphically, the relationship between practical and conceptual or research problems looks like this:

The term *problem* thus has a special meaning in the world of research, one that sometimes confuses beginners. In our everyday world, a problem is

something we try to avoid. But in academic research, a problem is something we seek out, even invent if we have to. Indeed, a researcher without a good conceptual or research problem to work on faces a bad practical problem because without one a researcher is out of work.

Inexperienced researchers sometimes struggle with these notions because experienced researchers often talk about their work in shorthand. When asked what they are working on, they often answer with what sounds like one of those general topics we warned you about: *adult measles*, *mating calls of Wyoming elk*, *zeppelins in the 1930s*. As a result, beginners sometimes think that having a topic to read about is the same as having a problem to solve.

When they do, they create a big practical problem for themselves, because with only a topic to guide their work, they gather data aimlessly and endlessly. Without a specific question to answer, they have no way of knowing when they have enough. When they write, they struggle to decide what to include, usually throwing in everything just to be on the safe side. So it's not surprising that they feel frustrated when a reader says, *I don't see the point here; this is just a data dump*.

To avoid that judgment, you need a problem that focuses you on finding just those data that will help you solve it. It might take a while to figure out what that problem is, but from the outset you have to think about it. That begins with understanding how conceptual problems work.

4.2 UNDERSTANDING THE COMMON STRUCTURE OF PROBLEMS

Practical problems and conceptual problems have the same two-part structure:

a situation or *condition*, and undesirable *consequences* caused by that condition, *costs* that you (or, better, your readers) don't want to pay

What distinguishes them is the nature of those conditions and costs.

4.2.1 The Nature of Practical Problems

Consider a flat tire. Ordinarily, it would be a practical problem, because it is

a condition in the world (the flat) that imposes (2) a tangible cost that you don't want to pay, like missing a dinner date. But suppose you were bullied into the date and would rather be anywhere else. In that case, the benefit of the flat is more than its cost, so the flat is not a problem but a solution to the bigger problem of an evening spent with someone you don't like. Low cost, big benefit, no problem.

On the other hand, suppose the police set up a sting in which they lure criminals out of hiding by announcing that they have won the lottery. Ordinarily, winning the lottery is not a problem, but here it is, because it has a tangible cost: arrest.

A practical problem has two parts: a condition, which can be anything that imposes intolerable costs, and those costs. To state a practical problem so that others understand it clearly, you must describe both of its parts.

Its **condition**:

I missed the bus.

The ozone layer is thinning

The **costs** of that condition that you (or your reader) don't like: I'll be late for work and lose my job.

Many will die from skin cancer.

But a caution: When you write, readers judge the significance of your problem not by the cost *you* pay, but by the cost *they* pay if you don't solve it. So what *you* think is a problem they might not. To make your problem their problem, you must frame it from

their point of view, so that they see its costs to *them*. To do that, imagine that when you pose the condition part of your problem, your reader responds, *So what?*

The ozone layer is thinning.

So what?

You answer with the cost of the problem:

A thinner ozone layer exposes us to more ultraviolet light.

Suppose he again asks, *So what?*, and you respond with the cost of more ultraviolet light:

Too much ultraviolet light can cause skin cancer.

If, however improbably, he again asks, *So what?*, you have failed to convince him that *he* has a problem. We acknowledge a problem only when we stop asking *So what?* and say, instead, *What do we do about it?*

Practical problems like cancer are easy to grasp because they are concrete: when someone has cancer, we don't ask, *So what?* In academic research, however, your problems will usually be conceptual ones, which are harder to grasp because both their conditions and costs are abstract.

4.2.2 The Nature of Conceptual Problems

Practical and conceptual problems have the same two-part structure, but they have different kinds of conditions and costs.

The condition of a practical problem can be *any* state of affairs that has a tangible cost for you or, better, for your readers.

The condition of a conceptual problem, however, is *always* some version of not knowing or not understanding something.

You can identify the condition of a conceptual problem by completing that three-step sentence (see 3.4): The first step is *I am studying/working on the topic of _____*. In the second step, the indirect question states the condition of a conceptual problem, what you do not know or understand:

I am studying stories of the Alamo, because I want to understand **why voters responded to them in ways that served the interests of Texas politicians.**

That's why we emphasize the value of questions: they force you to state what you don't know or understand but want to.

The two kinds of problems also have two different kinds of costs.

The **cost** of a practical problem is always some tangible thing or situation we don't like.

A conceptual problem does not have such a tangible cost. In fact, we'll emphasize this difference by calling the cost of a conceptual problem its *consequence*.

The **consequence** of a conceptual problem is a particular kind of ignorance: it is a lack of understanding that keeps us from understanding something else even more significant. Put another way, because we haven't answered one question, we can't answer another that is more important.

Researchers often choose projects simply because they are curious. In fact, that's how most of us first become interested in the subjects we study. But to make your research matter to others, you have to say more than *Here is something I find interesting*. You have to show them how solving your problem helps them solve theirs. You do that by explaining your problem's consequence.

You express a problem's consequence in the indirect question in step 3 of our formula:

I am studying stories of the Alamo, because I want to understand why voters responded to them in ways that served the interests of local Texas politicians, in order to help readers understand the bigger and more important question **of how regional self-images influence national politics.**

All of this may sound confusing, but it's simpler than it seems. The condition and the consequence of a conceptual problem are questions that relate to each other in two ways:

The answer to the first question (Q1) helps you answer the second (Q2).

The answer to the second question (Q2) is more important than the answer to the first (Q1).

Here it is again: The first part of a conceptual or research problem is something you don't know but want to. You can phrase that gap in knowledge or understanding as a direct question: *How have romantic movies changed in the last fifty years?* Or as an indirect question: *I want to find out how romantic movies have changed in the last fifty years.*

Now imagine someone asking, *So what if you can't answer that question?* You answer by stating *something else more important* that you can't know until you answer the first question. For example:

If we can't answer the question of how romantic movies have changed in the last fifty years,*condition/first question* **then we can't answer a more**

important question: How have our cultural depictions of romantic love
changed?consequence/larger, more important second question

If you think that it's important to answer that second question, you've stated a consequence that makes your problem worth pursuing, and if your readers agree, you're in business.

But what if you imagine a reader again asking, *So what if I don't know whether we depict romantic love differently than we did?* You have to pose a yet larger question that you hope your readers will think is significant:

If we can't answer the question of how our depictions of romantic love have changed,*second question* **then we can't answer an even more important**

one: How does our culture shape the expectations of young men and
women about marriage and families?consequence/larger, more important

question

If you imagine that reader again asking, *So what?*, you might think, *Wrong audience*. But if that's the audience you're stuck with, you just have to try again: *Well, if we don't answer that question, we can't . . .*

Those outside an academic field often think that its specialists ask ridiculously trivial questions: *How did hopscotch originate?* But they fail to realize that researchers want to answer a question like that so that they can answer a second, more important one. For those who care about the way folk games influence the social development of children, the

conceptual consequences of not knowing justifies the research. *If we can discover how children's folk games originate, we can better understand how games socialize children, and, before you ask, once we know that, we can better understand . . .*

4.2.3 Distinguishing “Pure” and “Applied” Research

We call research *pure* when it addresses a conceptual problem that does not bear directly on any practical situation in the world, when it only improves the understanding of a community of researchers. We call research *applied* when it addresses a conceptual problem that does have practical consequences. You can tell whether research is pure or applied by looking at the last of the three steps defining your project. Does it refer to knowing or doing?

Topic: I am studying the electromagnetic radiation in a section of the universe

Question: because I want to find out how many galaxies are in the sky,

Significance: in order to help readers *understand* whether the universe will expand forever or eventually collapse into a point.

That is pure research, because step 3 refers only to understanding. In applied research, the second step still refers to *knowing* or

understanding, but that third step refers to *doing*:

Topic: I am studying how readings from the Hubble telescope differ from readings for the same stars measured by earthbound telescopes

Question: because I want to find out how much the atmosphere distorts measurements of electromagnetic radiation,

Practical Significance: so that astronomers can use data from earthbound telescopes *to measure* more accurately the density of electromagnetic radiation.

That problem calls for applied research because only when astronomers *know* how to account for atmospheric distortion can they *do* what they want to— measure light more accurately.

4.2.4 Connecting Research to Practical Consequences

Some inexperienced researchers are uneasy with pure research because the consequence of a conceptual problem—merely not knowing something—is so abstract. Since they are not yet part of a community that cares deeply about understanding its part of the world, they feel that their findings aren't good for much. So they try to cobble a practical cost onto a conceptual question to make it seem more significant:

Topic: I am studying differences among nineteenth-century versions of the Alamo story

Research Question: because I want to find out how politicians used stories of such events to shape public opinion,

Potential Practical Significance: in order to protect ourselves from unscrupulous politicians.

Most readers would think that the link between steps 2 and 3 is a bit of a stretch.

To formulate a good applied research project, you have to show that the answer to the indirect question in step 2 *plausibly* helps answer the indirect question in step 3. Ask this question:

If my readers want to achieve the goal of _____ [state your objective from step 3],

would they think that they could do it if they found out _____? [state your question from step 2]

Try that test on this applied astronomy problem:

If my readers want to use data from earthbound telescopes to measure more accurately the density of electromagnetic radiation,

would they think that they could if they knew how much the atmosphere

distorts measurements?

The answer would seem to be Yes.

Now try the test on the Alamo problem:

If my readers want to protect themselves from unscrupulous politicians,

would they think they could if they knew how nineteenth-century politicians used stories about the Alamo to shape public opinion?

The answer would probably be *No*. We may see a connection, but it's a stretch.

If you think that the solution to your conceptual problem *might* apply to a practical one, formulate your project as pure research, then *add* your application as a *fourth* step:

Topic: I am studying how nineteenth-century versions of the Alamo story differ

Conceptual Question: because I want to find out how politicians used stories of great events to shape public opinion,

Conceptual Significance: in order to help readers understand how politicians use popular culture to advance their political goals,

Potential Practical Application: so that readers *might* better protect themselves from unscrupulous politicians.

When you state your problem in your introduction, however, present it as a purely conceptual research problem whose significance is in its conceptual consequences. Then wait until your conclusion to suggest its practical application. (For more on this, see [chapter 16](#).)

Most research projects in the humanities and many in the natural and social sciences have no direct application to daily life. But as the term *pure* suggests, many researchers value such research more than they do applied research. They believe that the pursuit of knowledge “for its own sake” reflects humanity’s highest calling: to know more, not for the sake of money or power, but for the transcendental good of greater understanding and a richer life of the mind.

As you may have guessed, we are deeply committed to pure research, but also to applied—so long as the research is done well and is not corrupted by malign motives. For example, the potential for profit might compromise the integrity of both pure and applied research in the biological sciences, because it can influence not only what problems some researchers choose to address but also their solutions: *Tell us what to look for, and we’ll provide it!* Such situations raise ethical questions that we touch on in our afterword, “The Ethics of Research.”

4.3 FINDING A GOOD RESEARCH PROBLEM

What distinguishes great researchers from the rest of us is the brilliance, knack, or just dumb luck of stumbling over a problem whose solution makes all of us see the world in a new way. It's easy to recognize a good problem when we bump into it, or it bumps into us. But researchers often begin a project without being clear about what their real problem is. Sometimes they hope just to define a puzzle more clearly. Indeed, those who find a new problem or clarify an old one often make a bigger contribution to their field than those who solve a problem already defined. Some researchers have even won fame for *disproving* a plausible hypothesis that they had set out to prove.

So don't be discouraged if you can't formulate your problem fully at the outset of your project. Few of us can. But thinking about it early will save you hours of work along the way (and perhaps panic toward the end). It also gets you into a frame of mind crucial to advanced work. Here are some things you can do to identify and refine a good problem.

4.3.1 Ask for Help

Do what experienced researchers do: talk to colleagues, teachers, classmates, relatives, friends, neighbors—anyone who might be interested. Why would anyone want an answer to your question? What would they do with it? What new questions might an answer raise?

If you are free to work on any problem, look for a small one that is part of a bigger one. Though you won't solve the big one, your small piece of it will inherit some of its larger significance. (You will also educate yourself about the problems of your field, no small benefit.) If you are a student, ask your teacher what she is working on and whether you can work on part of it. Don't let her suggestions define the limits of your research. Nothing discourages a teacher more than a student who does *exactly* what is suggested *and no more*. Teachers want you to use their suggestions to *start* your thinking, not *end* it. Nothing makes a teacher happier than when you use her suggestions to find something she never expected.

4.3.2 Look for Problems as You Read

You can also find research problems in your sources. Where in them do you see contradictions, inconsistencies, incomplete explanations? Tentatively assume that other readers would or should feel the same. Many research projects begin with an imaginary conversation with the author of a source: *Wait a minute, he's ignoring . . .* But

before you set out to correct a gap or misunderstanding, be sure it's real, not just your own misreading. Countless research papers have refuted a point that no one ever made. Before you correct a source, reread it carefully. (In 6.3 we list several common "moves" that writers make to find a problem in a source, variations on *Source thinks X, but I think Y.*)

Once you think you've found a real puzzle or error, do more than just point to it. If a source says X and you think Y, you may have a research problem, but only if you can show that those who think X misunderstand some larger issue as well.

Finally, read the last few pages of your sources closely. That's where many researchers suggest more questions that need answers. The author of the following paragraph had just finished explaining how the life of nineteenth-century Russian peasants influenced their performance as soldiers:

And just as the soldier's peacetime experience influenced his battlefield performance, so must the experience of the officer corps have influenced theirs. Indeed, a few commentators after the Russo-Japanese War blamed the Russian defeat on habits acquired by officers in the course of their economic chores. In any event, to appreciate the service habits of Tsarist officers in peace and war, *we need a structural—if you will, an anthropological—analysis of the officer corps like that offered here for enlisted personnel.* [our emphasis]

That last sentence offers a new problem waiting for you to tackle.

4.3.3 Look at Your Own Conclusion

Critical reading can also help you discover a good research problem in your own drafts. We often do our best thinking in the last few pages that we write, because there we formulate claims we did not anticipate when we started. If in an early draft you arrive at an unanticipated claim, ask yourself what question it might answer. Paradoxical as it might seem, you may have answered a question that you have not yet asked, and thereby solved a problem that you have not yet posed. Your task is to figure out what that problem might be.

4.4 LEARNING TO WORK WITH PROBLEMS

Experienced researchers dream of finding new problems to solve. A still bigger dream is to solve a problem that no one even knew they had. But that new problem isn't worth much until others think (or can be persuaded) that it needs solving. So the first question an experienced researcher should ask about a problem is not *Can I solve it?* but *Will readers think it should be solved?*

No one expects you to do all that the first time out. But you should begin to develop mental habits that will prepare you for that moment. Research is more than just accumulating and reporting facts. Try to formulate a question that *you* think is worth answering, so that down the road, you'll know how to find a problem that *others* think is worth solving. Until you can do that, you risk the worst response a researcher can get: not *I don't agree*, but *I don't care*.

By now, all this talk about airy academic research may seem disconnected from what some call the "real world." But in business and government, in law and medicine, in politics and international diplomacy, no skill is valued more highly than the ability to recognize a problem, then to articulate it in a way that convinces others both to care about it and to believe it can be solved, especially by you. If you can do that in a class on Byzantine pottery, you can do it in an office on Main Street, Wall Street, or Queen's Road in Hong Kong.

Quick Tip: Manage the Unavoidable Problem of Inexperience

We all feel anxious when we start work in a new field whose values, concerns, and ways of thinking and arguing we don't entirely understand. In fact, we authors still experience that newcomer's anxiety again when we begin new kinds of projects on new topics. You can't avoid experiencing that feeling at times, but there are ways to manage it:

Know that uncertainty and anxiety are natural and inevitable. Those feelings don't signal incompetence, only inexperience.

Get control over your topic by writing about it along the way. Don't just

retype or photocopy sources: write summaries, critiques, questions, responses to your sources. Keep a journal in which you reflect on your progress. This kind of writing not only helps you understand what you read but stimulates your thinking

about it. The more you write early on, no matter how sketchily, the easier it will be to face that intimidating first draft.

Break the task into manageable steps and know that they are mutually supportive. Once you formulate a good question, you'll draft and revise more effectively. The more you anticipate how you will write and revise a first draft, the more effectively you will produce it.

If you are a student, count on your teachers to understand your struggles. They want you to succeed, and you can expect their help. (If they don't help, look for others who will.)

Set realistic goals. You do something significant when you wind up your project feeling that it has changed just what *you* think and that your readers think you did it well, even if they don't agree with your claims.

Most important, recognize the struggle for what it is—a learning experience. To overcome the problems that all beginners face, do what successful researchers do, especially when discouraged: review your plan and what you've written, then press on, confident that it will turn out OK. Perhaps only "OK—considering," but probably a lot better than that.

5 From Problems to Sources

If you are a new researcher and expect to find most of your sources in your library or on the Internet, this chapter will help you develop a plan for your research. If you are more experienced, you might skip to the next chapter.

If you have not yet formulated a research question, you may have to spend time reading generally on your topic to find one. But if you have a question and at least one promising answer (the philosopher C. S. Peirce called it a *hypothesis on probation*), you can start looking for data to test it.

To do that efficiently, you need to have a plan. If you plunge into any and all sources on your topic, you risk losing yourself in an endless trail of books and articles. To be sure, aimless browsing can be fun, even productive. We indulge in it a lot. Many important discoveries have begun in a chance encounter with an unexpected idea. But if you have a deadline, you need more than luck to find good sources in time: you have to search systematically for those sources that will help you advance your research project or, just as usefully, challenge you to improve it. In this chapter, we discuss different ways you can use sources in your research, how you can find useful sources, and how you can winnow your sources to a manageable number. In the next chapter, we focus on how to use sources in your writing.

5.1 THREE KINDS OF SOURCES AND THEIR USES

Sources are conventionally categorized into three kinds: primary, secondary, and tertiary. Their boundaries are fuzzy, but knowing these categories can help you plan your research.

5.1.1 Primary Sources

Primary sources are “original” materials that provide you with the “raw data” or evidence you will use to develop, test, and ultimately justify your hypothesis or claim. What kinds of materials count as primary sources vary significantly by field. In history, primary sources are artifacts or documents that come directly from the period or event you are studying: letters, diaries, objects, maps, even clothing. In literature or philosophy, your main primary source is usually the text you are analyzing, and your data are the words on the page. In arts criticism, your primary source would be the work of art you are interpreting. In social sciences, such as sociology or political science, census or survey data would also count

as primary sources. In the natural sciences, reports of original research are sometimes characterized as primary sources (although scientists themselves rarely use that term).

5.1.2 Secondary Sources

Secondary sources are books, articles, or reports that are based on primary sources and are intended for scholarly or professional audiences. The body of secondary sources in a field is sometimes called that field's "literature." The best secondary sources are books from reputable university presses and articles or reports that have been "peer-reviewed," meaning that they were vetted by experts in the field before they were published. Researchers read secondary sources to keep up with developments in their fields and, in this way, to stimulate their own thinking. The standard way of framing new research problems is to challenge or build on the conclusions or methods of others, as presented in secondary sources they have written. You can also borrow evidence from secondary sources to use in your own arguments, but you should do so only if you do not have access to the primary sources from which that evidence was originally taken. Otherwise you risk appearing careless or lazy.

5.1.3 Tertiary Sources

These are books and articles that synthesize and report on secondary sources for general readers, such as textbooks, articles in encyclopedias (including *Wikipedia*), and articles in mass-circulation publications like *Psychology Today*. In the early stages of research, you can use tertiary sources to get a feel for a topic. But if you are making a scholarly argument, you should rely on secondary sources, because these make up the "conversation" in which you are seeking to participate. If you cite tertiary sources in a scholarly argument, you will mark yourself as either a novice or an outsider, and many readers won't take you—or your argument—seriously.

This response may seem unfair, but it's not. Tertiary sources aren't necessarily wrong—many are in fact written by distinguished scholars—but they are limited. Because they are intended for broad audiences who are unfamiliar with the topics that they address, they can sometimes oversimplify the research on which they are based, and they are susceptible to becoming outdated. But if you keep these limitations in mind, tertiary sources can be valuable resources: they can inform you about topics that are new to you, and if they have bibliographies, they can sometimes lead you to valuable secondary sources.

5.1.4 Differentiating Primary, Secondary, and Tertiary Sources

Researchers haven't always divided their sources into these three categories. The distinction between primary and secondary sources originated with historians in the nineteenth century and then spread to other fields. The category of tertiary sources was added later. Although this scheme is now the standard way that students are taught to classify sources, it fits some disciplines better than others: it works very well for history, in which primary sources are materials directly connected to a historical event or moment, and for criticism, in which primary sources are the original works of art, music, or literature that you are interpreting. But it works less well for, say, philosophy, chemistry, or nursing.

It is also important to understand that the classifications of primary, secondary, and tertiary are not absolute but relative to a researcher's project. In most instances, an article in a scholarly journal would generally be considered a secondary source. But it would become a primary source if your research problem concerned its author or the field itself: if, for example, you are writing the author's biography or trying to figure out whether patriotic historians have distorted stories of the Alamo. Likewise, an encyclopedia article would usually be considered a tertiary source, but it would become a primary source if you were studying the way encyclopedias deal with gender issues. T. S. Eliot's essay "Hamlet and His Problems" would be a primary source if you were studying Eliot but a secondary source if you were studying Shakespeare. Change your focus and you change the classification of your sources.

If this is confusing, it need not be. Remember that these classifications are just a means to an end. The important thing, ultimately, is not what you *call* your sources but how well you *use* them to address your research problems, develop new ideas, and make interesting arguments. In the next chapter, we will talk more about how you can use sources in your writing.

5.2 NAVIGATING THE TWENTY-FIRST-CENTURY LIBRARY

Walk into a university library today and you might wonder, "Where are the *books*?" (Answer: they are still there, though many have been moved to off-site storage.) The card catalog has long since been replaced by electronic search engines, and print materials—books, journals, photographs, films, video and audio recordings—are increasingly being

digitized. Today you don't even need to enter the library to use many of its resources. But whether you visit in person or through a website, the library is an indispensable tool for research.

Given the volume of data available on the Internet, you might think that libraries are no longer necessary—except, perhaps, for highly specialized research. We believe the opposite is true. Because *so much* information is now at our fingertips, libraries are more essential than ever when conducting research. Libraries not only let us access information but also ensure that our sources are reliable. Even if your public or academic library is comparatively small, it can serve as a *portal* to a much broader range of resources—research guides, reference works, and online databases—that extends the library's reach. Of course, to benefit from these resources, you must learn to navigate the twenty-first-century library.

5.2.1 Planning Your Library Search

Before you can use sources, you must first find and evaluate them. Some materials that will eventually serve as sources will be physically located in your library, but others are likely to be located elsewhere, whether online or at another library. To take advantage of what libraries have to offer, then, you must *plan* your search. Fortunately, this is where libraries—and librarians—are most useful.

Knowing where to begin your search can be overwhelming at first. It is tempting to simply search a few terms and see what comes up. We do this too, but we also know that the library offers more systematic and productive methods for discovering useful and credible sources. Use the library to learn more about your topic and about promising avenues for exploring your research question.

Ask a Librarian. Perhaps the best advice we can offer is to rely on the research expertise of librarians. Both general reference librarians and (in larger libraries) subject area specialists can help you refine your search parameters and direct you to the right tools for your specific research question. They can help you use the catalog to locate materials held by your library or by other libraries (and obtainable through interlibrary loan). These same librarians typically design research guides that identify reference works and online databases for specific fields.

And don't be shy. Librarians love to assist researchers of all levels and at all stages of the research process. They can help you formulate your research question and plan, develop search terms, and inventory your results to ensure you haven't overlooked something of value. The only embarrassing question is the one you *failed to ask* but should have. Of course, it pays to meet busy librarians halfway by preparing in advance. If you have a well-developed research question ready to share, your librarian will be able to give you better advice. You might describe your project using the three-step rubric from [chapter 3](#):

I am working on educational policy in the 1980s

to find out how school boards in the Midwest dealt with desegregation,

because I want to understand regional differences in race relations.

Consult Reference Works. If you already know a lot about your topic, you probably also know how to find sources on it. But if you are new to a topic, resist the temptation to go straight to primary or secondary sources that strike you as relevant. This approach is unreliable and unpredictable and probably won't save you any time. A more successful strategy is to allow reference works to shape your search efforts. Compiled by experts, both general reference works such as the *Encyclopaedia Britannica* and more specialized works such as the *Encyclopedia of Philosophy* will give you the lay of the land, so that later it will be easier to see how your sources fit within the bigger picture. In addition, reference works often include citations or bibliographies that can lead you to sources you might otherwise overlook.

Especially valuable at early stages of research are bibliographic works, many of which provide abstracts summarizing significant articles or books on a topic. Look, especially, for annotated bibliographies or annual literature reviews that sum up recent books or articles; these offer the most promising leads for your research.

Explore Online Databases. What sets libraries apart from the Internet are their subscriptions to indexes and databases. After books, these are arguably a library's most valuable assets, since they give researchers access to materials they could not obtain otherwise. Each library's subscriptions will differ, with major research libraries offering the most comprehensive access to specialized indexes and databases. However, every academic library and many public libraries offer a powerful set of online tools that greatly

extend their actual collections. You will certainly want to make use of these general and specialized resources in your research. At least become familiar with the major databases to which your library subscribes, such as Academic Search Premier, MLA International Bibliography, or PubMed. Many academic databases either provide abstracts or direct you to articles that include abstracts. Looking at these can help you decide if an article itself is worth reading carefully. Some databases allow you to access full-text articles and even books. But be aware: If your library does not subscribe to a particular journal included in a database, you might be asked to pay a fee to access a full-text article. Before doing so, *always* speak with a librarian about other means of access.

5.2.2 Finding Specific Sources

Having identified a range of search strategies and resources, you are now in a position to look for specific sources in and beyond the library. Of course, this process is not strictly linear. A single source can lead to others and return you to catalogs and databases you have already visited, only this time with new search terms. Novice researchers often rely too heavily on only a few terms or on terms that prove to be too broad—or narrow—to call up relevant sources. Successful researchers know they have to be flexible: searches typically involve trial and error to discover those terms that will yield the most relevant sources.

Search Your Library Catalog. In your research, you will probably need to use your library's catalog in two complementary ways: keyword searching and browsing. When you have examined some sources to identify a list of *keywords* associated with your topic, you are ready to use these terms to search the catalog. In most libraries, you must choose the category (books, articles, journals, etc.) you wish to use for your search.

If your sources include books, you can use Library of Congress subject headings, found either on the back of their title page or on their “details” page in the online catalog, to search for related materials. On the back of this book's title page are the terms

1. Research—Methodology.
2. Technical writing.

If you search an online catalog for those terms, you will find all the books on those subjects in that library. A book may be cross-listed under multiple subject headings. In that case, take a quick look at the titles listed under those headings as well. You may find

useful sources you would have missed otherwise. You can also *browse* the catalog for books with similar *call numbers*. Once you identify a book that seems on target, use its call number to find others shelved along with it. Look for the browse link in your book's catalog entry. This list will be less focused than a keyword list, but it may also contain unexpected gems. So don't restrict yourself to books nearest your target. Invest the time to browse widely.

The problem with any online search is that it may produce an overwhelming number of titles. The University of Chicago library has more than three hundred books on Napoleon and thousands with the word *environment* in their titles. If your search turns up too many sources, narrow it down. Today's online catalogs let you limit searches in many ways: by date of publication, language, subject, resource type (books, articles, databases, etc.), and possibly others depending on the catalog. If you can't decide how to narrow your search, start with the date of publication. Restrict it to those sources published in the last fifteen years; if that still turns up too many, cut to the last ten years.

After you search the Library of Congress or a large university catalog, you may discover that your own library holds only a fraction of what you found, but that it can borrow most of what you need. For books too new to be in a library catalog but crucial to your research, find an online bookseller. Those books might turn up on your library's new acquisitions shelf, and you can always recommend books to your library for acquisition. But if you need those books quickly, you'll probably have to buy them.

On the other hand, if you find nothing, your topic may be too narrow or too far off the beaten track to yield quick results. But you could also be on to an important question that nobody else has thought about, at least not for a while. For example, "friendship" was once an important topic for philosophers, but it was then ignored by major encyclopedias for centuries. Recently, though, it has reemerged as a topic of serious research. Chances are you'll make something of a neglected topic only through your own hard thinking. In the long run, that research might make you famous, but it probably won't work for a paper due in a few weeks.

Prowl the Stacks. Doing research online is faster than on foot, but if you never go into the stacks of your library (assuming you're allowed to), you may miss crucial sources that you'll find only there. More important, you'll miss the benefits of serendipity—a chance

encounter with a valuable source that occurs only when a title happens to catch your eye. (All of us have found important sources in this way.)

If you can get into the stacks, find the shelf with books on your topic, then scan the titles on that shelf, then on the ones above, below, and on either side, especially for books with new bindings published by university presses. Then turn around and skim titles behind you; you never know. When you spot a promising title, skim its table of contents and index for keywords related to your question and answer. Then skim its bibliography for titles that look relevant. You can do all that faster with a book in your hand than you can online. Be suspicious of a book with no index or bibliography. (See 5.4 for more on systematic skimming.)

You can check tables of contents for most journals online, but browsing among shelved journals can be more productive. Once you identify promising journals online or in bibliographies, find them on the shelf. Skim the bound volumes for the last ten years (most have an annual table of contents in front). Then take a quick look at journals shelved nearby. You'll be surprised how often you find a relevant article that you would have missed online.

Follow Bibliographic Trails. Most sources will give you trailheads for bibliographical searches. When you find a book that seems useful, skim its bibliography or works cited. Its index will list the authors cited most often (generally, the more citations, the more important an author is). Journal articles usually begin with a review of previous research, all cited. By following this bibliographic trail, you can navigate the most difficult research territory, because one source always leads to others, which lead to others, which lead to . .

Use Citation Indexing. Many online catalogs and databases let you look up *other* sources that cite one that you already know. This technique, called citation indexing, is like following a bibliographic trail, forward or backward. Instead of searching for sources that a given source cites, *backward* citation, you can search for sources that cite a given source, or *forward* citation. A source's credibility can thus be gauged both by the sources it cites and by the sources that cite it. The more a given source is later cited, the greater its reputation and its impact factor.

To do this kind of research, researchers used to have to consult printed citation indexes, a process that could take hours or even days. But today's online catalogs and

databases make it easy. By following bibliographic trails and using citation indexing in tandem, you can build up a rich network of sources to support your own research.

5.3 LOCATING SOURCES ON THE INTERNET

You probably already know how to search the publicly available Internet: type a few words into the text box of a public search engine like Google, and pages of links—delivered as URLs, or uniform resource locators—arrive on your screen. We use this technique all the time, to find movie times, restaurant reviews, stock prices, news items, and so on. Its ubiquity in our everyday lives is reflected in our language. We've turned the name of a company into a verb: in everyday parlance, to "Google" something is to search for it.

Your practical experience with such everyday research might lead you to regard the Internet as comprehensive and reliable. (You use it to price a smartphone or pair of jeans, so why not for your academic or professional research?) But that would be a mistake. Again, remember that your library's catalogs and databases will allow you to access a great deal of information that you cannot get through a search engine. When using the Internet for research, maintain a healthy skepticism: most of what we retrieve using Google or some other search engine is perfectly reliable, but not everything is. In contrast to your library's catalogs and databases, the Internet is essentially unmonitored. There is no one to vouch for the credibility of materials posted to, and sent from, countless websites. And finally, keep in mind that companies offering free search engines make their money by acquiring data about you through your online behavior and by selling advertising, and that webmasters routinely modify their sites to make them appear higher in search results. These practices are not necessarily nefarious, but you should remember that search engine companies and websites themselves have an interest in where you go and what you see online.

But if you keep these limitations in mind, using the Internet can be a valuable component of your research plan. Here are some ways in which we use the Internet in our own research:

- To get our bearings with respect to a new topic—regarding everything we learn at this stage as provisional

- To explore potential keywords to use in a more systematic search

To remind ourselves of dates or facts—again remembering to check these against more reliable sources

To locate the authors of sources whom we might wish to contact: profiles of many scholars and researchers are available on college and university websites

To get a “ballpark” sense of what we are likely to find through a search of specialized databases by a quick search using Google Scholar

Publicly available general tertiary sources such as *Wikipedia* and specialized ones such as the Victorian Web are often quite reliable. But you should still view them skeptically. In general, don’t use the Internet to find secondary sources, as these depend for their credibility on the checks inherent in the academic publishing system, especially that of peer review. You can, however, use the Internet freely as a primary source. For example, if you study how soap opera story lines respond to their fans’ reactions, fan blogs would be fine primary sources. (We discuss evaluating sources in the next section.)

Respecting Authors’ Rights. Sites such as Project Gutenberg and Google Books can provide reliable online copies of older texts no longer in copyright. But postings of more recent texts (in the United States, those published in 1923 or later) may violate the author’s copyright. Careful readers dislike seeing unauthorized copies cited not only because that breaks the law but also because such texts are often inaccurately reproduced. So unless a recent text is posted with the author’s clear permission (as in a database), use its print rather than its e-version.

5.4 EVALUATING SOURCES FOR RELEVANCE AND RELIABILITY

When you start looking for sources, you'll find more than you can use, so you must quickly evaluate their usefulness. To do so use two criteria: relevance and reliability.

5.4.1 Evaluating Sources for Relevance If your source is a book, do this:

Skim its index for your keywords, then skim the pages on which those words occur.

Skim the first and last paragraphs in chapters that use a lot of your keywords.

Skim prologues, introductions, summary chapters, and so on.

Skim the last chapter, especially the first and last two or three pages.

If the source is a collection of articles, skim the editor's introduction.

Check the bibliography for titles relevant to your topic.

If your source is an e-book, you should still follow these steps, but you can also search the whole text for your keywords.

If your source is an article, do this:

Read the abstract, if it has one.

Skim the introduction and conclusion; or if they are not marked off by headings, skim the first six or seven paragraphs and the last four or five.

Skim for section headings, and read the first and last paragraphs of those sections.

Check the bibliography for titles relevant to your topic.

If your source is online, do this:

If it looks like a printed article, follow the steps for a journal article, and also search on your keywords.

Skim sections labeled "introduction," "overview," "summary," or the like. If there are none, look for a link labeled "About the Site" or something similar.

If the site has a link labeled “Site Map” or “Index,” check it for your keywords and skim the referenced pages.

- If the site has a “search” resource, type in your keywords.

This kind of speedy reading can guide your own writing and revision. If you do not structure your paper so your readers can skim it quickly and see the outlines of your argument, your paper has a problem, an issue we discuss in chapters [12](#) and [13](#).

5.4.2 Evaluating Sources for Reliability

You can’t judge a source until you read it, but there are signs of its reliability:

Is the source published or posted online by a reputable press? Most university presses are reliable, especially if you recognize the name of the university. Some commercial presses, which are presses not associated with a university, are reliable in some fields, such as Norton in literature, Ablex in sciences, or West in law. Be skeptical of a commercial book that makes sensational claims, even if its author has a PhD after his name. Be especially careful about sources on hotly contested social issues such as stem-cell research, gun control, and global warming. Many books and articles are published by individuals or organizations driven by ideology. Libraries often include them for the sake of coverage, but don’t assume they are reliable.

Was the book or article peer-reviewed? Most reputable presses and journals ask experts to review a book or article before it is published; this is called peer review. Essay collections published by university presses are often but not always peer-reviewed; sometimes they are reviewed only by the named editor or editors. Few commercial magazines use peer review. If a publication hasn’t been peer-reviewed, be suspicious.

Is the author a reputable scholar? This is hard to answer if you are new to a field. Most publications cite an author’s academic credentials; you can find more with a search engine. Most established scholars are reliable, but be cautious if the topic is a contested social issue such as gun control or abortion. Even reputable scholars can have axes to grind, especially if their research is financially supported by a special interest group. Go online to check out anyone an author thanks for support, including foundations that supported her work.

If the source is available only online, is it sponsored by a reputable organization? A website is only as reliable as its sponsor. You can usually trust

one that is sponsored and maintained by a reputable organization. But if the site has not been updated recently, it may have been abandoned and may no longer be endorsed by its sponsor. Some

sites supported by individuals are reliable; most are not. Do a web search for the name of the sponsor to find out more about it.

Is the source current? You must use up-to-date sources, but what counts as current depends on the field. In computer science, a journal article can be out-of-date in months; in the social sciences, ten years pushes the limit. Publications have a longer shelf life in the humanities: literary or art criticism, for example, can remain relevant for decades and even centuries. In general, a source that sets out a major position or theory that other researchers accept will stay current longer than those that respond to or develop it. Assume that most textbooks are *not* current. If you are unsure whether a source will be considered current, take your lead from the practice of established researchers in the field. Look at the dates of articles in the works cited lists of a few recent books or articles in the field: a good rule of thumb is that you can cite works as old as the older ones in that list (but to be safe, perhaps not as old as the oldest). Try to find a standard edition of primary works such as novels, plays, letters, and so on: it is usually not the most recent. Be sure that you consult the most recent edition of a secondary or tertiary source: researchers often change their views, even rejecting ones they espoused in earlier editions.

If the source is a book, does it have notes and a bibliography? If not, be suspicious, because you have no way to follow up on anything that the source claims.

If the source is a website, does it include bibliographical data? You cannot judge the reliability of a site that does not indicate who sponsors and maintains it, who wrote what's posted there, and when it was posted or last updated.

If the source is a website, does it approach its topic judiciously? Your readers are unlikely to trust a site that engages in heated advocacy, attacks those who disagree, makes wild claims, uses abusive language, or makes errors of spelling, punctuation, and grammar.

The following criteria are particularly important for advanced students:

If the source is a book, has it been well reviewed? Many fields have indexes to published reviews that tell you how others evaluate a source (see our “Appendix: Bibliographic Resources”).

Has the source been frequently cited by others? You can roughly estimate how influential a source is by how often others cite it. Citation indexing makes this easy to do (see 5.2.2). If you find that a source is cited repeatedly by other scholars, you can infer that experts in the field regard it as reliable and significant. Such sources are said to have a high

“impact factor.” You should keep an eye out for such sources and use them to orient yourself in your field of research.

Whom Can You Trust?

The highly respected *Journal of the American Medical Association* appointed a committee to review articles published by reputable journals for reliability. Even though those papers had been approved by experts in the field, the reviewers reported that “statistical and methodological errors were common” (“When Peer Review Produces Unsound Science,” *New York Times*, June 11, 2002, p. D6). In the face of such revelations, some just dismiss what scientists publish: if the reviewers of scientific articles can’t guarantee reliable data, what is a mere layperson to do? You do what we all do—the best you can: read critically, and when you report data, do so as accurately as you can. We’ll return to this question in [chapter 8](#).

Error is bad, but dishonesty is worse. One of Booth’s students got a summer job with a drug company and was assigned to go through stacks of doctors’ answers to questionnaires and shred certain ones until nine out of ten of those left endorsed the company’s product. These bogus data were then used to “prove” that the product worked. The student quit in disgust and was, no doubt, replaced by someone less ethical.

These indicators do not guarantee reliability. Reviewers sometimes recommend that a reputable press publish something weakly argued or with thin data because other aspects of its argument are too important to miss—we have each done so. So don’t assume that you can read uncritically just because a report is written by a reputable researcher and published by a reputable press.

5.5 LOOKING BEYOND PREDICTABLE SOURCES

For a class paper, you'll probably use the sources typical in your field. But if you are doing an advanced project, an MA thesis, or a PhD dissertation, search beyond them. If, for example, your project were on the economic effects of agricultural changes in late sixteenth-century England, you might read Elizabethan plays involving country characters, look at wood prints of agricultural life, find commentary by religious figures on rural social behavior. Conversely, if you were working on visual representations of daily life in London, you might research the economic history of the time and place. When you look beyond the standard *kinds* of references relevant to your question, you enrich not only your analysis but your range of intellectual reference and your ability to synthesize diverse kinds of data, a crucial competence of an inquiring mind. Don't ignore a work on your topic that is not mentioned in the bibliographies of your most relevant sources—you will get credit for originality if you turn up a good source that others have ignored.

When They Beat You to the Punch

Don't panic if you find a source that seems to pose and solve precisely your problem: "Transforming the Alamo Legend: History in the Service of Politics." At that moment you might think, *I'm dead. Nothing new to say.* (It happened to Williams when he was writing his doctoral dissertation and to Colomb just before his first book came out.) You may be right, but probably not. If the source does in fact settle your exact question, you have to formulate a new one. But the question your source asked is probably not as close to yours as you first feared. And you may find that you can do the source one better: if the author failed to get things entirely right, you have an unwitting ally in formulating your problem.

5.6 USING PEOPLE TO FURTHER YOUR RESEARCH

One of the paradoxes of twenty-first-century research is that even as new technologies allow us to access an unprecedented wealth of materials with unprecedented ease, research has also become more personal. So as you undertake your project, don't forget about the human element.

Most obviously, people can be sources of primary data, collected through observation, surveys, or interviews. Be creative when using people for primary research: don't ignore people in local business, government, or civic organizations. For example, if you were researching school desegregation in your town, you might go beyond the documents to

ask the local school district whether anyone there has memories to share. We can't explain the complexities of interviewing (there are many guides to that process), but remember that the more you plan by determining *exactly* what you want to know, the more efficiently you will get what you need. You don't need to script an interview around a set list of questions—in fact, that can be a bad idea if it makes the interviewee freeze up. But prepare so that you don't question your source aimlessly. You can always reread a book for what you missed, but you can't keep going back to people because you didn't prepare well enough to get what you needed the first time. And always remember that when conducting primary research that involves people, you must adhere to rigorous ethical standards (see the Quick Tip at the end of this chapter).

People can also lead you to good secondary sources or serve as such sources themselves. We noted earlier that the body of secondary sources on a topic constitutes the scholarly “conversation” about it. That was a metaphor. But you can and should have real conversations about your research as well. Above we encouraged you to discuss your research with one kind of expert: your reference librarian. Your librarian is an expert on the processes of library research. You can also benefit from talking directly with experts on your topic. Ask them about the important open questions in the field. Ask them what they think of your project or provisional thesis. Ask them to suggest secondary sources for you to read. This kind of personal guidance can be invaluable to a novice researcher, and many experts will be happy to talk with you (or at least engage in a little e-mail correspondence).

All of us have made these kinds of queries with great success in our own research, and all of us have responded to them in turn, by helping those who have contacted us. One of us once invited an eminent scholar to talk about his research process to a group of first-year college students. He began his talk by saying, “I don't really have a research process; I just ask my smart friends what I should read.” This scholar was being at least a bit tongue in cheek, but we could all do worse than to rely on such smart friends, at least to get us started.

Quick Tip: The Ethics of Using People as Sources of Data

In recent years we have become increasingly aware that research using people may inadvertently harm them—not just physically but by embarrassing them, violating their privacy, and so on. So every college or university now has a committee that reviews all research directly or indirectly involving people, whether done by students or professional researchers. These committees go by different names—Human Subjects Committee, Institutional Review Board, Ethics Research Board, and so on—but they all aim to ensure that researchers follow the maxim that should govern research as it does medicine: *Do no harm*. Consult with that committee if you use people as sources of data—whether by interviewing, surveying, perhaps even just observing them. Jumping through these hoops may feel like bureaucratic make-work, but if you don't, you could harm those who help you and may even damage your institution.

6 Engaging Sources

To make your research reliable, you must use your sources fairly and accurately. In this chapter, we explain how to engage your sources productively and how to take notes so that readers can trust you when you rely on or critique a source.

In this chapter, we show you how to get the most out of your sources, especially your secondary sources. We've chosen that focus for a simple reason: it's a topic on which we can offer useful, general advice. The ways that researchers find or create their data, and the kinds of data readers expect as evidence, vary wildly from field to field. Historians and literary critics typically comb primary sources for passages they can use as evidence. Other researchers, however, don't use primary sources at all: depending on their fields, they might analyze soil samples in a lab, or conduct a survey, or build a computer model. But every field has its body of secondary sources, sometimes called its *literature*, that document the field's conversation. And researchers in all fields engage these sources in similar ways.

How you use your secondary sources depends on where you stand in your search for a project. Experienced researchers read secondary sources regularly to keep up with work in their fields, and so they usually begin their projects with a question or problem in mind. But if you are new to a subject or you still have only a topic, you may have to read a lot of sources to find a problem to pursue, and then even more to figure out how to solve it. In this chapter, we show you how to read secondary sources as experienced researchers do: not just for data you can use in your own argument but more importantly for questions, problems, and arguments that spur your own thinking.

6.1 RECORDING COMPLETE BIBLIOGRAPHICAL INFORMATION

First things first: once you decide a source is worth reading, record *all* of its bibliographical information. Do this before you do anything else: it only takes a moment, and we promise that no habit will serve you better for the rest of your career.

You need the bibliographic information for your sources not only so that you can recall what you have read, but also so that you can credit your sources when you write. In your own notes, you can record bibliographic data in whatever format you like—so long as your records are complete; when you cite sources in your writing, you should follow the citation style of your field (see 14.5).

For printed books, record

author(s)

title (including subtitle)

editor(s) and translator(s) (if any)

edition

volume

place published (only the first city if more than one is listed)

publisher

date published

page numbers of articles or chapters consulted

library call number (if any)

ISBN

For electronic books, record everything you would record for a printed book plus

URL (if any)

name of database (if any)

date of access

electronic format of the book

For journal articles, record

author(s)

title (including subtitle) of article

title of journal

volume and issue number

date

page numbers of article

library call number (if any)

For online sources, record as much of the above as applies. Also record

URL

name of database (if any)

date of access

Webmaster (if identified)

If you access a printed text online, record bibliographical data from the original printing as well as your source of online access.

If you scan or photocopy a passage from a book, also scan or photocopy its title page and the bibliographic information on the reverse side. Then add the library call number if you know it. You won't need to include the call number when you cite the source, but knowing it will allow you to find the source again easily if you need it.

You may think this advice is overly cautious, but it isn't. Nothing is more frustrating than having the perfect quotation or bit of data in your notes and being unable to use it in your writing, because you didn't completely document your source and can't find it again.

Williams once had to withhold a publication on Elizabethan social history for more than a year because he failed to document a source fully. Years earlier he had come across some data—a list of renters in London in 1638—he thought he would someday find useful. But he had failed to record complete information on his source, so when that day came, he could not use its data. He searched the library

at the University of Chicago for hours, until one night he sat up in bed, realizing that the source was in a different library!

6.2 ENGAGING SOURCES ACTIVELY

Experienced researchers don't read passively; they engage their sources actively, entering into conversation with them. If you can, read important sources twice. First, read generously. Pay attention to what sparks your interest. Reread passages that puzzle or confuse you. Don't look for disagreements right away, but read in ways that help the source make sense. Otherwise, you'll be tempted to emphasize its weaknesses if it presents an argument that rivals yours. Resist that temptation, at least at first.

Then, if your source seems important or seems to challenge your own position, read it a second time slowly and more critically. When you read a passage, think not only about what it says but about how you would respond. Record those responses in your notes or—if you own the source or are working from a copy—in the margins of the source itself. Test your understanding by summarizing: if you can't sum up a passage in your mind, you don't understand it well enough to disagree.

Don't accept a claim just because an authority asserts it. For decades, researchers cited the "fact" that the Inuit people of the Arctic had many terms for types of snow. But another researcher found that they have just three (or so she claims). And understand that experts frequently disagree. If Expert A says one thing, B will assert the opposite, and C will claim to be an expert but is not. When some students hear experts disagree, they become cynical and dismiss expert knowledge as just opinion. But don't mistake informed and thoughtful debate over legitimately contested issues for mere opinion. In fact, it's the mark of an active field.

If you are an advanced researcher, check the accuracy of everything important to your argument. Researchers whose work has been used by others will tell you, as often as not, that it was reported inaccurately, summarized carelessly, or criticized ignorantly. Writers regularly write to the *New York Review of Books* and the "Book Review" of the *New York Times*, pointing out how reviewers distorted their ideas or made factual errors criticizing them.

Check—and Check Again

Researchers rarely misrepresent sources deliberately, but they are occasionally careless or intellectually lazy. Colomb heard a prominent researcher confess after her talk that she had never read the work she had just discussed. One of Booth's books was "refuted" by a critic who apparently read only the title of a section, "Novels Must Be Realistic." Failing to read beyond it, he didn't know that Booth himself was attacking the claim in the title, along with other misconceptions about fiction. One reviewer of a book by Williams misquoted him and then, thinking he was disagreeing with him, argued for the point Williams made in the first place!

6.3 READING FOR A PROBLEM

Once you have a research problem, use it to guide your search for evidence, models, and arguments to respond to. But if you don't yet have one, you won't know which data, models, or arguments might be relevant. So read sources not randomly but deliberately to find a problem. Look for claims that seem puzzling, inaccurate, or simplistic—anything you can disagree with. You're more likely to find a research problem when you disagree with a source, but you can also find one in sources you agree with.

6.3.1 Look for Creative Agreement

If you believe what a source claims, try to extend that claim: What new cases might it cover? What new insights can it provide? Is there confirming evidence the source hasn't considered? Here are some ways to find a problem through creative agreement.

Offer additional support. You can offer new evidence to support a source's claim.

Smith uses anecdotes to show that the Alamo story had mythic status beyond Texas, but editorials in big-city newspapers offer better evidence.

Source supports a claim with old evidence, but you offer new evidence.

Source supports a claim with weak evidence, but you offer stronger evidence.

Confirm unsupported claims. You can prove something that a source only assumes or speculates about.

Smith recommends visualization to improve sports performance, but MRI studies of the mental activities of athletes offer evidence that shows why that is good advice.

Source speculates _____ might be true, but you offer evidence to show that it is.

Source assumes _____ is true, but you can prove it.

Apply a claim more widely. You can extend a position.

Smith argues that medical students learn physiological processes better when they are explained with many metaphors rather than with just one. The same seems true for engineering and law students.

Source correctly applies _____ to one situation, but you apply it to new ones.

Source claims that _____ is true in a specific situation, but you show it's true in general.

6.3.2 Look for Creative Disagreement

If you read actively, you'll inevitably find yourself disagreeing with your sources. Don't brush those disagreements aside, because they often point to new research problems. Look for these types (the list is not exhaustive, and some kinds overlap):

Contradictions of kind. A source says something is one kind of thing, but it's another.

Smith says that graffiti is merely vandalism, but it is better understood as a form of public art.

Source claims that _____ is a kind of _____, but it's not.

Source claims that _____ always has _____ as one of its features or qualities, but it doesn't.

Source claims that _____ is normal/good/significant/useful/moral/interesting, but it's not.

You can reverse those claims and the ones that follow to state the opposite:

Though a source says _____ is *not* a kind of _____, you can show that it is.

Part-whole contradictions. You can show that a source mistakes how the parts of something are related.

Smith has argued that coding is irrelevant to a liberal education, but in fact, it is essential.

Source claims that _____ is a part of _____, but it's not.

Source claims that one part of _____ relates to another in a certain way, but it doesn't.

Source claims that every _____ has _____ as one of its parts, but it doesn't.

Developmental or historical contradictions. You can show that a source mistakes the origin or development of a topic.

Smith argues that the world population will rise, but it won't.

Source claims that _____ is changing, but it's not.

Source claims that _____ originated in _____, but it didn't.

Source claims that _____ develops in a certain way, but it doesn't.

External cause-effect contradictions. You can show that a source mistakes a causal relationship.

Smith claims that legalizing marijuana will increase its use among teenagers, but evidence shows that it doesn't.

Source claims that _____ causes _____, but it doesn't/they are both caused by _____.

Source claims that _____ is sufficient to cause _____, but it's not.

Source claims that _____ causes only _____, but it also causes _____.

Contradictions of perspective. Most contradictions don't change a conceptual framework, but when you contradict a "standard" view of things, you urge others to think in a new way.

Smith assumes that advertising has only an economic function, but it also serves as a laboratory for new art forms.

Source discusses _____ from the point of view of _____, but a new context or point of view reveals a new truth [the new or old context can be social, political, philosophical, historical, economic, ethical, gender specific, etc.].

Source analyzes _____ using theory/value system _____, but you can analyze it from a new point of view and see it in a new way.

6.4 READING FOR ARGUMENTS

6.4.1 Read for Arguments to Respond To

No argument is complete until it acknowledges and responds to its readers' predictable questions and disagreements. You can find some of those competing views in secondary sources. What alternatives to your claims do they offer? What evidence do they cite that you must acknowledge? Some new researchers think that they weaken their case if they mention any views opposing their own. The opposite is true. When you acknowledge the views of others, you show that you not only know those views, but have carefully considered and can confidently respond to them (for more on this, see [chapter 10](#)).

Experienced researchers also use those competing views to improve their own. You can't really understand what you think until you understand why a rational person might think differently. So as you look for sources, don't look just for those that support your claims. Be alert for sources that contradict them, because they are sources that your readers are likely to know.

6.4.2 Read for Models of Reasoning and Analysis

You can use secondary sources in another way as well: as models of reasoning and analysis. If you have never made an argument like the one you plan to, you might follow the pattern of other arguments that you find in your secondary sources. You can't use specific ideas (that would be plagiarism), but you do not plagiarize a source when you borrow its ways of arguing or of analyzing data. (Don't worry that using a source as a model will make your research seem unoriginal. Research arguments are often unoriginal in their methods and ways of reasoning. Readers will look for originality in your problem, claim, and evidence.)

Suppose you want to argue that the Alamo legend thrived because it served the political interests of those who created it and satisfied the emotional needs of those who repeated it. You will need reasons and evidence unique to your claim, but you can raise the *kinds* of issues that readers see in similar arguments about other legends, real or fictional. If, for example, a source shows how the King Arthur legend helped to shape English society and politics, you might make a similar argument about the Alamo and the Republic of Texas. You are not obliged to cite your model, but to gain credibility, you might note that it makes an argument similar to yours:

Just as the Arthurian legends helped to forge a definitively English social and political identity (Weiman 1998), so the legend of the Alamo . . .

6.5 READING FOR DATA AND SUPPORT

Analysis of Logic.

Analysis of Grammar.

Discourse Analysis of The Text

A. Use the Following Books for Discourse Analysis:

- Critical Discourse Analysis_ The Critical Study of Language.
- Discourse analysis.
- The Routledge handbook of discourse analysis.

6.5.1 Read for Data to Use as Evidence

New researchers regularly mine secondary sources for data, but if you can, check the primary source. If an important quotation is available in its original form and context, it is risky and intellectually lazy not to look it up. You don't have to agree with a source to use its data; in fact, its argument does not even have to be relevant to your question, so long as its data are. However, use statistical data only if you can judge for yourself whether they were collected and analyzed appropriately. (You serve yourself well if you take a course or two in statistics and probability, an area where most Americans are shamefully ignorant.)

6.5.2 Read for Claims to Use as Support

Researchers often use the results they find in secondary sources to bolster their own arguments. If you find a useful claim, you can cite it to support your own, especially if it has been well supported and widely accepted. But many claims show nothing more than that another researcher agrees with you. To use such claims as evidence, you have to report not only the conclusion of the source but its reasoning and supporting evidence as well.

6.6 TAKING NOTES

Once you find a source that you think you can use, you must read it purposefully and carefully. But that will do you little good if you can't locate it again or remember it well enough to use. So again, before you do anything else, record the source's full bibliographic information. Then take notes in a way that will help you not only to remember and use what you have read but also to further your own thinking.

You can take notes on index cards or in a notebook, or you can use your computer or handheld device. You can even take notes online, using any number of web-based solutions, from word processors to elaborate reference-management systems. Each of these approaches has its advantages and disadvantages. You need to understand them and pick the approach that will work best for you.

6.6.1 Taking Notes on Paper

Years ago, the standard way to take notes on sources was to create a file of index cards: At the top left is the author, short title, and page number. At the top right are keywords that let the researcher sort and re-sort notes into different categories and orders. The body of

the card summarizes the source, records a direct quotation, and includes a comment or thought about further research that is clearly distinguished from the quotation. At bottom left is the call number of the source.

Although few researchers use this method extensively today, we can still learn important principles from it:

Record complete bibliographic information for each source so that you can cite it properly and find it again easily.

Separate notes on different topics: don't jumble together your notes on different topics, even if they come from the same source.

Make sure your notes are accurate, because you need to be able to rely on them later. (If you want to quote more than a few lines, consider photocopying, scanning, or cutting-and-pasting the passage, or simply saving the whole document.)

Perhaps most important: clearly distinguish (1) what you quote from a source, (2) what you paraphrase or summarize from a source, and (3) your own thoughts. If you are writing on paper, use headings or brackets or different colors of ink to differentiate these different kinds of note. If you are using a computer or taking notes online, use different fonts or different colors of type. We stress that you must *unambiguously* distinguish your own words from those of your sources because it is so easy to confuse the two.

Compared to computer files, paper notes can be cumbersome to store, back up, index, and access, and they are susceptible to transcription errors: when hand-copying quotations, it is surprisingly easy to alter their wording, even when you think you are being careful. Still, paper notes have their uses. For example, a notebook or pack of index cards is cheap and portable, and paper can sometimes go where technology cannot—some archives still require patrons to take notes with paper and pencil. The main reason some researchers still rely on paper notes is that they help with thinking. Since you can't write out everything, using paper forces you to think about what's most important. Likewise, if your notes are on cards or sheets of paper, you can group them, shuffle them, or lay them out on a desk, a table, or even the floor. And the very act of *writing out* your notes can help you not only remember what's in them but also see connections and develop your own ideas. Still, few researchers today rely on paper notes alone. Most use their computers.

6.6.2 Taking Notes on a Computer

When you take notes using a computer, you have several options:

Most simply, you can use a word processor. Create a separate file (or at least a separate page) for each source, and be sure to unambiguously distinguish your own words from those of your source. Word processors are easy to use, but they also limit your ability to index, organize, sort, and search your notes. So for long or complex projects especially, you may want to consider other options.

You can use a dedicated note-taking application to create and organize your notes for a project. Such applications can help you to index, sort, and access your notes, but since they sometimes use proprietary formats, they can make it difficult for you to share your notes or use them with other programs.

You can use a full reference-management system. Such systems do much more than help you organize and access your notes. They can often pull information directly from online library catalogs and databases, and they can format and update your citations and bibliographies when you write. Some will even store full electronic copies of your sources within the reference management system, helping you build and maintain your personal library of sources. But like note-taking programs, these systems sometimes use proprietary formats, and you have to learn to use them.

All three types of application are also available in web-based versions, meaning that the application and your notes reside not on your own computer but in the “cloud.” This protects your data from inadvertent loss or corruption (you don’t have to worry about your hard drive crashing) and can help you share information and collaborate with other researchers.

But whatever technology you use, you have to consider some basic questions:

How will you stay organized? For example, if you plan to create a separate word-processing document for each source, you then need a system for naming and storing your files. Without such a system, it is very easy to “lose” your notes on your hard drive.

How will you use your notes? You may decide to store your notes differently for small projects and large ones, for discrete projects and ongoing ones, for individual projects and collaborative ones.

What applications are available through your school or library? Many schools offer note-taking or reference-management systems to faculty and students, sometimes integrating these tools with their catalogs. If your school offers such resources, consider using them.

Most important: what approach best suits your own ways of writing, thinking, and working? As you grow as a writer and researcher, you will develop ways of working that are particular to you. Others may find them cumbersome or confusing or even incomprehensible. No matter. Remember that your goal is not to create an elaborate set of notes but to research and write capably and intelligently. If a piece of software doesn't help you do that, it isn't useful—to you.

6.6.3 Decide Whether to Quote, Paraphrase, or Summarize

If you can photocopy, scan, or download your source, or you know that you can access it online when you write, you can focus less on preserving its exact words than on your own engagement with it. That's a great advantage. Summarize the source, which will also help you understand it, and note passages you may want to quote or paraphrase when you write. Note also your own responses to the source. Where did you find yourself agreeing with it? Disagreeing? Wanting to say, *Yes, but . . .* ?

If you can't preserve your source and you don't know whether you will be able to access it later, you have a tougher choice. It takes too long to transcribe the exact words of every passage that's interesting or potentially useful, but it's a nuisance when you realize later that you want to quote something you only summarized. So when taking notes, you must choose as you go whether to quote, paraphrase, or summarize. In general, researchers in the humanities quote most often; social and natural scientists usually paraphrase and summarize. But every choice depends on how you plan to use your source:

Summarize when you need only the point of a passage, section, or even whole article or book. Summary is useful for context or views that are related but not specifically relevant. A summary of a source never serves as good evidence.

Paraphrase when the specific words of a passage are less important than its meaning. Paraphrasing doesn't mean changing just a word or two. You must

replace most of the words and phrasing of the original with your own. A paraphrase is never as good evidence as a direct quotation.

Record exact quotations for these purposes:

—The quoted words are evidence that backs up your reasons. If, for example, you claimed that different regions responded to the Battle of the Alamo differently, you would quote exact words from different newspapers. You would paraphrase them if you needed only their general sentiments.

—The words are from an authority you plan to rely on or challenge. —The words are strikingly original or so compelling that the quotation can frame the rest of your discussion.

—The source makes a claim that you disagree with, and to be fair you want to state that claim exactly.

Never abbreviate a quotation thinking you can accurately reconstruct it later. You can't. And if you misquote, you'll undermine your credibility.

6.6.4 Get the Context Right

Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context?

You can't record *everything*, but you have to record *enough* to ensure that you accurately capture the source's meaning. As you use material from your sources, record not just what they say but how they use the information.

When you quote, paraphrase, or summarize, be careful about context. You cannot entirely avoid quoting out of context, because you cannot quote all of an original. So when you draft a paraphrase or summary or copy a quotation, do so within the context that matters most—that of your own grasp of the original. When you record a part of an argument, note the line of reasoning that the author was pursuing:

NOT: Bartolli (p. 123): The war was caused by Z.

NOT: Bartolli (p. 123): The war was caused by X, Y, and Z.

BUT: Bartolli: The war was caused by X, Y, and Z (p. 123). But the most important cause was Z (p. 123), for three reasons: reason 1 (pp. 124–26); reason 2 (p. 126); reason 3 (pp. 127–28).

Sometimes you will care only about the conclusion, but readers usually want to see how a conclusion emerges from the argument supporting it. So when you take notes, record not only conclusions but also the arguments that support them.

When you record a claim, note its role in the original. Is it a main point? A minor point? A qualification or concession? By noting these distinctions you avoid this kind of mistake:

ORIGINAL BY JONES: “Researchers recognize that lung cancer has a number of causes, including genetic predisposition and exposure to environmental factors such as asbestos, radon, and fine particulates. But no one who has studied the data doubts that lung cancer’s leading cause is smoking.”

MISLEADING REPORT ABOUT JONES: Smoking is just one cause of lung cancer among many. Jones, for example, claims that “lung cancer has a number of causes, including genetic predisposition and exposure to environmental factors such as asbestos, radon, and fine particulates.”

Jones did not make that point at all. He *conceded* a point to set up the point he wanted to make. Anyone who deliberately misreports in this way violates basic standards of truth. But you can make such a mistake inadvertently if you note only a source’s words and not their role in an argument.

To avoid such mistakes, distinguish statements that are central to an argument from qualifications or concessions that the author acknowledges but downplays. Unless you are reading “against the grain” of the writer’s intention—to expose hidden tendencies, for example—do not report minor aspects of a source as though they were major or, worse, as if they were the source’s whole point.

3. Record the scope and confidence of a claim. These are not the same:

Chemicals in french fries cause cancer.

Chemicals in french fries may be a factor in causing cancer.

Some chemicals in french fries correlate with a higher incidence of some cancers.

Don’t mistake a summary of another writer’s views for those of an author summarizing them. Some writers do not clearly indicate when they summarize another’s argument, so it is easy to quote them as saying what they set out to disprove rather than what they in fact believe.

Note why sources agree and disagree. Two social scientists might claim that a social problem is caused by personal factors, not by environmental forces, but one might cite evidence from genetic inheritance while the other points to religious beliefs. How and why sources agree is as important as the fact that they do. In the same way, sources might disagree because they interpret the same evidence differently or take different approaches to the problem.

It is risky to attach yourself to what any one researcher says about an issue. It is not “research” when you uncritically summarize another’s work. Even if your source is universally trusted, be careful. If you rely on at least two sources, you’ll usually find that they do not agree entirely, and that’s where your own research can begin. *Which has the better argument? Which better respects the evidence?* In fact, you have a research problem right there—whom should we believe?

G. Do full fact checking of the mathematical results the author provided.

- Are The Facts Provided are Trustworthy?
- Are the FACTS are True or Wrong?
- Has the Author Did a Full Fact Checks on either side?
-

- H. Do full fact checking of the evidences the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- I. Any other information author provided do full fact checking.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

Bias vs Unbiased

- A. Listen and read if the author is biased or unbiased.
- B. Is the author best representative for one or another side?
- C. Is the author bias or not? What is the author's bias and purpose?
- D. Does the speaker or writer have personal or professional interest in the information they are presenting?
- E. How a writer might purposely present ideas or events in ways that favour a particular political party/organisation/religion/social group?
- F. Does the author presents facts and explain the ideas to reader or listener?
- G. Is the author uses facts and opinions to argue for or against some idea?
- H. Is the author tries to amuse or interest the reader with humour, suspense, intense and stories?
- I. Look at the language in the passage?
 - If it is neutral and objective, the purpose is probably simply to inform the reader?
 - If is includes terms and are strongly positive, negative or emotional, the purpose is probably to persuade the reader?
 - It is include situations or descriptions that are funny, surprising or intriguing the writer, probably wants to entertain the reader?
- J. Is the author biased?
 - Is the author presenting only one side of an argument?
 - Is it include only facts and examples that support writer's opinion?
 - Is it using the language intended to influence the reader's emotions?
 - Is it ridicules other opinions or views?
- K. Does the author have contradictory information, cherry picked evidence or carefully select language in which to present information favourably?
- L. Is the author or speaker speaks/writes for company, special interest group, an institute foundation think tank or political party?
- M. Does the author/writer gets paid or provided any gift for endorsement or opinion?
- N. Does the person have interest on this topic or has any personal gain? If not then this writer/speaker is disinterested, impartial/unbiased objective.
- O. If the speaker/writer has interest, then why does she/he present the information/ data in such a way?
- P. In surveys or studies has the author worded the question in such a way to ensure the sought-after response?

- Q. Is the company paid the author to prove that the device or product is better than any other product in the market?
- R. Is the marketer or industry trying to defend the product? Did the author put the best spin on its information?
- S. When was the survey or studies or experiment done?
- T. What day were the tests, survey or experiment done?
- U. Purpose of the author writing?
- V. How did the author handle opposing views? Is the author trying to persuade the reader to some belief?
- W. Does the author fairly handle the opposing view? Or did the author dismiss opposing points without regard to their possible value?
- X. Does the writer make any straw man fallacy, misrepresenting opposing views to more easily knock them down?
- Y. Did the author use slanted language or commit personal attack?
- Z. Does the writer use sweeping generalisation or demonstrate an either/or approach to complicated issues, thereby revealing a strong bias toward one side?
- AA. Does the writer pretend to be objective?
- BB. Does the writer intend to be ironic or satirical, if she or he is clearly exaggerating for effect?
- CC. Does the writer admit to guesswork and speculation?

6.7 Annotating Your Sources

6.7.1 Marginal Annotations

As an alternative to taking notes on paper or a computer, you can directly annotate many sources in print or digital form. Annotation is a technique of marking up a text through comments, questions, and cross-references to other texts. Annotating in the margins is generally more productive than simply highlighting because it brings into relief the relevance of a source to your project.

In annotating, you document the active reading practices discussed in this chapter. You can use annotations to identify a source's claims and keywords or "argue" with a source by questioning (or extending) its reasons, evidence, and warrants (see [part III](#)). As your project develops, you can return to an annotated text to see what you were thinking earlier.

Of course, not every text is equally available for annotation. You can't write in the margins of library books or other texts you do not own. Many texts are accessible only (or most conveniently) in digital form. Fortunately, however, there are digital annotation tools that let you document your reading in digital environments. You can use these tools to annotate a wide range of texts, including images, and to link your readings of various texts to create a searchable database for later retrieval.

The Value of Reading Widely

We have emphasized how important it is to have a good question to focus your research. Don't think, however, that you waste time reading sources that turn out to be irrelevant. In fact, when you read and record more than you use, you build up a base of knowledge crucial to the exercise of good thinking. Good thinking is a skill that you can learn, but you can exercise it only when you have a deep and wide base of knowledge to work on. So read sources not just to answer the question you ask today, but to help you think better about every question you'll ask for the rest of your research career. To that end, everything you read is relevant.

6.7.2 Annotated Bibliography

One approach to engaging sources is an annotated bibliography—a list of possible sources featuring both a citation and a brief descriptive summary of each source. (For more on citations, see 14.5.) There are multiple types of annotations based on the motive for creating them. For a research project, an annotated bibliography offers a bird's-eye view of a range of sources and the roles they might play in your paper. Often the

assembling of an annotated bibliography is a distinct stage in a research process, one that allows you (and your teacher) to reflect on the sources you have collected. Each annotation is an opportunity to evaluate the credibility of a source, summarize its argument, and explain its relevance to your project.

Compiling an annotated bibliography can serve as a checkpoint to gauge how thoroughly you have conducted your research and how deeply you have engaged the sources you have collected. If you can't summarize your sources or explain their relevance, you are likely not ready to write your paper.

Quick Tip: Manage Moments of Normal Anxiety

As you get deeper into your project, you may experience a moment when everything seems to run together into a hopeless muddle. That usually happens when you accumulate notes faster than you can sort them. Such moments can be stressful, but they can also be a sign that you are on the verge of a new insight or discovery.

You can minimize the panic by taking every opportunity to organize and summarize what you have gathered by *writing as you go* and by returning to the central questions: *What question am I asking? What problem am I posing?* Keep rehearsing that formula, *I am working on X to learn more about Y, so that my readers can better understand Z.* Writing regularly about these questions does more than help you stay focused; it also helps you think.

You can also turn to friends, classmates, teachers—anyone who will serve as a sympathetic but critical audience. Explain how what you have learned bears on your question and helps you resolve your problem. Ask them, *Does this make sense? Am I missing anything important? What else would you like to know?* You will profit from their reactions, but even more from the mere act of explaining your ideas to non-specialists.

Checking Each Fact's Sources, If they Are Reliable or Unreliable.

Sources the author used

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Listen or read what sources of information Author used
- C. What are the author's sources?
- Did the writer respond to those who have preceded them?
 - Has the writer depended on the primary/secondary/tertiary sources?
 - Has the writer misquoted the primary/secondary/tertiary or has he quoted the primary/secondary/tertiary source?
 - Has the writer uses statistics or data, has he used primary/secondary/tertiary source?
 - Has the writer interpreted the data or survey or statistics biased/unbiased?
 - Has the author correctly interpreted the information?
 - Has the author incorrectly interpreted information?
 - Search the very sources author uses and see if the author interpreted the information in correct way.
 - Has the author uses trust sources for the work he has written?

D. Is the Source Reliable or Unreliable?

E. Sources

- Is the author uses primary source in presenting some data or facts in his/her newspaper, article, book journal?
 4. Is the primary source reliable, fair, ethical and trustworthy?
 5. Is the primary source sloppy, biased, unethical?
 6. Is the primary source objective when they speaking about certain subject?
 7. Are the primary source present facts carefully or careless?
 8. Is the primary source truthfully presenting the facts, opinions and data?
 9. Who is the writer? Is he /she qualified expert to write about this topic?
 10. Did the write done proper research regarding the topic?
 11. What is the tone?
 12. What is the purpose of publication?
 13. What assumption does the author make?
 14. What are the bases of author's conclusions?
 15. Does the author agree or disagree with other authors on the subject?
 16. Was this written in regards of the counterargument other authors who have opposite views?
 17. Does the content agree or disagree with author/authors on the subject?
 18. Does the content agree or disagree with what you know or have learned about the issue?
 19. Where was the source made?
 20. Where is the material from? Is this a valid source of information?

F. Is the Source Reliable or Unreliable?

- What primary sources did the author use. This is the list of primary source:
 1. Data and original research.
 2. Diaries and journals.
 3. Letters and memos.
 4. Autobiographies and memoirs.
 5. Books or articles written at the time of event?
 6. Government documents.
 7. Census statistics.
 8. Organisational records.
 9. Documentaries.
 10. photographs, art (from the time period).
 11. Maps (from the period).
 12. Patents.
 13. Theses.
 14. Dissertations.
 15. Photographs.
 16. Journal articles.
 17. Newspaper articles.
 18. Survey research research.
 19. Meetings.
 20. Symposia.
 21. Original documents.
 22. Records of organisation.
 23. Internet.
 24. Email.
 25. Communication in listservs.
 26. Interviews.
 27. Video recordings.
 28. Audio recordings.
 29. Websites.
 30. Communication through social media.
 31. Artefacts.
 32. Reports.
 33. Works of art and architecture.
 34. Eyewitness.

- 35. Statistics.
- 36. Oral history.
- 37. Description of travel.
- 38. Cartoon.
- 39. Postcards.
- 40. Posters.
- 41. Internet communications.
- 42. Any above reprinted in the original format and language.

- Is the author use secondary source in presenting some data or facts in his/her newspaper, articles, book, magazine/, journal?
 1. Is the second hand source reliable, fair ethical and trustworthy?
 2. Is the second hand source being sloppy, biased, unethical in their quoting paraphrasing and summarising?
 3. Is the secondary source objectively when they are speaking about certain subject?
 4. Are the secondary source present facts carefully or careless?
 5. Is the secondary source truthfully presents the facts opinions/data?
 6. Is the secondary data was accepted blind faith or skeptically analysed by author?
 7. What secondary source did the author use? This is the list of secondary sources:
 - Encyclopedia
 - Chronologies
 - Biographies
 - Monographs
 - Most journal article
 - Literary criticism
 - Political analysis
 - Review of law and legislations
 - Essay on morals and ethics
 - Analyses of social policy
 - Study and teaching material
 - Literature reviews
 - Research articles
 - Criticism of works of literature, art and music
 - Most published books
 - Abstract of articles
 - Paraphrased quotation
 - Dictionaries
 - Textbooks
 - Commentaries
 - Magazines and newspaper articles
 - Website

8. Is the Source Reliable or Unreliable?

- Is the author use tertiary source in presenting some data or facts in her newspaper, articles, book journal or magazine
 1. Is the tertiary hand source reliable, fair, ethical and trustworthy?
 2. Is the tertiary hand source being sloppy, biased, unethical in their quoting, paraphrasing and summarising.
 3. Is the tertiary source objectively when they are speaking about certain subject?
 4. Are the tertiary source present facts carefully or careless?
 5. Is the tertiary source truthfully presents the facts opinions/data?
 6. Is the tertiary data was accepted blind faith or skeptically analysed by author?
 7. What tertiary source did the author use? List:
 - Almanacs
 - Bibliographies
 - Classification
 - Population registers
 - Chronologies
 - Dictionaries
 - Encyclopedias
 - Directories
 - Fact books
 - Guidebooks
 - Indexes
 - Abstract sources
 - Manuals textbooks
 - Handbooks
 - Wikipedia
 - Concordance
 - Field guides
 - Timelines
 - Surveys
 - Overview articles
 - Directories
 8. Is the Source Reliable or Unreliable?

PART III

Making an Argument

Prologue

Assembling a Research Argument

You can't wait to plan your argument until after you've gathered every last bit of data and found every last relevant source. In the first place, you'll never get them all. In the second, you'll end up researching mechanically or aimlessly, accumulating more and more stuff with no sense of what you'll do with it or following trails of bread crumbs who knows where. Of course, you have to do some research to get a handle on your project. But as soon as you have a sense of your problem and its likely solution, you should begin planning your argument. Your plan will change as your research progresses—if it doesn't, you probably aren't doing your best thinking—but making a plan early and modifying it as you go will help you grasp your material better and research more purposefully: only when you try to make a *research argument* that answers your readers' predictable questions can you see what research you have yet to do.

A research argument is not like the heated exchanges we hear every day. Those arguments usually involve a dispute: children argue over a toy, roommates over what music to play, drivers over who had the right-of-way. Such arguments can be polite or nasty, but most involve conflict, with winners and losers. To be sure, researchers sometimes wrangle over each other's reasoning and evidence and occasionally erupt into charges of carelessness, incompetence, and even fraud. But that kind of argument is not what made them researchers in the first place.

In the next five chapters, we examine a kind of argument that is less like a prickly dispute with winners and losers and more like a lively conversation with amiable and sometimes skeptical colleagues. It is a conversation in which you and your imagined readers *cooperatively* explore an issue that you both think is important to resolve, a conversation that aims not at coercing each other into agreement, but at cooperatively finding the best answer to an important but challenging question.

Getting to Know You

You've been told endlessly to think about your audience, but nothing is

harder than imagining questions from someone you don't know. Experienced researchers have the advantage of knowing many of their readers personally. They talk with them about research projects, trying out ideas before writing them up. If you are a beginning researcher or a student, you may not yet know your readers in this personal way. But you can do some homework to understand how they write, argue, and think:

Read journals that publish research like yours. Notice the kinds of questions the articles acknowledge and respond to.

Rehearse your argument with a more experienced researcher or a teacher. After you have a plan but before you draft, talk over your ideas, asking whether any seem doubtful or confusing.

Ask a few people you trust to read your drafts and indicate where they have questions or see alternatives. Find people as much like your intended readers as possible.

You can even try to get to know some actual readers. For example, a group of physicists once wanted biologists to notice their research but were unhappy when the first manuscript they sent to a biology journal was rejected. So they started attending biology conferences, reading biology journals, even hanging around the biology department's faculty lounge. After they figured out how biologists think, they rewrote their arguments and published papers that influenced the field. You may not be able to travel to conferences or hang out in a faculty lounge, but you can still get to know faculty and students on your campus working in your field. The better you know them, the better you will be able to imagine questions they might ask you.

In that conversation, though, you do more than politely trade opinions. We are all entitled to our opinions, and no law requires us to explain or defend them. But in a research argument, we are expected to show readers why our claims are important and then to support our claims with good reasons and evidence, as if our readers were asking us, quite reasonably, *Why should I believe that?*

In fact, although we more easily notice the heated disputes, we have these collaborative arguments every day, each time we trade good reasons for deciding what to do—when discussing with a friend what cell phone to buy, what books to read, even whether to get pizza or Chinese food. Like those friendly discussions, a research argument doesn't force a claim on readers. Instead, you start where your readers do, with their predictable questions about why they should accept your claim, questions they ask not to sabotage your argument but to test it, to help both of you find and understand a truth worth sharing. Of course, when you *write* an argument, no one is there to ask you those questions in person. So you must imagine them on your readers' behalf. It's those imagined questions and your answers that make your argument part of an ongoing conversation. In [chapter 7](#) we survey the elements that constitute a research argument. In [chapters 8–11](#) we explain each element in detail. In [part IV](#), we show you how to put that argument into writing.

7 Making Good Arguments

Use Logic.

Use Grammar.

Use Discourse Analysis of The Text

A. Use the Following Books for Discourse Analysis:

- Critical Discourse Analysis_ The Critical Study of Language.
- Discourse analysis.
- The Routledge handbook of discourse analysis.

An Overview

In this chapter, we explain what a research argument is and the five questions whose answers constitute one.

In [part II](#), we argued that real research involves more than just amassing information on a topic; we argued that it means developing solutions to problems you and your readers care about. Likewise, sharing the results of your research involves more than just giving your readers a “data dump” that says, *Here are some facts about my topic*; it means explaining your problem and justifying your solution in a *research argument*.

7.1 ARGUMENT AS A CONVERSATION WITH READERS

In a research argument, you make a *claim*, back it with *reasons* supported by *evidence*, *acknowledge* and *respond* to other views, and sometimes explain your *principles* of reasoning. There’s nothing arcane about these things: you do them in every conversation that inquires thoughtfully into an unsettled issue:

Abby: I hear last semester was a little rocky. How do you think this term will go?
[*Abby poses a problem that interests her, put in the form of a question.*]

Brett: Better, I hope. [*Brett makes a claim that answers the question.*]

Abby: Why is that? [*Abby asks for a reason to believe Brett’s claim.*]

Brett: I’ll finally be taking courses in my major. [*Brett offers a reason.*]

Abby: Why will that make a difference? [*Abby doesn’t see how Brett’s reason is relevant to his claim that he will do better.*]

Brett: When I take courses I'm interested in, I work harder. [*Brett offers a general principle that relates his reason to his claim.*]

Abby: What courses? [*Abby asks for evidence to back up Brett's reason.*]

Brett: History of architecture, introduction to design. [*Brett offers specific instances on which he based his reason.*]

Abby: But what about that calculus course you have to take again? [*Abby offers a point that contradicts Brett's reason.*]

Brett: I know I had to drop it last time, but I found a really good tutor. [*Brett acknowledges Abby's objection and responds to it.*]

Abby: But won't you be taking five courses? [*Abby raises another reservation.*]

Brett: I know. It won't be easy. [*Brett concedes a point he cannot refute.*]

Abby: Will you pull up your GPA? [*Abby asks about the limits of Brett's claim.*]

Brett: I should. I'm hoping for a 3.0, as long as I don't have to get a part-time job. [*Brett limits the scope of his claim and adds a condition.*]

If you can imagine yourself in that conversation, you'll find nothing strange about assembling a research argument. That's because the five elements of any argument are just answers to the kinds of questions Abby asks Brett—and that you must ask yourself on your reader's behalf:

Claim: What do you want me to believe? What's your point?

Reasons: Why do you say that? Why should I agree?

Evidence: How do you know? Can you back it up?

Acknowledgment and Response: But what about . . . ?

Warrant: How does that follow? What's your logic? Can you explain your reasoning?

In fact, you can think of your research as the process of figuring out answers to these questions.

7.2 SUPPORTING YOUR CLAIM

At the core of every research argument is the answer to your research question, the solution to your problem—your main claim. You have to back up that claim with two kinds of support: reasons and evidence.

7.2.1 Support Claims with Reasons

The first kind of support, a reason, is a statement that leads readers to accept your claim. We often join a reason to a claim with *because*: Elementary schools should make teaching foreign languages a priority *claim* because we acquire languages best and most easily when we are young. *reason*

Clarifying Some Terms

So far, we've used two terms to name the statement that sums up the results of your research. In the context of questions, we called it your *answer*. In the context of problems, we called it your *solution*. Now in the context of an argument, we'll call it your *claim*.

A *claim* is an assertion (which can be a single sentence or more) that demands support: *Climate change is threatening coastal cities*; *Toni Morrison's most important novel is Beloved*. Your *main claim* is the assertion your whole research argument supports. Some call this assertion your *thesis*.

A *reason* is an assertion that supports a claim: *[Because] climate change is causing ocean levels to rise*; *[Because] in Beloved, Morrison's major themes find their fullest development*.

Evidence is data deployed to support a reason. Unlike a claim or a reason, evidence is not always framed as an assertion: a data table documenting rising ocean levels over the past decade or quotations from *Beloved* illustrating Morrison's major themes would be forms of evidence.

These terms can be confusing, because a reason is also a subclaim that can be supported by more reasons and because both reasons and evidence are kinds of support. But if you stick with us, you'll see why these distinctions are important.

You often need more than one reason to support a claim, and in a complex argument, your reasons themselves will usually require further support:

Elementary schools should make teaching foreign languages a priority *claim 1* because we acquire languages best and most easily when we are young. *reason 1 supporting claim 1/claim 2* In fact, those who begin second languages as adults rarely attain the level of fluency of those who learn them as children. *reason 2 supporting reason 1 and claim 2/claim 3* Teaching foreign

languages at the elementary-school level also contributes to children's ethical development, *reason 3 supporting claim 1/claim 4* because it fosters an awareness of cultures and societies beyond their own. *reason 4 supporting reason 3 and claim 4/claim 5.*

7.2.2 Base Reasons on Evidence

The second kind of support is the evidence on which you base your reasons. We've said that reasons can be supported by still more reasons, but these chains don't go on forever. Eventually you have to show some data. That's your evidence. This distinction between reasons and evidence can seem just a matter of semantics, and in some contexts the words do seem interchangeable:

You have to base your claim on good reasons.

You have to base your claim on good evidence.

But they are not synonyms, and distinguishing them is crucial in making sound arguments. Compare these two sentences:

What evidence do you base your reason on?

What reason do you base your evidence on?

That second sentence seems odd: we don't base evidence on reasons; we base reasons on evidence.

There are other differences:

We use our minds to think up reasons.

We have to search for evidence "out there" in the world, then make it available for everyone to see.

It makes no sense to ask, *Where do I go to see your reasons?* It does make sense to ask, *Where do I go to see your evidence?*

In casual conversation, we usually support a claim with just a reason:

We should leave.*claim* It looks like rain.*reason*

Few ask, *What's your evidence that it looks like rain?* But when you address serious issues, readers expect you to base each reason on its own foundation of evidence, because careful readers don't accept reasons at face value. They ask for the evidence, the data, the facts on which you base those reasons:

Elementary schools should make teaching foreign languages a priority^{*claim 1*} because we acquire languages best and most easily when we are young.^{*reason 1 supporting claim 1/claim 2*} In fact, those who begin second languages as adults rarely attain the level of fluency of those who learn them as children.^{*reason 2 supporting reason 1/claim 3*} In a study of over one hundred second-language learners, Jones (2013) identified an inverse correlation between second-language proficiency and . . . (see table 1).^{*evidence supporting*}

reason 2

With reasons and evidence, we have the core of a research argument:

But in most cases, this core alone isn't enough: you also have to flesh out your research argument by *acknowledging and responding* to other points of view and, sometimes, by offering *warrants* that show how a reason is *relevant* to a claim.

7.3 ACKNOWLEDGING AND RESPONDING TO ANTICIPATED QUESTIONS AND OBJECTIONS

Careful readers will question every part of your argument, so you must anticipate as many of their questions as you can, and then acknowledge and respond to the most important ones. For example, when readers consider the claim that schools should make foreign-language instruction a priority, they may wonder if doing that might detract from the teaching of other subjects. If you think readers might ask that question, you would be wise to acknowledge and respond to it:

Elementary schools should make foreign languages a priority^{claim 1} because we acquire languages best and most easily when we are young.^{reason 1 supporting claim 1/claim 2 . . .} Of course, if schools increase the attention they give to foreign languages, quality of instruction in other subjects might decline.^{acknowledgment} But little evidence exists to support that fear and much dispels it. . . .^{response}

The challenge all researchers face, however, is not just responding to readers' questions, alternatives, and objections, but imagining them in the first place. (We'll address that issue in [chapter 10](#).)

Since no research argument is complete without acknowledgments and responses, we add them to our diagram to show how they relate to all the other parts of an argument:

7.4 CONNECTING CLAIMS AND REASONS WITH WARRANTS

Even when your readers agree that a reason is true, they may still object that it's not *relevant* to your claim. Consider this argument:

We are facing significantly higher health care costs in Europe and North America^{claim} because climate change is moving the line of extended hard freezes steadily northward.^{reason}

Readers might accept the *truth* of that reason but question its *relevance* to the claim, asking: *What do higher health costs have to do with hard freezes? I don't see the connection.* To answer, you must offer a *general* principle that justifies relating your *particular* reason to your *particular* claim:

When an area has fewer hard freezes, it must pay more to combat new diseases carried by subtropical insects no longer killed by those freezes.

Like all warrants, this one says that if a general circumstance exists (an area has fewer hard freezes), then we can infer a general consequence (that area will have higher costs to combat new diseases). The logic behind all warrants is that if a generalization is true or reasonable, then so must be specific instances of it.

But for that logic to work, readers must agree with four things. Two are easy to understand:

The warrant is true or reasonable: fewer hard freezes in fact mean higher medical costs.

The reason is true or reasonable: hard freezes in fact are moving north.

The next two are more difficult:

The specific circumstance in the reason qualifies as a *plausible instance* of the general circumstance in the warrant.

The specific consequence in the claim qualifies as a *plausible instance* of the general consequence in the warrant.

We can illustrate that logic like this: As we'll see, it's not easy to decide when you even need a warrant. Experienced researchers usually state them on only two occasions: when they think readers in their fields might ask how a reason is relevant to a claim or when they are explaining their fields' ways of reasoning to general readers. If you think your readers might not see the connection between a claim and reason, you must add a warrant to justify it:

When an area has fewer hard freezes, it can expect higher medical costs to cope with diseases carried by subtropical insects that do not survive freezes.
warrant Europe and North America must thus expect higher health care costs *main claim* because climate change is moving the line of extended hard freezes steadily north. *reason* In the last one hundred years, the line of hard freezes lasting more than two weeks has moved north at the rate of roughly . . . *evidence*

We can add warrants to our diagram to show that they connect a claim and its supporting reason:

(We know this matter of warrants is not easy to grasp; we explain it again in more detail in [chapter 11](#).)

7.5 BUILDING A COMPLEX ARGUMENT OUT OF SIMPLE ONES

Those five elements constitute a “basic” argument, but research arguments are more complex.

We almost always support a claim with two or more reasons, each of which must be supported by its own additional reasons and evidence and perhaps justified by its own warrant.

Since readers think of many alternatives and objections to any complex argument, careful researchers typically have to respond to a number of them.

Moreover, each reason, warrant, or response to an objection (all of which are statements or assertions) may itself have to be treated as a subclaim and supported by its own argument. Only the evidence “stands alone,” but even then you may have to explain where you got it, why you think it’s reliable, and how it supports your reason—and that may require yet another argument.

Cognitive Overload: Some Reassuring Words

It’s at about this point that many students new to research begin to feel overwhelmed. If so, your anxieties have less to do with your intelligence than with inexperience. One of us was explaining to teachers of legal writing how being a novice makes many first-year law students feel like incompetent writers. At the end of the talk, one woman reported that she had been a professor of anthropology whose published work was praised for the clarity of her writing. Then she switched careers and went to law school. She said that during her first six months, she wrote so incoherently that she feared she was suffering from a degenerative brain disease. Of course, she was not: she was going through the painful transition most of us experience when we try to write about matters we do not entirely understand for an audience we understand even less. She was relieved to find that the better she understood the law, the better she wrote about it.

If you feel overwhelmed, you can take comfort in that story, as did one reader who e-mailed us this:

In *Craft of Research* you write about a woman who switched from anthropology to law and suddenly found herself unable to write clearly.

After being an assistant professor of graphic design for five years, I recently switched to anthropology and suddenly found that writing anthropology papers is like pulling teeth. I thought to myself that I might have a degenerative brain disorder! I laughed out loud when I read about the anthropologist who switched to law. It made me feel a bit better.

And finally, most arguments also include background, definitions, explanations of issues that readers might not understand, and so on. If, for example, you were making an argument about the relationship between inflation and money supply to readers not familiar with economic theory, you would have to explain how economists understand those concepts. Serious arguments are complex constructions. ([Chapters 8–11](#) explain them in detail.)

7.6 CREATING AN ETHOS BY THICKENING YOUR ARGUMENT

Readers judge your arguments not just by the reasons and evidence you offer but also by how well you anticipate and address their questions and concerns. By “thickening” your argument in this way, you earn the confidence of your readers, building up what is traditionally called your *ethos*: the character you project in your argument. Do you seem to be the sort of person who considers issues from all sides, who supports claims with evidence that readers accept, and who thoughtfully considers other points of view? Or do you seem to be someone who sees only one point of view and dismisses or even ignores the views of others?

When you acknowledge other views and explain your principles of reasoning in warrants, you give readers good reason to work *with* you in developing and testing new ideas. In the long run, the *ethos* you project in individual arguments hardens into your reputation, something every researcher must care about, because your reputation is the tacit sixth element in every argument you write. It answers the unspoken question, *Can I trust you?* That answer must be *Yes*.

Quick Tip: A Common Mistake—Falling Back on What You Know

If you are an inexperienced researcher, you may be tempted to rely too heavily on what feels familiar. For example, you might embrace a claim too early, perhaps even before you have done much research, because you “know” you can prove it. But falling back on that kind of certainty will just keep you from doing your best thinking. Being a researcher means allowing yourself to be surprised by your discoveries and insights. So when you start a project, begin not with a claim you know you can prove but with a problem you want to explore and solve.

Likewise, when you are new to a field, you may be tempted to rely on ways of arguing that are familiar to you from your education or experience. If, for example, you learned in a literature class how to present and analyze

quotations, do not assume that you can do the same in fields that emphasize “objective data,” such as biology or experimental psychology. On the other hand, if as a biology or psychology major you learned to gather hard data and perform statistical analyses, do not assume that you can do the same in art history. This does not mean that what you learn in one class is useless in another. All fields share the elements of argument we describe here. But you have to learn what’s distinctive in the way a field handles those elements and be flexible enough to adapt, trusting the skills you’ve learned.

And when you become familiar with your field, you may be tempted to oversimplify in a different way. When some beginning researchers succeed at making one kind of argument, they just keep making it over and over. Their mastery of one kind of complexity blinds them to another: they fail to see that their field, if it is an active one, is marked by competing methodologies, competing solutions, competing goals and objectives. Don’t fall into this trap. If you’ve mastered one type of argument, try others: seek out alternative methods, formulate not only multiple solutions but multiple ways of supporting them, ask whether others would approach your problem differently.

When you are new to a topic or a field, you need ways to manage the complexity of new ideas and new ways of thinking. But guard against uncritically imposing familiar methods on new problems. As you learn more, you’ll recognize that things are neither as blindingly complex as you first feared nor as simple as you then hoped.

8 Making Claims

In this chapter, we discuss how to recognize the kind of claim that answers your research question and how to tell if your claim is specific and significant enough to serve as the main point of your argument.

You need a tentative answer to your research question to focus your search for evidence that will test and support its answer. As you test it, you will likely revise it, but as you assemble your argument, you must understand the kind of claim you are making. You must also be sure that your claim is not just sound, but significant enough to need an argument in the first place. Ask yourself three questions:

What kind of claim should I make?

Is it specific enough?

Will my readers think it is significant enough to need an argument supporting it?

When you can answer those three questions, you're ready to assemble your argument.

8.1 DETERMINING THE KIND OF CLAIM YOU SHOULD MAKE

The kind of problem you pose determines the kind of claim you make and the kind of argument you need to support it. As we saw in [chapter 4](#), academic researchers usually pose not *practical* problems but *conceptual* ones, the kind whose solution asks readers not to *act* but to *understand*:

The Great Recession of 2008–2011 was caused largely by negligent financial regulation that let banks take on too much risk.

8.1.1 Making Conceptual Claims

Beyond distinguishing between practical and conceptual claims, it is useful to recognize that claims address a range of questions: *Does a thing or a situation exist? If so, how should we characterize it? How did it get this way? Is it good or bad? What can or should be done about it?* Depending on the question or questions implicit in a claim, different

kinds of evidence will be required to support it. The claims you make on a topic will fall into one (or more) of the following classes:

- Claims of fact or existence:

Average global temperatures have risen to unprecedented levels within the past decade.

- Claims of definition and classification:

Birds, not reptiles, are the direct descendants of dinosaurs.

- Claims of cause and consequence:

Exposure to asbestos is a leading contributor to lung cancer.

- Claims of evaluation or appraisal:

Shakespeare's greatest comedy is *As You Like It*.

- Claims of action or policy:

Pennsylvania should increase extraction fees on natural gas drilling to fund education.

The first four classes—fact, definition, cause, and value—concern conceptual claims. For claims of fact or existence, you must provide evidence that a situation is, in fact, as you characterize it. Claims of definition or classification depend on reasoning about similarities or differences that assigns an entity to some broader class or distinguishes it from other entities. Effective claims of evaluation or appraisal depend on criteria of judgment to justify why something is good or bad (or better or worse than something else). Finally, claims of cause or consequence connect sets of facts to show that some situation does (or doesn't) follow from or lead to another.

8.1.2 Making Practical Claims

A practical claim is one that argues for (or against) some action or policy. It is usually built from a chain of conceptual claims: one that demonstrates that a problem exists, another that shows what causes the problem, and still another that explains how doing what you propose will fix it. Readers may also expect you to explain the following:

Why your solution is feasible; how it can be implemented with reasonable time and effort.

Why it will cost less to implement than the cost of the problem.

Why it will not create a bigger problem than the one it solves.

Why it is cheaper or faster than alternative solutions—a claim often difficult to support.

If you advance a practical claim but don't make those four sub-arguments, your readers may reject your whole argument. So as you assemble your argument, be clear about the kinds of claims you are making, whether conceptual or practical. Don't inflate the importance of a conceptual claim by tacking on a practical action, at least not early in your paper. If you want to suggest a practical application of your conceptual claim, do so in your conclusion. There, you can offer it as an action worth considering without having to develop a case for it (we return to this in [chapter 16](#)).

8.2 EVALUATING YOUR CLAIM

We can't tell you how to find a good claim, but we can show you how to evaluate the one you have from the point of view of your readers. Above all, they expect your claim to be both specific and significant.

8.2.1 Make Your Claim Specific

Vague claims lead to vague arguments. The more specific your claim, the more it helps you plan your argument and keep your readers on track as they read it. You make a claim more specific through precise language and explicit logic.

Precise Language. Compare these two claims:

TV inflates estimates of crime rates.

Graphic reports of violence on local TV news lead regular viewers to overestimate by as much as 150 percent both the rate of crime in their neighborhood and the personal danger to themselves and their families.

The first claim is so vague that we have little idea about what's to come. The second has more specific concepts that not only help readers understand the claim more clearly, but also give the writer a richer set of concepts to develop in what follows. Indeed, the precision of the claim signals how the argument is likely to proceed.

We do *not* recommend long, wordy claims for their own sake. But you benefit when you include in early versions of your claim more terms than you might ultimately use. That final claim should be only as specific as your readers need and should include only those concepts that you develop as themes in your argument.

Explicit Logic. You can also be explicit in the logic of your claim. Even with its relatively precise language, this claim offers only a single proposition:

Regular TV viewers overestimate both the rate of crime in their neighborhood and the personal danger to themselves and their families.

In the natural and social sciences, claims like that are common, even preferred. But in the humanities, such a claim might seem a bit thin. As you draft your working claim, try elaborating its logic in two ways:

Introduce it with a qualifying clause beginning with *although* or *even though*.

Conclude it with a reason-clause beginning with *because*.

For example:

Although violent crime is actually decreasing, regular TV viewers overestimate their neighborhood crime rate by 150 percent and therefore misjudge personal danger to themselves and their families **because local TV evening news regularly opens with graphic reports of mayhem and murder in familiar locations, making many believe that crime happens nightly outside their front door.**

While that claim may seem overwritten, it foreshadows three of the five elements that you need for a full argument: (1) *Although I acknowledge X*, (2) *I claim Y* (3) *because of reason Z*.

You can use an introductory *although* clause to acknowledge three kinds of alternative views:

- Something that your readers believe but your claim challenges:

Although most people believe they are good judges of their security, regular TV viewers overestimate . . .

- A point of view that conflicts with yours:

Although many security professionals see fear as the best motivation for safety precautions, regular TV viewers overestimate . . .

- A condition that limits the scope or confidence of your claim:

Although it is difficult to gauge their real feelings about personal security, regular TV viewers overestimate . . .

If readers might think of those qualifications, acknowledge them first. You not only imply that you understand their views, but commit yourself to

responding to them in the course of your argument.

When you add a final *because* clause, you forecast some of the reasons that support your claim:

Although many believe that school uniforms help lower the incidence of violence in public schools,^{qualification} the evidence is at best weak^{claim}

because researchers have not controlled for other measures that have been instituted at the same time as uniforms^{reason 1} and because the data reported are statistically suspect.^{reason 2}

Again, we don't suggest that your final draft should offer a claim as bloated as these. But the richer your *working* claim, the more satisfying your argument is likely to be.

8.2.2 Make Your Claim Significant

After the specificity of a claim, readers look most closely at its *significance*, a quality they measure by how much it asks them to change what they think. While we can't quantify significance, we can roughly estimate it: *if readers accept a claim, how many other beliefs must they change?* The most significant claims ask a research community to change its deepest beliefs (and it will resist such claims accordingly).

Some research communities consider a claim significant enough if it asks them only to accept new evidence on a topic of common interest:

I describe here six thirteenth-century Latin grammars of the Welsh language. Found just recently, these grammars are the only examples of their kind. They help us better appreciate the range of grammars written in the medieval period.

(Recall those reels of newly discovered film in 2.3.3.)

Readers value research more highly when it not only offers new data but *uses* those data to settle what seems puzzling, inconsistent, or otherwise problematic:

There has been a long debate about how fluctuations in consumer confidence affect the stock market, but new statistical tools suggest little relationship between . . .

But readers value most highly when new facts or conjectures *upset* what seems long settled:

It has long been an article of faith in modern physics that the speed of light is constant everywhere at all times, under all conditions, but new data suggest it might not be.

A claim like that would be contested by legions of physicists because if true, it would mean that physicists would have to change their minds not just about the speed of light but about lots of other things as well.

Early in your career, you won't be expected to know what those in a field think should (or even could) be revised. But you can still gauge the significance of your claim by asking how strongly readers might *contest* it. One way to do that is by considering *opposite* claims:

Hamlet is not a superficial character.

This report summarizes recent research on the disappearance of bees.

To assess how much either claim is worth contesting, change an affirmative claim into a negative one and vice versa:

Hamlet *is* a superficial character.

This report does *not* summarize recent research on the disappearance of bees.

If the reverse of a claim seems obviously false (like the first one) or trivial (like the second), then readers are likely to think the original claim is not worth an argument. (Of course, some great thinkers have successfully contradicted apparently self-evident claims, as Copernicus did when he asserted foolishly—or so it seemed at the time—that *the sun does not go around the earth.*)

If you are an advanced researcher, you measure the significance of your claim by how much it changes what your community thinks and how it does its research. Few discoveries have been as significant as Crick and Watson's structure of DNA. Not only did it make biologists think about genetics differently, but it opened up new lines of research.

But you don't have to make big claims to make a useful contribution: small findings can open up new lines of thinking. If, for example, you discovered that Abraham Lincoln read some obscure philosopher, historians would comb Lincoln's texts for traces of that influence.

If you are new to research, of course, your claim doesn't have to challenge the experts, just impress your teacher. If you can't predict whether it will, imagine your reader is someone like yourself. What did *you* think before you began your research? How much has your claim changed what *you* now think? What do *you* understand now that you didn't before? That's the best way to prepare for readers who will someday ask you the most devastating question any researcher can face: not *Why should I believe this?* but *Why should I care?*

8.3 QUALIFYING CLAIMS TO ENHANCE YOUR CREDIBILITY

Some new researchers think their claims are most credible when they are stated most forcefully. But nothing damages your ethos more than arrogant certainty. As paradoxical as it seems, you make your argument stronger and more credible by modestly acknowledging its limits. You gain the trust of your readers when you acknowledge and respond to their views, showing that you have not only understood but considered their position (for more, see [chapter 10](#)). But you can lose that trust if you then make claims that overreach. Limit your claims to what your argument can actually support by qualifying their scope and certainty.

8.3.1 Acknowledge Limiting Conditions Every claim has limiting conditions:

We conclude that the epicenter of the earthquake was fifty miles southwest of Tokyo, **assuming the instrumentation was accurately calibrated.**

We believe that aviation manufacturing will not match its late twentieth-century levels, **unless new global conflicts increase military spending.**

But every claim is subject to countless conditions, so mention only those that readers might plausibly think of. Scientists rarely acknowledge that their claims depend on the accuracy of their instruments, because everyone expects them to ensure that they are. But economists often acknowledge limits on their claims, both because their predictions are subject to changing conditions and because readers want to know which conditions to watch for.

Consider mentioning important limiting conditions even if you feel readers would not think of them. For example, in this next example, the writer not only shows that she was careful but gives a fuller and more accurate statement of the claim:

Today Franklin D. Roosevelt is revered as one of our most admired historical figures, but toward the end of his second term, he was quite unpopular, **at least among certain segments of American society**.^{claim} Newspapers, for example, attacked him for promoting socialism, a sign that

a modern administration is in trouble. In 1938, 70 percent of Midwest newspapers accused him of wanting the government to manage the banking system. . . . Some

have argued otherwise, including Nicholson (1983, 1992) and Wiggins (1973), both of whom offer anecdotal reports that Roosevelt was always in high regard,^{acknowledgment} but these reports are supported only by the memories of those who had an interest in deifying FDR.^{response}

Unless it can be shown that the newspapers critical of Roosevelt were controlled by special interests,^{limitation on claim} their attacks demonstrate significant popular dissatisfaction with Roosevelt's presidency.^{restatement of claim}

8.3.2 Use Hedges to Limit Certainty

Only rarely can we state in good conscience that we are 100 percent certain that our claims are unqualifiedly true. Careful writers qualify their certainty with words and phrases called *hedges*. For example, if anyone was entitled to be assertive, it was Crick and Watson, the discoverers of the helical structure of DNA. But when they announced their discovery, they hedged the certainty of their claims (hedges are boldfaced; the introduction is condensed):

We **wish to suggest a** [note: not *state the*] structure for the salt of deoxyribose nucleic acid (D.N.A.). . . . A structure for nucleic acid has already been proposed by Pauling and Corey. . . . **In our opinion**, this structure is unsatisfactory for two reasons: (1) **We believe** that the material which gives the X-ray diagrams is the salt, not the free acid. . . . (2) **Some** of the van der Waals distances **appear** to be too small. (J. D. Watson and F. H. C. Crick, "Molecular Structure of Nucleic Acids")

Without the hedges, Crick and Watson would be more concise but more aggressive. Compare that cautious passage with this more forceful version (much of the aggressive tone comes from the *lack* of qualification):

We **announce** here **the** structure for the salt of deoxyribose nucleic acid (D.N.A.). . . . A structure for nucleic acid has already been proposed by Pauling and Corey. . . . Their structure **is** unsatisfactory for two reasons: (1) The material which gives their X-ray diagrams is the salt, not the free acid. . . . (2) Their van der Waals distances **are** too small.

Of course, if you hedge too much, you will seem timid or uncertain. But in most fields, readers distrust flatfooted certainty expressed in words like *all*,

no one, every, always, never, and so on. Some teachers say they object to all hedging, but what most of them really reject are hedges that qualify every trivial claim. And some fields do tend to use fewer hedges than others. It takes a deft touch. Hedge too much and you seem mealy-mouthed; hedge too little and you can seem overconfident. Unfortunately, the line between the two is thin. So watch how those in your field manage uncertainty and do likewise.

9 Assembling Reasons and Evidence

In this chapter, we discuss two kinds of support for a claim: reasons and evidence. We show you how to distinguish between the two, how to use reasons to organize your argument, and how to evaluate the quality of your evidence.

Readers look first for the core of an argument, a claim and its support. They look particularly at its set of reasons to judge its plausibility and their order to judge its logic. If they think those reasons make sense, they will look at the evidence you present, the bedrock of every argument. If they don't believe the evidence, they'll reject the reasons and, with them, your claim.

So as you assemble your argument, you must offer readers a plausible set of reasons, in a clear, logical order, based on evidence they will accept. This chapter shows you how to do that.

9.1 USING REASONS TO PLAN YOUR ARGUMENT

When you order your reasons, you build a logical structure for your argument. To test that structure, you can make a traditional outline or visualize your plan in other ways. You might find it useful to create a chart-like outline known as a "storyboard." To start a storyboard, write your main claim and each reason (and subreasons) at the top of separate index cards or pages. Then below each reason (or subreason), list the evidence that supports it. If you don't have the evidence yet, note the *kind* of evidence you'll need. Finally, arrange the pages or index cards on a table or wall to make their logical relationships visible at a glance.

Read just the reasons, not the details, to see if that order makes sense. If it doesn't, try out different orders until it does. At this point, you are outlining only your argument, not

your paper. When you turn to a first draft, you will reconsider your reasons in light of your readers' understanding (and yours) and perhaps arrange a new order (for more on ordering parts, see 12.1.3).

9.2 DISTINGUISHING EVIDENCE FROM REASONS

Once you've arranged your reasons in a plausible order, be sure you have sufficient evidence to support each one. Readers will not accept a reason until they see it anchored in what *they* consider to be a bedrock of established fact. The problem is, you don't get to decide that; your readers *do*. To count as evidence, a statement must report something that readers agree not to question, at least for the purposes of the argument. But if they do question it, what you think is hard factual evidence is for them only a reason, and you have not yet reached that bedrock of evidence on which your argument must rest.

Consider this argument:

American higher education must curb escalating tuition costs,*claim* because the price of college is becoming an impediment to realizing the American dream.*reason* **Today a majority of students leave college with a crushing debt burden.***evidence*

In that last sentence, the writer offers what she believes is a "fact" hard enough to serve as evidence to support her reason.

But a skeptical reader might ask, *That's just a generalization. What hard numbers do you have to back up "a majority of students" or "crushing debt burden"?* Such a reader treats that statement not as an unquestioned fact but as a soft reason still in need of hard evidence. The writer would have to add something like this:

In 2013, nearly 70 percent of students borrowed money for college with loans averaging \$30,000, a debt that prevents many from buying a home, beginning a family, or pursuing a higher degree.*evidence*

Of course a *really* skeptical reader could again ask, *What backs up those numbers? What justifies the claim that this situation is a crisis?* If so, the writer would have to provide still harder data, breaking down those numbers to document the consequences of debt for recent graduates. If she did her own research, she could show her raw data. If she found her data in a secondary source, she could cite it, but she might then be asked to prove that her source is reliable. Really skeptical readers just never give up.

If you can imagine readers plausibly asking, not once but many times, *How do you know that? What facts make it true?*, you have not yet reached what readers want—a bedrock of uncontested evidence. And at a time when so-called experts are quick to tell us what to do and think based on studies whose data we never see, careful readers have learned to view reports of evidence skeptically. Even when you think you have good evidence, be clear how it was collected and by whom. If it was collected by others, find and cite a source as close to the evidence as you can get.

Our Foundational Metaphors for Evidence

When we talk about evidence, we typically use foundational metaphors: good evidence is *solid, hard, the bedrock foundation* on which we *build* arguments, something we can *see for ourselves*. Bad evidence is *flimsy, weak, or thin*. Language like that encourages readers to think of evidence as a reality independent of anyone's interpretation and judgment. But data are always constructed and shaped by those who collect and use them as evidence. As you build your argument, keep in mind that your evidence will *count* as evidence only if your readers accept it without question, at least for the moment.

9.3 DISTINGUISHING EVIDENCE FROM REPORTS OF IT

Now a complication: researchers rarely include in any report *the evidence itself*. Even if you collect your own data, counting rabbits in a field or interviewing the unemployed, your paper can only *refer to* or *represent* those rabbits and unemployed in words, numbers, tables, graphs, pictures, and so on. For example, when a prosecutor says in court, *Jones was a drug dealer, and here is the evidence to prove it*, he can hold up a bag of cocaine, even let jurors hold it in their own hands. (Of course, both he and the jurors must believe the officer who says it's the same bag he took from Jones and the chemist who says that the white stuff really is cocaine.) But when he *writes* a brief on the case, he cannot staple that bag to the page; he can only refer to or describe it.

In the same way, researchers cannot share with their readers “the evidence itself.” For example:

Emotions play a larger role in rationality than many think.*claim* In fact, without the emotional centers of the brain, we could not make rational decisions.*reason 1 supporting claim* Persons whose brains have suffered physical damage to their emotional

centers cannot make the simplest decisions.*reason 2 supporting reason 1* For example, consider the case of Mr. Y, who . . . *report of evidence*

That argument doesn't offer as evidence real people with damaged brains; it can only report observations of their behavior, copies of their brain scans, tables of their reaction times, and so on. (In fact, we prefer to read reports of others than to have to test brains and read MRI scans ourselves.)

We know this distinction between evidence and reports of evidence must seem like a fine one, but it emphasizes two important issues. First, data you take from a source have invariably been shaped by that source, not to misrepresent them, but to put them in a form that serves that source's ends. For example, suppose you want to show that the cult of celebrity distorts rational compensation, and you need evidence that athletes and entertainers are paid far more than top doctors, generals, and government officials. You could find government salaries in official reports. But unless you can peek at the tax returns of Oprah and Tiger Woods (and who knows how reliable they would be), you would have to depend on reports of those incomes that may or may not have been systematically collected and compiled from still more distant reports. Unless you can talk to those who counted, organized, and reported the original data, you'll be at three or four removes from the evidence itself before you use it for your own purposes. (And at least one reporter in that chain of reports almost certainly miscopied some of the data.)

Second, when you in turn report those data as your own evidence, you cannot avoid manipulating them once again, at least by putting them in a new context. Even if you collected the data yourself, you tidied them up, making them seem more coherent than what you actually saw, counted, and recorded in your notes. In fact, even before you started collecting any facts at all, you had to decide what to count, how to categorize the numbers, how to order them, whether to present them in the form of a table, bar chart, or graph. Even photographs and video recordings reflect a particular point of view. In short, facts are shaped by those who collect them and again by the intentions of those who use them.

This often squishy quality of reports of reports (of reports of reports) is why people who read lots of research are so demanding about the reliability of evidence. If you collect data

yourself, they'll want to know how you did it. If you depend on sources, they'll expect you to use primary sources, and if you didn't, to get as close to primary sources as you can. And they want complete citations and a bibliography so that they could, if they wanted to, look at your sources themselves. In short, they want to know that they can trust the complete chain of reports between what's "out there" and what they are reading.

Trusting Evidence Three Hundred Years Ago and Now

In the early days of experimental science, researchers conducted experiments before what they called "witnesses," reputable scientists who observed the experiments so that they could attest to the accuracy of the reported evidence. Researchers don't rely on witnesses anymore. Instead, each area of study has standardized its methodologies for collecting and reporting evidence to ensure that it is reliable (though some researchers still get away with fraud). When you observe the standard procedures in your field, you encourage readers to accept your evidence at your word,

without their needing to see it themselves. So as you read secondary sources, note the kind of evidence they cite, how they cite it, then do likewise. When in sociology, do as sociologists do.

We live in an age where we are all subjected to research reports and opinion surveys that are at best dubious and at worst faked, so you have to assure your readers that they can trust your data. The last link in that chain of credibility is you, so be thoughtful about whose data you use and how you use them.

9.4 EVALUATING YOUR EVIDENCE

Once you know the kind of evidence your readers expect, you must test the reliability of yours: is it *sufficient* and *representative*, reported *accurately* and *precisely*, and taken from an *authoritative* source? These are not exotic criteria unique to academic research. We all apply them in our most ordinary conversations, even with children. In the following, “Parent” faults “Child” on all those criteria:

Child: I need new sneakers.*claim* Look. These are too small.*evidence*

Parent: Your feet haven’t grown that much in a month, and they don’t seem to hurt you much [*i.e., your evidence could be relevant, but I reject it because it is not accurate and because even if it were accurate, “too small” is not sufficiently precise*].

Child: But they’re too grungy for school.*reason* Look at this dirt and these raggedy laces.*evidence*

Parent: The dirt will wash off and the laces can be replaced. That’s not enough to buy new sneakers [*i.e., you may be factually correct, but dirt and raggedy laces alone are not sufficient evidence that they are unfit for school*].

Child: They hurt.*reason* Look at how I limp.*evidence*

Parent: You were walking fine a minute ago [*i.e., your evidence is not representative*].

Child: Everybody thinks I should get new sneakers.*reason* Harry said
so.*evidence*

Parent: Harry’s opinion doesn’t matter in this house [*i.e., Harry may have said that, but his opinions are not authoritative*].

Readers judge reports of evidence by the same criteria a parent uses with a child. They want evidence to be accurate, precise, sufficient, representative, and authoritative. (Readers also expect evidence to be *relevant*, but we’ll discuss that in [chapter 11](#).) As you assemble your evidence, screen it for those criteria before you add it to your storyboard.

9.4.1 Report Evidence Accurately

Careful readers are predisposed to be skeptical, so they will seize on the most trivial mistake in your evidence as a sign of your unreliability in everything else. Whether your research argument depends on data collected in a lab, in the field, in the library, or

online, record those data completely and clearly, then double-check them before, as, and after you write them up. Getting the easy things right shows respect for your readers and is the best training for dealing with the hard things. You can sometimes use even questionable evidence, *if you acknowledge its dubious quality*. In fact, if you point to evidence that seems to support your claim but then reject it as unreliable, you show yourself to be cautious, self-critical, and thus trustworthy.

9.4.2 Be Appropriately Precise

Your readers want you to state your evidence precisely. They hear warning bells in words that hedge your claim in such a way that they cannot assess its substance:

The Forest Service has spent **a great deal** of money to prevent forest fires, but there is still **a high probability** of **large, costly** ones.

How much money is *a great deal*? How probable is *a high probability*—30 percent? 80 percent? What counts as *large* and *costly*? Watch for words like *some*, *most*, *many*, *almost*, *often*, *usually*, *frequently*, *generally*, and so on. Such words can appropriately limit the breadth of a claim (see 8.3), but they can also fudge it if the researcher didn't work hard enough to get the precise numbers.

What counts as precise, however, differs by field. A physicist measures the life of quarks in fractions of a nanosecond, so the tolerable margin of error is vanishingly small. A historian gauging when the Soviet Union was at the point of collapse would estimate it in months. A paleontologist might date a new species give or take tens of thousands of years. According to the standards of their fields, all three are appropriately precise. (Evidence can also be too precise. Only a foolhardy historian would assert that the Soviet Union reached its point of inevitable collapse at 2:13 p.m. on August 18, 1987.)

9.4.3 Provide Sufficient, Representative Evidence

Beginners typically offer too little evidence. They think they prove a claim with one quotation, one number, one personal experience (though sometimes only one bit of evidence is sufficient to *disprove* it). For example:

Shakespeare must have hated women because those in *Hamlet* and *Macbeth* are evil or weak.

Readers need more than that to accept such a significant claim. Even if you offer lots of evidence, your readers still expect it to be

representative of the full range of variation in what's available. The women in one or two Shakespearean plays do not represent all his women, any more than Shakespeare represents all Elizabethan drama. Readers are especially wary when your evidence is a small sample from a large body of data, as in surveys. Whenever you use sampled data, not only must your data *be* representative, but you must *show* that it is.

A charge related to the claim that your evidence is unrepresentative is that it is *anecdotal*. It *might* be representative but, then again, it might not. If your claim depends on one or two examples, however well-chosen to be representative, there is a risk that your evidence will be dismissed as a form of cherry-picking. Of course, anecdotal evidence can be persuasive in ways that statistical representations of data are not. The very persuasiveness of the telling example, the case study, or the exception that proves the rule makes argument by anecdote attractive but also risky because an argument is only as strong as its evidence.

9.4.4 Consider the Weight of Authority

Different fields define and evaluate evidence differently. If you're a beginner, you'll need time to learn the kinds of evidence that readers in your field accept and reject. The most painful way to gain that experience is to be the object of their criticism. Less painful is to seek examples of arguments that failed because their evidence was judged unreliable. Listen to lectures and class discussions for the kinds of arguments that your instructors criticize because they think that the evidence is weak. Failed arguments help you understand what counts as reliable better than do successful ones.

A particular kind of weak evidence comes from sources that readers do not consider authoritative. Early in the twentieth century, New Yorkers accepted the word of a local newspaper: "If you see it in the *Sun*, it's so." In general, readers assign degrees of authority to sources based on their reputation for rigor and objectivity. For example, most people will accept data on the transmission of viruses that a researcher obtains from the U.S. Centers for Disease Control as credible evidence, even allowing for the possibility of error. However, evidence from *Wikipedia* will not be accepted in many circles because

Wikipedia is not regarded as authoritative. “Consider the source” is the skeptic’s rebuttal to evidence dismissed for lack of authority.

10 Acknowledgments and Responses

An argument is not complete if it fails to recognize other points of view. This chapter shows how you can make your argument more convincing by acknowledging and responding to questions, objections, and alternatives your readers might raise.

The core of your argument is a claim backed by reasons based on evidence. You thicken it with more reasons, perhaps supporting each with additional subreasons and evidence. But if you give your readers only claims, reasons, and evidence—no matter how compelling these are to you—they may still find your argument thin or, worse, ignorant or dismissive of their views. To craft a successful argument, you must do more than assemble a sound edifice of claims, reasons, and evidence; you must also position those claims as contributions to an ongoing conversation in which your readers are invested (see [chapter 7](#)).

You can do this in your introduction by presenting your main claim as a solution to a problem your readers care about (we'll talk more about introductions in [chapter 16](#)). But you can do it throughout your argument as well by anticipating, acknowledging, and responding to questions, objections, and alternatives that your readers are likely to raise along the way. As you plan and draft your paper, your readers won't be there to question you or to offer their own views. So you have to *imagine* their questions and views and take them into account. That's how you establish a cooperative relationship with readers, by imagining yourself conversing with them.

In this chapter, we show you how to imagine and address two kinds of questions that readers may ask about your argument:

They may question its *intrinsic* soundness by challenging the clarity of your claim, the relevance of your reasons, or the quality of your evidence.

They may question its *extrinsic* soundness by asking you to consider alternatives—different ways of framing the problem, evidence you've overlooked, or what others have written on your topic.

When you anticipate, acknowledge, and respond to both kinds of questions, you create an argument that readers are more likely to trust and accept.

10.1 QUESTIONING YOUR ARGUMENT AS YOUR READERS WILL

When planning and drafting your argument, you may freeze up if you try from the outset to imagine every possible reaction to it. Therefore, focus first on what you yourself want to say, on the claims, reasons, and evidence that make up your argument's core. Once you have that core, try to imagine readers' responses to it. Doing this may be hard, because you know your own argument too well and may believe in it too much to seriously challenge it. If you can share the core of your argument with a friend, mentor, or colleague you trust, do it. That will help you identify questions, objections, and alternatives that other readers might raise. If you can't, then imagine a group of particularly skeptical hypothetical readers questioning your argument more sharply than you hope your actual readers will.

For this exercise, you might suspend your conception of argument as collaborative inquiry and imagine it not quite as warfare, but as something close to a warm debate. View your argument through the eyes of someone who has a stake in a different outcome, someone who *wants* you to be wrong.

First, examine your problem. Here are some questions with possible answers from an imagined reader:

Why do you think there's a problem at all? "The costs or consequences of the situation you are responding to don't seem that significant."

Have you properly defined the problem? Is it practical or conceptual? "Maybe the problem involves not the issue you raise but another one."

Then consider your solution:

Is your solution practical or conceptual? That is, does it ask readers to do something or to understand something? And does it match the problem (practical problems demand practical solutions; conceptual problems conceptual ones)? "You explain what's wrong, but you don't say how we can change it." "You assert that our current understanding falls short, but you don't offer a new way of looking at the issue."

Have you stated your claim too strongly? "I can think of exceptions and limitations."

5a. *Why is your practical solution better than others?* “I think that what you propose will cost too much and create new problems.”

5b. *Why is your conceptual solution better than others?* “It doesn’t seem to fit with all this other well-established knowledge.”

If you come up with a question that you can’t answer, decide whether you can find the answer before you go on. Don’t go easy on yourself with this one: the time to fix a problem with your argument is when you find it.

Note where your argument might seem weak but actually isn’t. If, for example, you anticipate that readers will think your solution has costs that it does not, you can defuse that concern by acknowledging and responding to it:

It might seem that by focusing on the actions of specific banks, we are minimizing the systemic forces that contributed to the financial crisis, but, in fact, our case studies will show . . .

Next, question your support. Imagine a reader challenging your evidence.

A reader might question its nature:

“I want to see a different *sort* of evidence—hard numbers, not anecdotes (or stories about real people, not cold numbers).”

If you present the right kind of evidence, a reader might still question its quality:

“It isn’t accurate. The numbers don’t add up.”

“It isn’t precise enough. What do you mean by ‘many’?”

“It isn’t current. There’s newer research than this.”

“It isn’t representative. You didn’t get data on all the groups.”

“It isn’t authoritative. Smith is no expert on this matter.”

The toughest objection, however, is usually this one:

“You need more evidence. One data point (quotation/number/anecdote) is not sufficient.”

Most researchers have difficulty finding enough good evidence to make a solid case, especially those working on short deadlines. But teachers grumble most about students who seem to think that the evidence they find first is all they need.

Readers can be particularly skeptical when they have a stake in a solution that differs from yours. So if you feel your evidence is less than unassailable, you may want to admit its limitations candidly, before readers reject your argument because you overstated it.

Finally, readers may not see how your reasons support your claims, or how your claim follows from your reasons. We devote all of [chapter 11](#) to this problem.

In sum, when assembling your argument, test your claims, reasons, and evidence as your most skeptical readers will—and even in ways they might not. You can then address at least the most important objections that you can imagine them raising. Show readers that you put your argument through your own wringer before they put it through theirs.

10.2 IMAGINING ALTERNATIVES TO YOUR ARGUMENT

When you recognize your own argument's limitations, you build credibility by showing readers that you are making an honest case and dealing with them fairly. But that's just a defensive move. You will seem even more credible if you show not just that you understand the strengths and limitations of your own argument, but that you also understand and have thought about the alternatives to it. To do that, you have to bring those alternative views into your argument by acknowledging and responding to them.

If you know your subject and readers very well, you can try to imagine those alternatives yourself. But usually the best way to identify alternative views is to look to your sources. In [chapter 6](#), we encouraged you to actively *engage* your sources during your research, to use them not just for data but to stimulate your own thinking. Your sources also offer a ready supply of alternative views that you can respond to in your own argument.

You can think of your secondary sources as a written record of the conversation about your topic, question, or problem. Knowing that conversation allows you to contribute to it. When you read your sources, note where they advance claims different from yours, take different approaches, focus on different aspects of the problem, and so on. Note especially where—and why—you and your sources disagree. Also note where one source disagrees with another. All those disagreements can help you identify alternatives to acknowledge in

your own argument. If you know how you would respond to a particular source, add that response to your notes as you read.

You can respond not only to your sources' claims but also to their evidence. If you find a source's evidence unreliable or irrelevant, don't simply ignore it. If your readers might take it seriously, you can acknowledge it but explain why you didn't use it.

Finally, your sources also help you imagine your readers and anticipate their reactions to your argument. Often your readers will be like your sources' authors; sometimes they may even include them.

10.3 DECIDING WHAT TO ACKNOWLEDGE

If you can imagine just a few of the questions, alternatives, and objections that your readers might have, you'll face a Goldilocks moment: acknowledge too many and you distract readers from the core of your argument; acknowledge too few and you seem indifferent to or even ignorant of their views. You need to figure out how many acknowledgments will feel "just right."

10.3.1 Choosing What to Respond To

To narrow your list of alternatives or objections, consider these priorities:

- plausible charges of weaknesses that you can rebut

- alternative lines of argument important in your field

- alternative conclusions that readers *want* to be true

- alternative evidence that readers know

- important counterexamples that you have to address

Look for alternatives that let you repeat a part of your argument. For example, if readers might think of exceptions to a definition that in fact are not, acknowledge them and use the response to reinforce your point:

Some have argued that even food can be addictive, but remember we are concerned here only with substances for which addiction is the norm, not those . . .

Or if readers might think of an alternative solution close to yours, use it to reiterate the virtues of your solution:

Most researchers argue that rules and other forms of formal writing advice degrade rather than improve performance because writing “is a non-conscious act of making meaning, not a conscious process of following rules.” That is true for parts of the process: writers should not consult rules as they draft sentences. But writing involves not just drafting but many conscious processes as well. What we show here is what kinds of formal advice do and do not work for *conscious* aspects of writing. . . .

Finally, acknowledge alternatives that may particularly appeal to your readers, but only if you can respond without seeming to be dismissive. Better to ignore what your readers like than to disparage it.

10.3.2 Acknowledging Flaws in Your Argument

If you discover a flaw in your argument that you cannot fix or explain away, try to redefine your problem or rebuild your argument to avoid it. But if you cannot, you face a tough decision. You could just ignore the flaw and hope your readers don’t notice it. But that’s dishonest. If they do notice it, they will doubt your competence, and if they think you tried to hide it, they will question your honesty. Our advice may seem naive, but it works: candidly acknowledge the issue and respond that

the rest of your argument more than balances the flaw.

while the flaw is serious, more research will show a way around it.

while the flaw makes it impossible to accept your claim fully, your argument offers important insight into the question and suggests what a better answer would need.

Occasionally researchers turn failure into success by treating a claim they wanted to support but couldn’t as a hypothesis that others might find reasonable. Then they show why it isn’t:

It might seem that when jurors hear the facts of a case in a form that focuses on the victim and emphasizes her suffering, they will be more likely to blame the accused. That is, after all, the standard practice of plaintiffs’ lawyers. But in fact, we found no correlation between . . .

10.3.3 Acknowledging Questions You Can't Answer

Beginning researchers sometimes think that their goal is to have the last word on a topic, that is, to make an argument that allows for no response but total assent. But that's a mistake. Experienced researchers and teachers understand that no argument is entirely unassailable and that any one version of the truth is often complicated and always contestable. In fact, the most stimulating research is often that which provides not answers to questions we already know, but new sets of questions we haven't yet thought to ask. This is especially true for research addressing conceptual problems, but it can be true for applied research as well.

Knowledgeable readers will think better of your argument and of you if, rather than pretending you have all the answers, you acknowledge your argument's limits, especially those that squeeze you more than you like. Concessions invite readers into the conversation by legitimizing their views, always a gesture that helps sustain a community of researchers. And they will be especially grateful if you can give them new and interesting questions to think about. That's what keeps the conversation going.

10.4 FRAMING YOUR RESPONSES AS SUBORDINATE ARGUMENTS

Acknowledging alternatives and objections gives you an opportunity to respond. But you can't just offer a competing claim. Even a minimal response gives a reason to limit or reject what you have acknowledged:

Some have argued that food can be addictive,,acknowledgment of objection but we are concerned here only with substances for which addiction is the norm.reason why objection is irrelevant

That initial response may be enough, but only if readers recognize the basis for it, either because it's obvious or because you've made the argument before. Otherwise, explain its basis using additional reasons and evidence:

Some have argued that food can be addictive,,acknowledgment of objection but we are concerned here only with substances for which addiction is the norm.reason why objection is irrelevant Some who taste chocolate once may be unable to resist it thereafter, but their number is a fraction of those who are immediately addicted to crack cocaine

after a single exposure^{.subreason} Chernowitz (1998) found that just one exposure resulted in . . .^{report of} *evidence*

For more substantial responses, you need a full argument, with multiple reasons, evidence, and perhaps even warrants and additional acknowledgments and responses. (At this point, add acknowledgments and responses to the appropriate places in the working plan of your argument. In [chapter 12](#) we'll discuss where to put them in the plan of your first draft.) Again, when responding to alternatives, you face a Goldilocks choice: not too much, not too little. Only experience can teach you how to find this balance. So notice how experts achieve it and do likewise.

10.5 THE VOCABULARY OF ACKNOWLEDGMENT AND RESPONSE

Some writers fail to acknowledge alternatives because they can't think of any. The strategies in this chapter will help you overcome that problem. Others can think of views to acknowledge, but fear that if they do, they weaken their argument. In fact, most readers think that such acknowledgments enhance a writer's credibility. Writers also shy away from acknowledging and responding to objections and alternatives because they don't know how to do those things in writing, on the page or screen. This section shows you how.

When you want to acknowledge and respond to an objection or alternative, you have to decide how much credence to give it: options range from just mentioning an objection and dismissing it to addressing it at length. We present our advice roughly in that order, from most dismissive to most respectful. (Brackets and slashes indicate alternative choices.)

10.5.1 Acknowledging Objections and Alternatives

Acknowledge an objection or alternative in language that shows how much weight you give it. Here are some options.

You can downplay an objection or alternative by introducing it with *despite*, *regardless of*, or *notwithstanding*:

[Despite/Regardless of/Notwithstanding] Congress's claims that it wants to cut taxes^{,acknowledgment} the latest budget proposals suggest that .
^{. .response}

Use *although*, *while*, and *even though* in the same way:

[Although/While/Even though] Hong Kong is experiencing economic problems,*acknowledgment* Southeast Asia remains a strong . . . *response*

You can signal an acknowledgment indirectly with *seem*, *appear*, *may*, or *could*, or with an adverb like *plausibly*, *justifiably*, *reasonably*, *surprisingly*, or even *certainly*:

In his letters Lincoln expresses what **[seems/appears]** to be depression.*acknowledgment* But those who observed him . . . *response*

This proposal **[may have/plausibly has]** some

merit,*acknowledgment* but we . . . *response*

You can attribute an objection or alternative to an unnamed source, which gives it a little weight:

It is easy to **[think/imagine/say/claim/argue]** that taxes should . . . *acknowledgment* But there is

[another/alternative/possible] **[explanation/line of argument/account/possibility]**.*response*

Some evidence **[might/may/can/could/does]**

[suggest/indicate/point to/lead some to think] that we should . . . *acknowledgment* but . . . *response*

You can attribute an objection or alternative to a generic interlocutor, giving it more weight:

There are **[some/many/a few]** who **[might/may/could/would]** **[say/think/argue/claim/charge/object]** that Cuba is ^{not} . . . *acknowledgment*
But, in fact, . . . *response*

Although **[some researchers/critics/scholars]** have argued that . . . ,*acknowledgment* our research shows . . .

Note that you can weaken your case if you prematurely denigrate those you disagree with:

Some **naïve** researchers have claimed that . . .

The **occasionally careless** historian H has even claimed that . . .

Save criticism for the response, and direct it at the work rather than the person.

You can acknowledge an objection or alternative in your own voice, using *I* or *we*, a passive verb, or a word or phrase such as *admittedly*, *granted*, *to be sure*, and so on, which concedes it some validity:

I [**understand/know/realize**] that liberals believe
in . . . ,*acknowledgment* but . . . *response*

It is [**true/possible/likely**] that electronic cigarettes are less
carcinogenic than conventional cigarettes. *acknowledgment*
However, . . . *response*

It [**must/should/can**] be

[**admitted/acknowledged/noted/conceded**] that no good evidence
proves that . . . *acknowledgment* Nevertheless, . . .

[**Granted/Certainly/Admittedly/True/To be sure/Of course**], Adams
has claimed . . . *acknowledgment* However, . . . *response*

We [**would/could/can/might/may**] [**say/argue/claim/think**] that public
health programs such as needle exchanges
encourage . . . ,*acknowledgment* but these effects are outweighed
by . . . *response*

10.5.2 Responding to Objections and Alternatives

Begin your response with a term or phrase that signals disagreement, such as *but*, *however*, or *on the other hand*. If readers do not already know the basis for that response, support it with at least one reason or even with a complete subordinate argument.

You can respond in ways that range from tactful to blunt.

You can regret not that the source is unclear, but that *you* don't entirely understand:

But [**I do not quite understand how/I find it difficult to see how/It is not clear to me how**] X can claim that, when . . . *response*

2. Or you can note that there are unsettled issues:

But there are **other issues here** . . . /But there **remains the problem**

of . . . *response*

You can respond more forcefully, claiming the acknowledged position is irrelevant or unreliable:

But as insightful as that may be, *acknowledgment* it **[ignores/is irrelevant to/does not bear on]** the issue at hand. *response*

But the **[evidence/reasoning]** is **[unreliable/shaky/thin]**. *response*

But the argument is **[untenable/weak/confused/simplistic]**. *response*

But the argument **[overlooks/ignores/misses]** key factors. *response*

You have to decide how blunt your response should be. If an alternative seems obviously flawed, say so, but focus on the work rather than the person.

When you think another researcher seems to have not thought through an issue carefully, you usually should say so civilly. Here are a few possibilities:

Smith's evidence is important, *acknowledgment* **but we must look at all the available evidence**. *response*

That explains some of the problem, *acknowledgment* **but it is too complex for a single explanation**. *response*

That principle holds in many cases, *acknowledgment* **but not in all**. *response*

[Quick Tip: Three Predictable Disagreements](#)

There are three kinds of alternatives that at least some readers are likely to think of.

There are causes in addition to the one you claim. If your argument is about cause and effect, remember that no effect has a single cause and no cause has a single effect. If you argue that X causes Y, every reader will think of other causes. European honeybee colonies may be collapsing because of pesticide use, but an informed reader could also list other possible factors, including loss of habitat, disease, genetically modified crops, and parasites. So if you focus on one cause out of many, acknowledge the others. And if you feel readers might think that some cause deserves more attention than you give it, acknowledge that view and explain why you deemphasized it.

What about these counterexamples? No matter how rich your evidence, readers are likely to think of exceptions and counterexamples that they believe undermine your argument. So you must think of them first, acknowledge the more plausible ones, especially if they are vivid, and then explain why you don't consider them as damaging as your reader might. Be particularly wary when you make claims about a phenomenon with a wide range of variation, such as the climate. Readers who do not understand statistical reasoning will focus on an aberrant case, even though it falls within a normal distribution: a cold Fourth of July in Florida does not disprove a claim about global warming, any more than a warm New England Christmas proves it.

I don't define X as you do. To me, X means . . . To accept your claim, readers must accept your definitions, because definitions are crucial warrants (see the next chapter): if you are researching nicotine addiction,

your readers must understand what you mean by that term. Does it mean just a strong craving, a craving that some people can't resist, or a craving that *no one* can? You can find definitions ranging from a few lines in a dictionary to pages in a medical reference work. But regardless of what those sources say, readers tend to redefine terms they encounter to suit their own views. Cigarette manufacturers long argued that cigarettes are not addictive because some people can quit; their critics argued that cigarettes are addictive because more people can't.

When your argument hinges on the meaning of a term, define it to support your solution and offer a subordinate argument for your definition. Don't treat a dictionary definition as authoritative (never begin, "According to *Webster's*, 'addiction' means . . ."). Be aware of plausible alternative definitions that you may need to acknowledge. If you use a technical term that also has a common meaning (like *social class* or *theory*), acknowledge that common meaning and explain why you have adopted the technical one. Conversely, if you do not use a technical term as expert readers expect you to, acknowledge that and explain why you've opted for another meaning.

11 Warrants

Warrants are general principles that connect reasons to claims. This chapter explains when and how to use them. In general, you should state your warrants only when your readers will not understand your argument without them or when you expect your readers to challenge your reasoning. When you write for experts in

a field, you can leave most of your warrants unstated, because your readers will usually know them already and take them for granted.

Consider this argument:

The Russian Federation faces a falling standard of living,*claim* because its birthrate is only 13.2 per 1,000 and life expectancy for men is only about 63 years.*reason*

Someone responds:

Well, you're right about Russia's birthrate and life expectancy, but I don't see how that's relevant to your claim that its standard of living will fall. What's the connection?

How would the person making the argument answer? More important, if that argument were in writing, how would she know that she had to answer that question *before it was asked*? Such questions address the fifth and most complex element of an argument: its warrants. A warrant is a principle that connects a reason to a claim. Warrants are important because readers may challenge not just the validity of a reason but its *relevance* as well.

In this chapter, we explain how warrants work, how to test them, and when and when not to state them. The basic principle is this: state your warrants only if your readers will not be able to understand your reasoning without them, or if you anticipate that your reasoning will be challenged.

But as we get started, a word of caution: everyone struggles to understand warrants—including, from time to time, all of us. So if at the end of this chapter you still have questions, you're not alone.

11.1 WARRANTS IN EVERYDAY REASONING

Warrants are hard to grasp, but we understand them easily enough when people offer proverbs to justify their reasoning. That's because proverbs are warrants that we all know. For example, someone says:

I hear the FBI has been questioning the mayor's staff.*reason* He must be involved in something crooked.*claim*

Another person might object, *You're right. The FBI has been questioning his staff, but why does that mean he's crooked?* To explain the reasoning that led to that conclusion, the first person might offer the proverb, *Well, where there's smoke, there's fire*. That is, when we see a sign of something wrong, we can infer that something is in fact wrong.

The logic behind that reasoning is this. Most proverbs describe a situation made up of two distinct parts: a circumstance (*Where there's smoke, . . .*) and its consequence (*. . . there's fire*). If the connection between the circumstance and consequence is true or reasonable in general, it must also be true or reasonable in specific instances. In the case of smoke, fire, the FBI, and the mayor, that logic looks like this:

We use proverbs to justify many kinds of everyday reasoning: cause and effect (*Haste makes waste*); rules of behavior (*Look before you leap*); reliable inference (*One swallow does not a summer make*). But such proverbs are not our only examples of everyday warrants. We use warrants everywhere: in sports (*Defense wins championships*); in cooking (*Serve oysters only in months with an "r"*); in definitions (*A prime number can be divided only by itself and one*); even in research (*When readers find an error in one bit of evidence, they distrust the rest*).

11.2 WARRANTS IN ACADEMIC ARGUMENTS

In academic arguments, warrants work in exactly the same way. But in contrast to proverbs and other everyday warrants, academic warrants can be difficult to manage—especially for researchers new to a field—for three reasons.

First, academic warrants aren't commonplaces we all share. They are specific principles of reasoning that belong to particular communities of researchers, and they are countless. A fact of life is that it just takes time for new researchers to grasp the warrants of their fields.

Second, experienced researchers rarely state their warrants explicitly when they write for specialized readers in their fields because they can safely assume that these readers already know them. (To state the obvious would seem not helpful but condescending.) This practice serves specialized readers well. But it poses a challenge to novices, who have to figure out what makes some reasons relevant to claims and others not, something those experts take for granted. That's why beginners in any field struggle with the *logic* of arguments written for specialists.

Here's an example of an academic warrant at work. Assuming the available evidence supported the reason, biologists would accept this argument:

A whale is more closely related to a hippopotamus than to a cow,*claim* because it shares more DNA with a hippopotamus.*reason*

No biologist would ask, *What makes DNA relevant to measuring relationship?* So no biologist writing for her colleagues would offer a warrant answering that question. If, however, a non-biologist asked that question, the biologist would answer with a warrant other biologists take for granted:

When a species shares more DNA with one species than it does with another,*circumstance* we infer that it is more closely related to the first.*consequence*

Of course, the biologist would probably then have to explain that warrant as well. The point is this: whether or not a warrant gets stated explicitly depends not only on the argument but also on the audience. Experts state principles that are obvious to other experts only when they communicate with non-experts—or when challenged.

Third, academic warrants are often stated in ways that compress their circumstances and consequences. In most proverbs, these parts are distinct: *Where there's smoke*,*circumstance* *there's fire*.*consequence* But we can also compress those two parts into one short statement: *Smoke means fire*. That's something we rarely do with proverbs but that experts often do with their specialized warrants:

Shared DNA is the measure of the relationship between species.

Phrased this way, our biologist's warrant doesn't explicitly distinguish a circumstance from its predictable consequence. But however compressed a warrant might be, we can always infer those two parts. For purposes of clarity, we'll state warrants in their most explicit two-part form: *When X, then Y*.

11.3 UNDERSTANDING THE LOGIC OF WARRANTS

Here again is that argument about Russia's economic future:

The Russian Federation faces a falling standard of living,^{claim} because its birthrate is only 13.2 per 1,000 and life expectancy for men is only about 63 years.^{reason}

If someone objects that the reason seems *irrelevant* to the claim, the person making the argument would have to justify the connection with a warrant consisting of two parts: (1) a general circumstance that lets us draw a conclusion about (2) a general consequence.

When a nation's labor force shrinks,^{general circumstance} its economic future is
grim.^{general consequence}

Both the circumstance and consequence have to be more general than the specific reason and claim. Visually, that logic looks like this:

That's the same pattern we saw in the argument about smoke, fire, and the crooked mayor.

11.4 TESTING WARRANTS

Readers challenge warrants in predictable ways. Consider this argument:

Contrary to popular belief, gun ownership in America was probably not widespread in the first half of the nineteenth century and before,^{claim} because guns were rarely mentioned in wills.^{reason} A review of 4,465 wills filed in seven states from 1750 to 1850 shows that only 11 percent mention a long gun or handgun.^{report of evidence}

Such a claim is likely to be resisted by those who believe that those who founded the United States owned guns. So even if they accept that the reason is true—that guns were in fact rarely mentioned in wills—they may still object: *But I don't see how that counts as a reason to believe that few people owned a gun. It's irrelevant.*

If a writer anticipated that readers would raise that objection, she would offer a warrant to link the specific reason to the specific claim before she stated them:

In the eighteenth and early nineteenth centuries, valuable objects were listed in wills, **so when someone failed to mention a valuable object in his will, he did not own one.**^{warrant} Since guns were valuable but were rarely mentioned in wills before 1850,^{reason} gun ownership must not have been widespread.^{claim}

But if she wants her readers to accept that warrant, she must ask herself five questions before her readers do:

Is that warrant reasonable?

Is it sufficiently limited?

Is it superior to any competing warrants?

Is it appropriate to this field?

Is it able to cover the reason and claim?

11.4.1 Is Your Warrant Reasonable?

A warrant seems reasonable when readers can accept that its consequence follows from its circumstance. If readers don't accept that, you must first convince them to accept your warrant by treating it as a claim in its own argument, supported by its own reasons and evidence:

In the eighteenth and early nineteenth centuries, valuable objects were listed in wills, so when a will failed to mention such a valuable object, the person did not own one.*.warrant/claim* Watson (1989) confirmed that to be the case.*.reason* In a study of 1,356 wills filed in Cumberland County between 1750 and 1825, he found . . .*.evidence*

11.4.2 Is Your Warrant Sufficiently Limited?

Most warrants are reasonable only within certain limits. For example, that warrant about gun ownership seems to allow no exceptions:

In the eighteenth and early nineteenth centuries, valuable objects were listed in wills.

That version is too broad; it might seem more plausible if it were qualified:

In the eighteenth and early nineteenth centuries, **most** household objects **considered valuable by their owners** were **usually** listed in wills.

But once you start qualifying a warrant with words like *most* and *usually*, you then have to show that its exceptions do not exclude your reason and claim: *What frequency are most and usually? Were guns always considered valuable?*

11.4.3 Is Your Warrant Superior to Any Competing Warrants?

You may think your warrant is reasonable and sufficiently limited, but others might contradict it. Here are two more competing warrants, both arguably reasonable:

When parents believe a medical procedure may harm their children, they have a right to refuse it. Taylor and Chris believe the measles vaccine causes autism, so they can refuse to have it administered to their daughter.

When medical decisions concern matters of public health, the state has a right to regulate them. When most children in a population are vaccinated against measles, everyone is safer, so the state can compel Taylor

and Chris to allow their daughter to be vaccinated.

Which warrant should prevail? That's a matter for yet another argument. You can sometimes reconcile competing warrants by limiting them:

When parents believe a medical procedure may harm their children, they have a right to refuse it, so long as that does not jeopardize the health of others.

When medical decisions concern matters of public health, the state has a right to regulate them, so long as the state encroaches as little as possible on parents' prerogative to make medical decisions for their children.

Finding the right balance is not easy. Again, it's a matter for argument.

11.4.4 Is Your Warrant Appropriate to This Field?

Your warrant may be reasonable, sufficiently limited, and superior to others, but your readers might still reject it if it is not appropriate to their particular research community. Law students get a painful lesson in the law when they find that many warrants they take for granted have no place in legal arguments. For example, like most of us, they start law school holding this commonsense belief:

When a person is wronged, the law should correct it.

But law students have to learn that legal warrants may trump such commonsense ideas. For example:

When one ignores legal obligations, even inadvertently, one must suffer the consequences.

Therefore:

When elderly home owners forget to pay real estate taxes, others can buy their houses for back taxes and evict them.

Against their most decent instincts, law students must learn to argue that justice is not the outcome they believe to be ethical but the one that the law and the courts support.

11.4.5 Is Your Warrant Able to Cover Your Reason and Claim?

Finally, you must be sure that your reason and claim are good instances of your warrant's general circumstance and general consequence. For example:

Ahmed: You should buy a gun,*claim* because you live alone.*reason*

Beth: Why does living alone mean I should buy a gun?

Ahmed: When you aren't safe,*general circumstance* you should protect yourself.*general consequence*

Beth: But living alone doesn't make me unsafe.

Beth objects not that Ahmed's reason is false but that it is not a valid *instance* of his warrant's general *circumstance*. So to her, Ahmed's reason isn't covered by his warrant and is therefore not *relevant*. Beth might also have responded that owning a gun would make her home less safe (rather than more). In that case, she would be objecting that Ahmed's claim isn't a good instance of the warrant's *consequence*, that is, that it doesn't *follow* from his reason: even if she was unsafe, a gun would not allow her to protect herself.

If all this seems complicated, know that you are in good company: the relationship of warrants to claims and reasons has vexed logicians since at least the time of Aristotle. But just knowing the ways that readers typically challenge warrants will help you write better arguments, which is why we've listed those five questions above.

11.5 KNOWING WHEN TO STATE A WARRANT

An argument in any field depends on countless principles of reasoning, but most of these principles are so deeply embedded in our tacit knowledge that we rarely state them. There are three occasions, however, when you may have to:

Your readers are outside your field. When you write as an expert for non-expert readers, you may need to explain how experts draw conclusions and support their claims, especially if these ways of reasoning are unusual.

You use a principle of reasoning that is new or controversial in your field. When you rely on unconventional principles of reasoning, you can anticipate that at least some of your readers will be skeptical. So defuse that skepticism by stating your warrant and then justifying it. Refer to others in your field who also use it. If you can't do that, make an argument of your own defending your reasoning.

You make a claim that readers will resist because they just don't want it to be true. In this case, a good strategy is to start with a warrant that you hope readers will accept *before* you lay out a reason and claim that you fear they will resist. They may not like the claim any better, but you will at least encourage them to see that it is not unreasonable. For example:

We should accept that human actions are largely responsible for climate change,*claim* because virtually all climate scientists hold that view.*reason*

What You Don't Say Says Who You Are

You treat readers courteously when you state and support warrants to explain principles of reasoning that they may not recognize. But you make an equally strong (though less friendly) gesture when you keep silent about warrants you should state for readers not in the know. One way or the other, warrants significantly affect how readers perceive the ethos you project through your arguments.

Some readers may resist that claim because it threatens other strong convictions they hold. A writer confronting such readers might encourage them at least to consider that claim by giving them a warrant that they should be able to accept:

When an overwhelming majority of competent experts arrive at the same conclusion, we can probably trust it.*warrant* We should therefore accept that human actions are largely responsible for climate change,*claim* because virtually all climate scientists hold that view.*reason*

When readers accept that a warrant is reasonable, that a reason is true, and that the reason and claim are good instances of the warrant's general circumstance and consequence, then they are logically obliged at least to consider the claim. If they don't, no rational argument is likely to change their minds.

11.6 USING WARRANTS TO TEST YOUR ARGUMENT

All arguments rely on warrants, even if they aren't stated explicitly. You can test the soundness of an argument by trying to imagine a warrant for it. Here is a flawed argument about how violent video games affect children:

Children aged 12–16 today are significantly more violent than their counterparts from a generation ago.*reason* Brown (2013) has shown

that . . .*evidence* Given these facts, it seems highly likely that violent video games are exerting a destructive influence on today's youth.*claim*

To understand what's wrong here, we can imagine a warrant that would allow us to draw a conclusion about the effect of video games on children:

When children are constantly exposed to images of sadistic violence, they are influenced for the worse.*warrant* Children aged 12–16 today are

significantly more violent than their counterparts from a generation ago.^{reason} Brown (2013) has shown that . . .^{evidence} Given these facts, it seems highly likely that violent video games are exerting a destructive influence on today's youth.^{claim}

Now we can see the problem: the specific circumstance—rising violence among children aged 12–16—is not a valid instance of the warrant's general circumstance: children being exposed to images of sadistic violence.

So even if that statement about rising violence among children is true, it can't justify the claim. To fix that argument, we have to revise the reason to be a good instance of the warrant's general circumstance, which may also mean producing new evidence to support that new reason:

When children are constantly exposed to images of sadistic violence, they are influenced for the worse.^{warrant} Over the past decade, video games have become a major source of children's exposure to violent imagery.^{new reason} Jones (2014) shows that . . .^{new evidence} Given these facts, it seems highly likely that violent video games are exerting a destructive influence on today's youth, making them significantly more violent than their counterparts from a generation ago.^{claim}

Now the reason and claim seem closer to what the warrant covers or include

But a reader keen to derail the argument might still object:

Wait. All those images aren't "sadistic." Much of it is cartoon violence. And children aren't *constantly* exposed to it.

In response, the writer would have to deal with those issues.

Now you understand why important issues are so endlessly contested, why, even when you feel your case is airtight, your readers can still say, *Wait a minute. What about . . . ?* Readers can challenge reasons in two ways. They can object that your reasons are not grounded on sound evidence or that they seem irrelevant to a claim. To answer the first sort of objection, you must find better evidence. To answer the second sort, you must provide a warrant that makes your reasons relevant. If you can't, you must revise your argument.

11.7 CHALLENGING OTHERS' WARRANTS

The most difficult arguments to make are those that challenge not just the claims and evidence that a research community accepts but also the warrants it embraces. No argumentative task is harder, because when you challenge a community's warrants, you ask readers to change not just *what* they believe but *how* they reason. To challenge a warrant successfully, you must first imagine how those who accept it would defend it. Warrants can be based on different *kinds* of supporting arguments, so you have to challenge them in different ways.

11.7.1 Challenging Warrants Based on Experience

We base some warrants on our experience or on reports by others.

When people habitually lie, we don't trust them.

When insecticides leach into the ecosystem, eggshells of wild birds become so weak that fewer chicks hatch and the bird population falls.

To challenge those warrants, you have two choices, both difficult: (1) challenge the reliability of the experience, which is rarely easy; (2) find counterexamples that cannot be dismissed as special cases.

11.7.2 Challenging Warrants Based on Authority

We believe some people because of their expertise, position, or charisma.

When authority X says Y, Y must be so.

The easiest—and friendliest—way to challenge an authority is to argue that, on the matter in question, the authority does not have all the evidence or reaches beyond its expertise. The most aggressive way is to argue that the source is in fact not an authority at all.

11.7.3 Challenging Warrants Based on Systems of Knowledge

These warrants are backed by systems of definitions, principles, or theories:

FROM MATHEMATICS: When we add two odd numbers, we get an even one.

FROM BIOLOGY: When an organism reproduces sexually, its individual offspring differ.

FROM LAW: When we drive without a license, we commit a misdemeanor.

When you challenge these warrants, “facts” are largely irrelevant. You must either challenge the system, always difficult, or show that the case does not fall under the warrant.

11.7.4 Challenging General Cultural Warrants

These warrants are backed not by individual experience but by the common experience of an entire culture. To members of that culture, they seem unassailable “common sense.”

Out of sight, out of mind.

An insult justifies retaliation.

Handling toads causes warts.

Warrants like these may change over time, but slowly. You can challenge them, but readers will resist, because you seem to be challenging their heritage.

11.7.5 Challenging Methodological Warrants

Think of these as “meta-warrants,” general patterns of thought with no content until applied to specific cases. We use them to explain abstract reasoning (they are the source of many proverbs):

GENERALIZATION: When every known case of X has quality Y, then all Xs probably have quality Y. (*Seen one, seen them all.*)

ANALOGY: When X is like Y in most respects, then X will be like Y in other respects. (*Like father, like son.*)

SIGN: When Y regularly occurs before, during, or after X, Y is a sign of X. (*Cold hands, warm heart.*)

Philosophers have questioned these warrants, but in matters of practical argumentation, we challenge only their application or point out limiting conditions: *Yes, we can analogize X to Y, but not if . . .*

11.7.6 Challenging Warrants Based on Articles of Faith

Some warrants are beyond challenge: Jefferson invoked one when he wrote, *We hold these truths to be self-evident, that all men are created equal. . . .*

Others include

When a claim is experienced as revealed truth, it must be true.

When a claim is based on divine teaching, it must be true.

Such warrants are backed not by evidence but by the certainty of those who espouse them. It is pointless to challenge them, because they are statements of faith, impervious to argument or evidence. If you encounter them as you gather your data, ignore them or treat them not as a subject for research but as an inquiry into the meaning of life.

Quick Tip: Reasons, Evidence, and Warrants

You can justify your reasons in two ways: by offering evidence to support them or by deriving them from a warrant. Each of these ways leads to a different kind of argument. Researchers generally trust the first kind more than the second, so base your reasons on solid evidence when you can. Compare these two arguments:

We should do what we can to discourage teenagers from texting and driving,^{*claim*} because distracted driving is a leading cause of teenage deaths.^{*reason*} According to the CDC, motor vehicle accidents are responsible

for over a third of all fatalities among people aged 12–19, and texting while

driving exponentially increases the likelihood that any driver will be involved in one. Moreover, . . .^{*evidence*}

We should do what we can to discourage teenagers from texting and driving,^{*claim*} because when they do, their risk of having an accident increases.^{*reason 1*} Driving is difficult and texting a distraction,^{*reason 2*}

supporting reason 1 and we know that when people are distracted while performing complex tasks, their performance suffers.*warrant linking reason 2 and reason 1*

If you are like most contemporary readers, you probably preferred the first of these arguments. That's because its warrant is not controversial (and therefore goes without saying) and its claim is supported by a reason based on solid evidence. That second argument is plausible because reason 1 and reason 2 are good instances of that warrant's general consequence and condition. But most readers still want evidence.

In particular, you can't support a claim of fact (see 8.1) with a warrant and reason alone:

Texting and driving is a leading cause of teenage deaths,*claim of fact* because texting while driving is very distracting.*reason* When drivers are distracted, they increase their risk of having serious even fatal accidents.*warrant*

Are you thinking, *I could believe that, but I'd like some proof?* That commonsense response is telling. We can't just *reason* our way to the conclusion that texting while driving is a *leading* cause of teen fatalities, or even that it causes teen fatalities *at all*. Except in a few fields—some branches of mathematics, philosophy, theology—the way to demonstrate a claim of fact is to show with evidence that what you are claiming is, *in fact*, the case.

The lesson is this: whenever you can, rely not on elaborate lines of reasoning based on warrants but on hard evidence.

PART IV

Writing Your Argument

Prologue

Planning Again

No formula can tell you when to start drafting. Many writers begin without a full plan, and as things become clearer, they have to discard good but irrelevant pages. Others can't get going without multiple outlines and summaries. And some of us compose drafts in our heads well before turning to a serious draft in writing. You have to find your own way to start a first draft, but you can prepare for that moment if you keep writing your way toward the paper from the start through summaries, analyses, and critiques.

Here's how you know when you're ready to plan a draft:

You know who your readers are, what they know, and why they should care about your problem.

You know the kind of ethos or character you want to project.

You can sketch your question and its answer in two or three sentences.

You can sketch the reasons and evidence supporting your claim.

You know the questions, alternatives, and objections that your readers are likely to raise, and you can respond to them.

You know when your readers may not see the relevance of a reason to a claim and can state the warrant that connects them.

Even when they have a plan and are ready to draft, though, experienced writers know that they won't march straight through to a finished product. They know they'll go down blind alleys, but also make new discoveries, maybe even rethink their whole project. They also know that a lot of their early drafting will not make it into their final draft, and so they start early enough to leave time for revision.

Sorting Out Terms: Hypothesis, Answer, Solution, Claim, Point

In [part II](#) we used the terms *answer*, *hypothesis*, and *solution* to name the sentence that resolved the central issue of your research. In [part III](#) we used the term *main claim* to refer to the answer, hypothesis, or solution that constitutes the key assertion that the rest of your argument supports. Here in [part IV](#) we use *point* to name the sentence that states the main claim in a paper (some use the term *thesis*). *Hypothesis*, *answer*, *solution*, *claim*, and

point—all those terms refer to the same sentence. We use different terms because each defines the role of that sentence from a different angle.

[Part IV](#) will lead you through the process of creating your final paper. In [chapter 12](#) we walk through planning and drafting, then in [chapter 13](#) organizing your argument. In [chapter 14](#) we discuss the demanding task of incorporating and citing sources. In [chapter 15](#) we discuss how to present quantitative data in visual form, and in [chapter 16](#) how to write effective introductions and conclusions. Finally, in [chapter 17](#) we deal with problems of writing in a clear and direct style.

[12 Planning and Drafting](#)

Once you've assembled your argument, you might be ready to draft it. But experienced writers know that time spent planning a first draft more than pays off when they start writing it. A plan helps you organize the elements of your argument into a form that will be both coherent and persuasive to your readers.

Some fields stipulate the plan of a research report. In the experimental sciences, for example, readers expect reports to follow a plan something like this:

Introduction – Methods and Materials – Results – Discussion – Conclusion

If your field requires you to follow a conventional plan, ask your teacher for a model or find one in a secondary source. In most fields, however, you have to create a plan of your own, but that plan must still help readers find what they are looking for.

12.1 PLANNING YOUR PAPER

12.1.1 Sketch a Working Introduction

Writers are often advised to write their introductions last. A few writers can wait until they've written their last words before they write their first ones, but most of us need a working introduction to start us on the right track.

Expect to write your introduction twice, a sketchy one for yourself right now, then later a final one for your readers. That final introduction will usually have three parts (see [chapter 16](#)), so you might as well sketch your working introduction to anticipate them.

At the top of the first page of your storyboard, sketch a *brief* summary of *only* the key points in *only* those sources most relevant to your argument.

An account of marginally relevant references has no place in your introduction. Summarize only the sources that you intend to challenge, modify, or expand on. Then order those sources in a way that is useful to your readers: chronologically, by quality, significance, point of view, and so on. Under *no* circumstances follow the order in which you happened to read them or record them in your notes. If you're sure what will go into this summary, just list the sources in a useful order.

After your summary of sources, rephrase your question as a statement about a flaw or gap that you see in them:

Why is the Alamo story so important in our national mythology?

Few of these historians, however, have explained why the Alamo story has become so important in our national mythology.

Sketch an answer to *So what if we don't find out?* You may be only guessing but try to find *some* answer.

If we understood how such stories become national legends, we would better understand our national values, perhaps even what makes us distinct.

If you can't think of any answer to *So what?*, skip it; we'll return to it in [chapter 13](#).

State the answer to your question as your point, or promise an answer in a launching point. You have two choices here:

State the point of your paper at the end of your introduction to frame what follows and again near the beginning of your conclusion.

State it only in your conclusion, as a climax to your reasoning.

This is a crucial choice, because it creates your social contract with your readers. If you state your main point toward the end of your introduction, you put your readers in charge: *Reader, you control how to read this paper. You know my problem and its solution, my point. You can decide how—even whether—to read on. No surprises.* On the other hand, if you wait until your conclusion to state your main claim, you create a more controlling relationship: *Reader, you must follow me through every twist and turn until we reach the end, where I will finally reveal my point.* Most readers prefer to see your main point at the end of your introduction, because that lets them read what follows faster, understand its relevance better, and remember it all longer. Stating your claim early also helps keep you on track.

Some new researchers fear that if they reveal their main point too early, readers will be “bored” and stop reading. Others worry about repeating themselves. Both fears are baseless. If you ask an interesting question, readers will want to see how well you can answer it.

If you decide to announce your claim only in your conclusion, you still need a sentence at the end of your introduction that launches your reader into the body of your paper. That sentence should include terms that name the key concepts that will run through your paper (see 6.6.1, 8.2.1, 12.1.2). You’ll be better prepared to write that launching sentence after you draft your final introduction. So for purposes of planning, put your main claim at the bottom of your storyboard’s introduction page; you can move it later.

Some writers add a “road map” at the end their introduction:

In part 1, I discuss the issue of . . . Part 2 addresses . . . Part 3 examines . . .

Road maps are common in the social sciences, but many in the humanities find them clumsy. You can add a road map to your storyboard to guide your drafting, then cut it from your final draft. If you keep it, make it short,

Here is how the first page of your storyboard might now look:

Research has shown that female athletes under eighteen have almost twice the risk of sustaining concussions as male athletes of the same age who play

the same sports.*context* [Summary of key sources follows.]

But that research reveals little about the causes of this discrepancy.*question*

rephrased as gap in research

Until we understand why female athletes suffer proportionally more concussions than their male counterparts, we can't know the most effective ways to protect them.*consequences of question*

The discrepancy appears to be due in part to differences in the protective equipment worn by male and female athletes as well as to different standards of monitoring, reporting, and care when injuries occur.*your tentative*

main point

Sketchy as it is, this introduction is enough to start you on track. In your final draft, you'll revise it to state your problem more completely (see [chapter 16](#)).

12.1.2 Identify Key Concepts That Will Run Through Your Whole Paper

For your paper to seem coherent, readers must see a few key concepts running through all of its parts. You might find them among the terms you used to categorize your notes, but they must include keywords from the sentences stating your problem and main point. On the introduction page, circle four or five words that express those concepts. Ignore words that name your general topic; focus on those relevant to your specific question:

employment, job satisfaction, recent SE Asian immigrants, cross-cultural, length of residence, prior economic level

If you find few key terms, your topic and point may be too general (review 8.2.1). List those key terms at the top of each storyboard page, and keep them in mind as you draft.

12.1.3 Plan the Body of Your Paper

Sketch background and define terms. After the introduction page of your storyboard, add a page on which you outline necessary background. You may have to define terms, spell out your problem or review research in more detail, set limits on your project, locate your problem in a larger historical or social context, and so on. Keep it short.

Create a page for each major section of your paper. At the top of each of these pages, write the point that the rest of that section supports, develops, or explains. Usually, this will be a reason supporting your main claim.

Find a suitable order. When you assembled your argument (see 9.1), you ordered its parts in a way that may have been clear to you. But when you plan a draft, you must order them in a way that meets the needs of your readers. When you're not sure what that order should be, consider these options. The first two are based on your topic:

Part-by-part. If you can break your topic into its parts, you can deal with each in turn, but you must still order those parts in a way that helps readers understand them—by their functional relationships, hierarchy, and so on.

Chronological. This is the simplest: earlier to later or cause to effect.

These next six are based on your readers' knowledge and understanding.

Short to long, simple to complex. Most readers prefer to deal with simple issues before they work through more complex ones.

More familiar to less familiar. Most readers prefer to read about more familiar issues before they read about new ones.

Less contestable to more contestable. Most readers move more easily from what they agree with to what they don't.

More important to less important (or vice versa). Readers prefer to read more important reasons first (but those reasons may have more impact if they come last).

Earlier understanding to prepare for later understanding. Readers may have to understand some events, principles, definitions, and so on before they understand something else.

General analysis followed by specific applications. Readers may have to understand the outlines of your overall position before they can follow how you apply it to specific texts, events, situations, and so on.

Often these principles cooperate: what readers agree with and easily understand might also be short and familiar. But these principles may also conflict: readers might reject most quickly reasons that are most important. Whatever your order, it must reflect *your readers'* needs, not the order that the material seems to impose on itself (as in an obvious compare-contrast organization), least of all the order in which those reasons occurred to you.

Finally, make the principle of order you choose clear by sketching at the top of each page words that show it: *First . . . , second . . . ; Later . . . , finally . . . ; More important . . . ; A more complex issue is . . . ; As a result . . .* Don't worry if these terms feel awkward. At this point, they're for your benefit, not your readers'. You can revise or even delete them from your final draft.

12.1.4 Plan Each Section and Subsection

Highlight the key terms in each section and subsection. Just as your paper needs an introduction, so does each of its sections. Earlier we told you to state the point of each section at the top of its storyboard page. Now, just as you picked out key terms to run through your whole paper, circle the ones that uniquely distinguish this section from all the others; they should be in the sentence that states the point of that section. If you cannot find terms to distinguish a section, look closely at how it contributes to the whole. It may offer little or nothing.

Indicate where to put evidence, acknowledgments, warrants, and summaries. Add these parts to the storyboard page for each section. They may, in turn, need to be supported by their own arguments.

Evidence. Most sections consist of evidence supporting a reason. If you have different kinds of evidence supporting the same reason, group and order them in a way that makes sense to readers. Note where you may have to explain your evidence—where it came from, why it's reliable, exactly how it supports a reason.

Acknowledgments and responses. Imagine what readers might object to, then outline a response. Responses may be sub-arguments with a claim, reasons, evidence, and even another response to an imagined response to your response.

Warrants. Generally speaking, if you need a warrant, state it before you offer its claim and supporting reason. This following argument, for example, needs a warrant if it's intended for non-experts in Elizabethan social history:

Since most students at Oxford University in 1580 signed documents with only their first and last names,^{reason} most of them must have been commoners.^{claim}

That argument is clearer to everyone (even experts) when introduced by a warrant:

In late sixteenth-century England, when someone was not a gentleman but a commoner, he did not add “Mr.” or “Esq.” to his signature.^{warrant} Most students at Oxford University in 1580 signed documents with only their first and last names,^{reason} so most of them must have been commoners.^{claim}

If you think readers might question your warrant, make an argument supporting it.

If your paper is long and “fact-heavy” with dates, names, events, or numbers, you might end each major section by briefly summarizing the progress of your argument. What have you established in that section? How does your argument shape up so far? If in your final draft those summaries seem clumsy, cut them.

12.1.5 Sketch a Working Conclusion

State your point again at the top of a conclusion page of your storyboard.

After it, if you can, sketch its significance (another answer to *So what?*).

In doing all this, you may discover that you can't use all the notes you collected. That doesn't mean you wasted time. Research is like gold mining: dig up a lot, pick out a little, toss the rest. Ernest Hemingway said that you know you're writing well when you discard stuff you know is good—but not as good as what you keep.

12.2 AVOIDING THREE COMMON BUT FLAWED PLANS

Not all plans are equally good. Our first efforts often track our thinking or activities as researchers but not the experiences of readers.

Do not organize your paper as a narrative of your thinking. Few readers want to know what you found first, followed by the dead ends you hit, then the problems you overcame. They become especially annoyed when they have to slog through the history of your project to get to a main point you've saved for the end.

To test your draft for this problem, look for sentences that refer not to the results of your research but to how you did it or to what you were thinking. You see signs of this in language like *The first issue was . . . ; Then I compared . . . ; Finally, I conclude*. If you discover more than a few such sentences, you may not be supporting a claim but rather telling the story of how you found it. If so, reorganize your paper around the core elements of your argument—your claim and the reasons supporting it.

Do not assemble your paper as a patchwork of your sources. Readers want *your* analysis, not a summary of your sources. Beginning researchers go wrong when they string together quotations, summaries, and loose paraphrases of sources into a patchwork that reflects little of their own thinking. Such “patch writing” invites the charge *This is all summary, no analysis*. It is a particular risk if you do most of your research online, because it is so easy to cut-and-paste from your sources. Experienced readers recognize patch writing, and you risk a charge of plagiarism (see 14.6).

Advanced researchers rarely offer patchwork summaries, but they can follow sources too closely in another way: they map their paper on to the organization of a major source rather than create a new one that serves their argument better. If the key terms that run through your paper are the same as those in one or more sources, consider whether you are making your own argument or mimicking theirs.

Do not map your paper directly on to the language of your assignment. If you echo the language of your assignment in your first paragraph, your teacher may think that you've contributed no ideas of your own, as in this example:

ASSIGNMENT: Different theories of perception give different weight to cognitive mediation in processing sensory input. Some claim that input

reaches the brain unmediated; others that receptive organs are subject to cognitive influence. Compare two

theories of visual, aural, or tactile perception that take different positions on this matter.

PAPER'S OPENING PARAGRAPH: Different theorists of visual perception give different weight to the role of cognitive mediation in processing sensory input. In this paper I will compare two theories of visual perception, one of which . . .

If your assignment lists a series of issues to cover, avoid addressing them in the order given. If, for example, you were asked to “compare and contrast Freud and Jung on the imagination and unconscious,” you would not have to organize your paper into two parts, the first on Freud and the second on Jung. That kind of organization too often results in a pair of unrelated summaries. Instead, try breaking the topics into their conceptual parts, such as elements of the unconscious and the imagination, their definitions, and so on; then order those parts in a way useful to your readers.

12.3 TURNING YOUR PLAN INTO A DRAFT

Some writers think that once they have an outline or a storyboard, they can just grind out sentences. Experienced writers know better. They know that drafting can be an act of discovery that planning can never replace, because it is then that we often experience one of research's most exciting moments: we discover ideas that we didn't have until we expressed them. But like other steps in the process, even surprises happen better with a plan.

12.3.1 Draft in a Way That Feels Comfortable

Many experienced writers begin to write long before they fill up their storyboard. They create a rough plan, use early drafts to explore what they think, then create a final plan based on what they discover. They know that much of that early writing will not survive, so they start early. Exploratory drafting can help you discover ideas you never imagined, but it works only if you have a distant deadline. If you are new to your topic or have a short deadline, draft when you have a clearer plan.

Start Drafting as Soon as You Can

Deadlines come too soon: we long for another month, a week, just one more day. (We fought deadlines for every edition of this book.) In fact, some researchers seem never able to finish, thinking they have to keep working until their paper, dissertation, or book is perfect. That perfect paper has never been written and never will be. All you can do is to make yours as good as you can in the time available. When you've done that, you can say to yourself: *Reader, after my best efforts, here's what I believe —not the whole or final truth, but a truth important to me and I hope to you. I have tested and supported that truth as fully as time and my abilities allow, so that you might find my argument strong enough to consider, perhaps to accept, maybe even to change what you believe.*

Once they have a plan, many writers draft quickly: they let the words flow, omitting quotations and data that they can plug in later, skipping ahead when they get stuck. If they don't remember a detail, they insert a "[?]" and keep writing until they run out of gas, then go back to look it up. But quick drafters need time to revise, so if you draft quickly, start early.

Other writers can work only slowly and carefully: they have to get every sentence right before they start the next one. To do that, they need a meticulous plan. So if you draft slowly, create a detailed outline or storyboard.

Most writers work best when they draft quickly, revise carefully, and toss what's irrelevant. But draft in any way that works for you.

12.3.2 Use Keywords to Keep Yourself on Track

One problem with drafting is staying on track. A storyboard helps, but you might also keep your key concepts in front of you and, from time to time, check how often you use them, especially those that distinguish each section. But don't let your storyboard or key terms stifle fresh thinking. If you find yourself wandering, follow the trail until you see where it takes you. You may be on the track of an interesting idea.

Even if papers in your field don't use headings and subheadings, we suggest that you do when you draft. Create each heading out of the words that are unique to the section or subsection it heads:

Sam Houston as a Hero in Newspapers Outside of Texas

These headings also show the structure of your paper at a glance (numbered headings are common in some social sciences, rare in the humanities). If your field doesn't use heads, delete them from your final draft.

Quick Tip: Work Through Procrastination and Writer's Block

If you can't start writing or you struggle to draft even a few words, you may have writer's block. Some cases arise from anxieties about school and its pressures; if that might be you, see a counselor. But most cases have causes you can address:

You feel so intimidated by the task that you don't know where to begin. If so, divide the process into small tasks; then focus on one step at a time.

You have set no goals or goals that are too high. If so, create a routine

that sets goals you can meet, then use devices such as a progress chart or regular meetings with a writing partner.

You feel you must make every sentence or paragraph perfect before you move to the next one. You can avoid some obsession with perfection if you write informally along the way, telling yourself you are writing only to help you think on paper. In any event, know that every researcher compromises on perfection to get the job done.

If you have problems like these, go to the student learning center. Advisers there have worked with every kind of procrastinator and blocked writer and can give you advice tailored to your problem.

On the other hand, some cases of writer's block may really be opportunities to let your ideas simmer in your subconscious while they combine and recombine into something new and surprising. If you're stuck but have time (another reason to start early), let your

unconscious work on the problem while you do something else for a day or two. Then return to the task to see if you can get back on track.

13 Organizing Your Argument

This chapter presents a procedure for organizing and revising your drafts so that your argument is as clear to your readers as it is to you. At first this procedure may seem a bit mechanical, but that's its virtue. If you follow it one step at a time, you can analyze and improve the organization of your draft efficiently and reliably.

Some new researchers think that once they've churned out a draft, they're done. The best writers know better. They write a first draft not to show to readers, but to discover what case they can actually make for their point and whether it stands up to their own scrutiny. Then they revise and revise until they think their readers will agree with their argument too. Revising for readers is hard, though, because we all know our own work too well to read it as others will. You must first know what readers look for, then determine whether your draft helps them find it. To do that, you have to analyze your draft objectively; otherwise, you'll just read into it what you want your readers to get out of it.

Some writers resist *any* revising for readers, fearing that if they accommodate their readers, they compromise their integrity. They think that the truth of their discovery should speak for itself, and if readers have a hard time understanding it, well, they just have to work harder. But revising for readers doesn't mean pandering to them. In fact, you only improve your ideas when you imagine drawing readers into an amiable conversation in which they engage your beliefs as you engage theirs.

In this chapter, we show you how to diagnose and revise your organization and argument so that readers get out of it what you think you put into it.

13.1 THINKING LIKE A READER

Readers do not read word by word, sentence by sentence, as if they were adding up beads on a string. They want to begin with a sense of the whole, its structure, and, most important, why they should read your paper in the first place. Then they use that sense of the whole and its aims to interpret its parts. So when you revise, it makes sense to attend first to your overall organization, then to sections, then to the coherence of your paragraphs and the clarity of your sentences, and, finally, to matters of spelling and punctuation. In reality, of course, no one revises so neatly. We all revise as we go, correcting spelling as we rearrange our argument, clarifying evidence as we revise a

paragraph. But when you systematically revise top-down, from global structure to local sentences and words, you are more likely to read as your readers will than if you start at the bottom, with words and sentences, and work up. You will also revise more efficiently, because you won't spend time fine-tuning whole sections that you later decide to rearrange or even cut.

13.2 REVISING YOUR FRAME

Readers must recognize three things instantly and unambiguously:

where your introduction ends

where your conclusion begins

what sentence in one or both states your main point

To ensure that readers recognize these, do this:

Put an extra space after your introduction and before your conclusion. If your field approves, put headings at those joints so that readers can't miss them.

State your main point at or close to the end of your introduction. Then compare that point with the one in your conclusion. They should at least not contradict each other. Nor should they be identical: make the one in your conclusion more specific and contestable.

Include in the point sentence of your introduction key terms that name concepts and themes that run through your paper. Do this not only when your point sentence announces your main claim but also if it is just a launching point (see 12.1.1, 16.4.2).

For example, consider this introductory paragraph (much abbreviated). What does it imply about the point of the paper?

In the eleventh century, the Roman Catholic Church initiated several Crusades to recapture the Holy Land. In a letter to King Henry IV in the year 1074, Gregory VII urged a Crusade but failed to carry it out. In 1095 his successor, Pope Urban II, gave a speech at the Council of Clermont in which he also called for a Crusade, and in the next year, in 1096, he initiated the First Crusade. In this paper I will discuss the reasons for the Crusades.

The closest thing to a point sentence appears to be that vague last one. But it merely announces the Crusades as a topic.

Here are the first few sentences from the first paragraph of the conclusion (again, much abbreviated). What is its point?

The point sentence in the conclusion seems to be the second one (“But their efforts . . . apart”). That point is specific, substantive, and plausibly

contestable. We could add a shortened version of that point to the end of the introduction, or we could write a new sentence for the introduction that, while not revealing the full point, would at least introduce the key concepts of the paper more clearly:

In a series of documents, the popes proposed their Crusades to restore Jerusalem to Christendom, but their words suggest other issues involving **political concerns** about European and Christian **unity** in the face of **internal forces** that were **dividing** them.

13.3 REVISING YOUR ARGUMENT

Once you determine that the outer frame of your paper will work for readers, analyze its argument section by section. We know this seems to repeat earlier steps, but once drafted, your argument may look different from the way it did in your storyboard or outline.

13.3.1 Identify the Substance of Your Argument

Does the structure of your argument match the structure of your paper?

Is each reason supporting your main claim the point of a section of its own? If not, the organizing points of your paper may conflict with the structure of your argument.

Do you strike the right balance between reasons and evidence? In each section, identify everything that counts as evidence, all the summaries, paraphrases, quotations, facts, figures, graphs, tables— whatever you report from a primary or secondary source. If what you identify as evidence and its explanation are less than a third or so of a section, you may not have enough

evidence to support your reasons. If you have lots of evidence but few or no reasons, you may have just a data dump.

13.3.2 Evaluate the Quality of Your Argument

What might cause your readers to reject your argument?

Is your evidence reliable? In [chapter 9](#), we said that evidence should be accurate and precise, sufficient and representative, and authoritative (see 9.4). If you are close to a final draft, it may be too late to find more or better evidence. But you can check other matters:

Check your data and quotations against your notes.

Make sure your readers see how quotations and data relate to your claim.

Be sure you haven't skipped intermediate subreasons between a major reason and its supporting evidence.

Have you appropriately qualified your argument? Can you drop in a few appropriate hedges like *probably*, *most*, *often*, *may*, and so on?

Does your paper read like a conversation with peers or colleagues asking hard but friendly questions? If it reads like a contest between

competitors or if you haven't acknowledged alternative views or objections, go back through your argument and imagine a sympathetic but skeptical reader asking, *Why do you believe that? Are you really making that strong a point? Could you explain how this evidence relates to your point? But what about . . . ?* (Review 10.1–2.) Then answer the most important ones.

Have you expressed all the warrants you should? There is no easy test for this question. Once you identify each section and subsection of your argument, write in the margin its most important unstated warrant. Then ask whether readers will accept it. If not, you have to state and support it.

13.4 REVISING THE ORGANIZATION OF YOUR PAPER

Once you are confident about the outer frame of your paper and the substance of its argument, make sure that readers will find the whole paper coherent. To ensure that they do, check the following:

Do key terms run through your whole paper?

Circle key terms in the main point in your introduction and conclusion.

Circle those same terms in the body of your paper.

Underline other words related to concepts named by those circled terms.

Here again is that concluding paragraph about the Crusades, with its keywords circled:

If readers don't see at least one of those key terms in most paragraphs, they may think your paper wanders.

If you find a passage that lacks key terms, you might shoehorn a few in. If that's difficult, you may have gotten off track and need to rewrite or even discard that passage.

Is the beginning of each section and subsection clearly signaled? Could you quickly and confidently insert headings to mark where your major sections begin? If you can't, your readers probably won't recognize your organization. If you don't use headings, add an extra space at the major joints.

Does each major section begin with words that signal how that section relates to the one before it? Readers must not only recognize where sections begin and end, but understand why they are ordered as they are. Have you signaled the logic of your order with phrases such as

More important . . . , The other side of this issue is . . . , Some have objected that . . . , One complication is . . . , or even just *First, . . .*
Second, . . . ?

Is it clear how each section relates to the whole? For each section ask: *What question does this section answer?* If it doesn't answer one of the five questions whose answers constitute an argument (7.1), does it create a context, explain a background concept or issue, or help readers in some other way? If you can't explain how a section relates to your point, consider cutting it.

Is the point of each section stated in a brief introduction (preferably) or in its conclusion? If you have a choice, state the point of a section at the end of its introduction. Never bury it in the middle. If a section is longer than four or five pages, you might conclude by restating your point and summarizing your argument, especially if your argument is fact-heavy with names, dates, or numbers.

Do terms that unify each section run through it? Each section needs its own key terms to unify and uniquely distinguish it from the others. To test that, create a heading that uniquely distinguishes that section from all the others. Repeat step 1 for each section: find the point sentence and circle in it the key terms for that section (do not circle terms you circled in the main point of the whole paper). Check whether those terms run through that section. If you find no terms that differ from those running through the whole, then your readers may not see what new ideas that section contributes. If you find that some of the terms also run through another section, the two sections may only repeat each another. If so, consider combining them.

13.5 CHECKING YOUR PARAGRAPHS

You may have learned that every paragraph should begin with a topic sentence and be directly relevant to the section in which it appears. Those are good rules of thumb, but applied too strictly they can make your writing seem stiff. The important thing is to structure and arrange your paragraphs so that they lead your readers through the conversation you are orchestrating. Open each paragraph with a sentence or two that signal its key concepts. Doing that will help readers better understand what follows. If your opening doesn't also state the paragraph's point, then your last sentence should. Never bury the point in the middle.

Paragraphs vary in length depending on the type of writing in which they appear. For example, they tend to be shorter in brief research reports and longer in, say, critical essays or book chapters. Paragraphs should be long enough to develop their points but not so long that readers lose focus, which is simply to say they should be "just right" (another Goldilocks moment). If you find yourself stringing together choppy paragraphs of just a few lines, it may mean your points are not well developed. If you find yourself rolling out very long paragraphs of more than a page, it may mean that you are digressing. You can sometimes vary the lengths of your paragraphs for effect: use short paragraphs to highlight transitions or statements that you want to emphasize.

Some writers find it more natural to think not about their paragraphs but about their paragraph breaks. Use your paragraph breaks as you would the pauses in a conversation, for example, to rest after you make a strong point, to give your reader a moment to process a complex passage, or to signal a transition to a new idea.

13.6 LETTING YOUR DRAFT COOL, THEN PARAPHRASING IT

If you start your project early, you'll have time to let your revised draft cool. What seems good one day often looks different the next. When you return to it, don't read straight through; skim its top-level parts: its introduction, the first paragraph of each major section, and its conclusion. Then, based only on what you've read, paraphrase it for someone who hasn't read it. Does the paraphrase hang together? Does it accurately sum up your argument? Even better, ask someone else to skim your paper and summarize it: how well that reader summarizes your argument will predict how well your final readers will understand it. Finally, always consider your reader's advice, even if you do not follow every suggestion.

Quick Tip: Abstracts

An abstract is a paragraph that tells readers what they will find in a paper, an article, or a report. It should be shorter than an introduction but do three things that an introduction does:

- state the research problem

- announce key themes

- state the main point or a launching point that anticipates the main point

Abstracts differ from field to field, and some fields don't use them at all. But most abstracts follow one of three patterns. To determine which suits your field, ask your teacher or look in a standard journal. Here are examples of these patterns, adapted from the abstract to a recent article in political science (the third is the original).

1. Context + Problem + Main Point

This kind of abstract is an abbreviated introduction. It begins with a sentence or two to establish the context of previous research, continues with a sentence or two to state the problem, and concludes with the main result of the research.

Scholars have long assumed that democracy improves the quality of life for its citizens.*.context* But recent research has called this orthodoxy into question, suggesting that there is little or no relationship between a country's regime type and its level of human development.*.problem* In this article, we argue that democracy can be shown to advance human development, but only when considered as a historical phenomenon.*.main point*

2. Context + Problem + Launching Point

This pattern is the same as the previous one, except that the abstract states not specific results, only their general nature (see 12.1.1).

Scholars have long assumed that democracy improves the quality of life for its citizens,*.context* but recent research has called this orthodoxy into question, suggesting that there is little or no relationship between a country's regime type and its level of human development.*.problem* In this article, we review this body of work, develop a series of causal pathways through which democracy might improve social welfare, and test two hypotheses: (a) that a country's level of democracy in a given year affects its level of human development and (b) that its stock of democracy over the past century affects its level of human development.*.launching point*

3. Summary

A summary also states the context and the problem; but before reporting the result, it summarizes the rest of the argument, focusing either on the evidence supporting the result or on the procedures and methods used to achieve it. Here is the abstract as it was published:

Does democracy improve the quality of life for its citizens? Scholars have long assumed that it does,*.context* but recent research has called this orthodoxy into question.*.problem* This article reviews this body of work, develops a series of causal pathways through which democracy might improve social welfare, and tests two hypotheses: (a) that a country's level of democracy in a given year affects its level of human development and (b) that its stock of democracy over the past century affects its level of human development. Using infant mortality rates as a core measure of human development, we conduct a series of time-series—cross-national statistical tests of these two hypotheses. We find only slight evidence for the first

proposition, but substantial support for the second.*summary* Thus, we argue that the best way to think about the relationship between democracy and development is as a time-dependent, historical phenomenon.*main point*

Since this version includes a summary, the statement of the problem is slightly abbreviated. Notice, too, the opening sentence. Rather than stating the context in standard fashion, this version begins with what seems to be a rhetorical question—“Does democracy improve the quality of life for its citizens?”—just so it can then upend the implied answer. Even as compressed a form as an abstract allows for the occasional stylistic flourish.

A final tip: if you publish your research, some researcher down the line may want to find it, using a search engine that looks for keywords. So imagine searching for your paper yourself. What keywords would you look for? Put them in your title and the first sentence of your abstract.

14 Incorporating Sources

Nothing sets the experienced researcher apart from the beginner more than the effective use of sources. But even a beginning researcher can project an ethos of credibility by following a few principles that show respect both for the writer's sources and for readers.

14.1 QUOTING, PARAPHRASING, AND SUMMARIZING APPROPRIATELY

You must build your paper out of your own words that reflect your own thinking. But you'll support much of that thinking with quotations, paraphrases, and summaries. As we've said, different fields use them differently: researchers in the humanities quote more than do social and natural scientists, who typically paraphrase and summarize. But you must decide each case for itself, depending on how you use the information. Here again are some principles:

Summarize when details are irrelevant or a source isn't important enough to warrant much space. Paraphrase when you can state what a source says more clearly or concisely or when your argument depends on the details in a source but not on its specific words.

Quote for these purposes:

—The words themselves are evidence that backs up your reasons. —The words are from an authority who backs up your claims. —The words are strikingly original or express your key concepts so compellingly that the quotation can frame an extended discussion. —A passage states a view that you disagree with, and to be fair you want to state it exactly.

For every summary, paraphrase, or quotation you use, cite its bibliographic data in the appropriate style (see 14.5 and the Quick Tip). Under no circumstances stitch together downloads from the Web with a few sentences of your own. Teachers grind their teeth reading such papers, dismayed by their lack of original thinking. Readers of advanced projects reject such patchworks out of hand.

14.2 INTEGRATING DIRECT QUOTATIONS INTO YOUR TEXT

Signal direct quotations in one of two ways:

For four or fewer quoted lines, run them into your text, surrounded by quotation marks.

For five or more lines, set them off as an indented block.

You can insert run-in and block quotations in your text in three ways.

Drop in the quotation with a few identifying words (*Author says, According to Author, As Author puts it, etc.*).

Diamond says, “The histories of the Fertile Crescent and China . . . hold a salutary lesson for the modern world: circumstances change, and past primacy is no guarantee of future primacy” (417).

- Introduce the quotation with a sentence that interprets or characterizes it.

Diamond suggests what we can learn from the past: “The histories of the Fertile Crescent and China . . . hold a salutary lesson for the modern world . . .” (417).

Weave the grammar of the quotation into the grammar of your own sentence.

Diamond suggests that the chief “lesson for the modern world” in the history of the Fertile Crescent and China is that “circumstances change, and past primacy is no guarantee of future primacy” (417).

You can modify a quotation, so long as you don’t change its meaning and you signal deletions with three dots (called *ellipses*) and changes with square brackets. This sentence quotes the original intact:

Posner focuses on religion not for its spirituality, but for its social functions: “A notable feature of American society is religious pluralism, and we should consider how this relates to the efficacy of governance by social norms in view of the historical importance of religion as both a source and enforcer of such norms” (299).

This version modifies the quotation to fit the grammar of the writer’s sentence:

In discussing religious pluralism, Posner says that “a notable feature of American society is [our] religious pluralism” and notes how social norms affect “the efficacy of governance . . . in view of the historical importance of religion as both a source and enforcer of such norms” (299).

14.3 SHOWING READERS HOW EVIDENCE IS RELEVANT

By this point you may be so sure that your evidence supports your reasons that you’ll think readers can’t miss its relevance. But evidence never speaks for itself, especially not long quotations or complex sets of numbers. You must speak for such evidence by introducing it with a sentence stating what you want your readers to get out of it. For example, this passage bases a claim about Hamlet on the evidence of the following quotation:

When Hamlet comes upon his stepfather, Claudius, at prayer, he demonstrates cool rationality:*claim*

Now might I do it [kill him] pat, now ’a is a-praying, And now I’ll do’t.
And so ’a goes to heaven,

And so am I reveng’d. . . . [Hamlet pauses to think] [But this] villain
kills my father, and for that, I, his sole son, do this same villain send
To heaven.

Why, this is hire and salary, not revenge. (3.3)*report of evidence*

It is not clear how that quotation supports the claim, because nothing in it specifically refers to Hamlet’s rationality. In contrast, compare this:

When Hamlet comes upon his stepfather, Claudius, at prayer, he demonstrates cool rationality.*claim* **He impulsively wants to kill Claudius**

but pauses to reflect: if he kills Claudius while praying, he will send his soul to heaven, but he wants Claudius damned to hell, so he coolly decides to kill him later:*reason*

Now might I do it [kill him] pat, . . .*report of evidence*

Now we see the connection. (Do the same with tables and figures; see 15.3.1.)

Lacking a reason that explains the evidence, readers may not see what it *means*. So introduce complex evidence with a sentence explaining it.

14.4 THE SOCIAL IMPORTANCE OF CITING SOURCES

14.4.1 Citations Benefit You

Citations protect you from a charge of plagiarism, but beyond that narrow self-interest, correct citations contribute to your ethos. First, readers don't trust sources they can't find. If they can't find your sources because you failed to document them adequately, they won't trust your evidence; and if they don't trust your evidence, they won't trust your paper—or you. Second, many experienced researchers think that if a writer can't get the little things right, he can't be trusted on the big ones. Getting the details of citations right distinguishes reliable, experienced researchers from careless beginners. Finally, teachers assign research papers to help you learn how to integrate the research of others into your own thinking. Proper citations show that you have learned one important part of that process.

14.4.2 Citations Help Your Readers

Readers use citations before, while, and after they read your paper. Before, many experienced readers will preview your paper by skimming your list of sources to see whose work you read and whose you didn't. As they read, readers use citations to decide how much they can trust the reliability, currency, and completeness of your evidence. Papers with outdated or only very recent citations of sources found on the Internet alert readers to be skeptical. But papers whose citations show range and depth in engaging sources reassure readers. Finally, just as you depended on sources to start your bibliographical trail, so will some readers depend on *your* list to start theirs.

14.4.3 Citations Honor Your Sources

Finally, citations honor your sources. Few academic researchers get rich writing on topics such as “Ohio education, 1825–1850.” Their reward isn't money; it's the reputation they earn for doing good work and the pleasure they take in knowing that colleagues respect it enough to cite it—even in disagreement. Your sources may never know you cited them, but that doesn't matter. When you cite sources, you honor them by acknowledging your intellectual debts.

In short, when you cite sources fully and accurately, you sustain and enrich the sense of community that gives written research both its scholarly and social value.

14.5 FOUR COMMON CITATION STYLES

It would be easier if we all cited sources in the same style, but we don't. For academic research, there are two basic patterns, each with two common versions. The many differences among the styles can seem picky and irrelevant, but they matter to readers. So be sure to find out which style you should use, and consult the proper guide for your style. (You can also find reliable online guides.)

Many researchers today use citation software that automatically generates citations in the style they choose. Some teachers encourage this practice. Others feel that students should not rely on such assistance, but rather learn the details. If you don't know where your teacher stands on the issue, ask.

14.5.1 Two Basic Patterns: Author-Title and Author-Date

All citation forms begin with the name of the author, editor, or whoever else is responsible for the source. We distinguish styles by what follows the author. If the title follows the author, the style is called *author-title*.

Anes, Lee J. *A Story of Ohio: Its Early Days*. Boston: Hobson Press, 1988.

This pattern is common in the humanities.

If the date follows the author, the style is called *author-date*.

Anes, Lee. 1988. *A story of Ohio: Its early days*. Boston: Hobson Press.

This pattern is used in the natural sciences and most of the social sciences, because in those rapidly changing fields, readers want to know quickly how old a source is. They can spot dates more easily when they come at the beginning of a citation.

14.5.2 Two Author-Title Styles

There are two versions of author-title style, each based on a well-known style manual.

Chicago Author-Title Style: *The Chicago Manual of Style*, 16th ed.

(Chicago: University of Chicago Press, 2010). It is sometimes called

Turabian style, based on a widely used condensed manual: Kate L.

Turabian, *A Manual for Writers of Research Papers, Theses, and Dissertations*, 8th ed. (Chicago: University of Chicago Press, 2013). When using this style, you list your sources in a bibliography and cite them in your text with footnotes or endnotes.

MLA Style: *MLA Handbook for Writers of Research Papers*, 8th ed.

(New York: Modern Language Association, 2016). You are mostly likely to learn MLA (Modern Language Association) style in a literature or composition course. In this style, you give a list of works cited and cite your sources parenthetically in your text.

These styles differ only in minor details, but those details matter, so be sure to consult the proper style guide.

14.5.3 Two Author-Date Styles

There are two versions of author-date style, each based on a well-known style manual.

Chicago Author-Date Style: This style is also described in *The Chicago Manual of Style* and sometimes called Turabian style. When using it, you list your sources in a bibliography but cite them parenthetically in your text.

APA Style: *Publication Manual of the American Psychological*

Association, 6th ed. (Washington, DC: American Psychological Association, 2009). This style uses parenthetical citations as well.

Like the author-title styles, these styles differ only in minor details. But again, those details matter, so be sure to follow the prescriptions of the style you use down to the last comma, space, and capital letter.

14.6 GUARDING AGAINST INADVERTENT PLAGIARISM

It will be as you draft that you risk the worst mistake a researcher can make: you lead readers to think that you're trying to pass off as your own the work of another writer. Do that and you risk an accusation of plagiarism, a charge that, if sustained, could mean, for a professional writer, an irreparably damaged reputation or, for a student writer, a failing grade or even expulsion. Students know they cheat when they put their name on a paper purchased on the Internet or copied from a fraternity or sorority file. Most also know they cheat when they pass off as their own long passages copied directly from their sources. For those cases, there's nothing to say beyond *Don't*.

But many inexperienced writers don't realize when they risk being charged with plagiarism because they are careless or misinformed. You run that risk when you do any of the following:

You quote, paraphrase, or summarize a source but fail to cite it.

You use ideas or methods from a source but fail to cite it.

You use the exact words of a source and you do cite it, but you fail to put those words in quotation marks or in a block quotation.

You paraphrase a source and cite it, but you use words so similar to those of the source that anyone can see that as you paraphrased, you followed the source word by word.

14.6.1 Cite the Source of Every Quotation, Paraphrase, or Summary

You must cite your source every time you use its words, even if you only paraphrase or summarize them. If the quotations, paraphrases, or summaries come from different pages of your sources, cite each one individually. If a paraphrase or summary extends over several paragraphs, cite it only once at the end. (See the Quick Tip at the end of this chapter for guidance on citing sources in your text.)

The most common problem is not that students don't know that they should cite a source, but that they lose track of which words are theirs and which are borrowed. That's why we urged you in [chapter 6](#) to distinguish in your notes between quotations, paraphrases, and summaries of sources and your own analyses, thoughts, and commentary. Always include the citation as soon as you add a quotation because you may

not remember to do so later. Be especially careful to cite a paraphrase or summary as you draft it; otherwise, you may not even remember that it originated with a source.

14.6.2 Signal Every Quotation, Even When You Cite Its Source

Even if you cite the source, readers must know exactly which words are not yours, even if they are *as few as a single line*. It gets complicated, however, when you copy less than a line. Read this:

“Because technology begets more technology, the importance of an invention’s diffusion potentially exceeds the importance of the original invention. Technology’s history exemplifies what is termed an autocatalytic process: that is, one that speeds up at a rate that increases with time, because the process catalyzes itself” (Diamond 1998, 301).

If you were writing about Jared Diamond’s ideas, you would probably have to use some of his words, such as *the importance of an invention*. But you wouldn’t put that phrase in quotation marks, because it shows no originality of thought or expression.

Two of his phrases, however, are so striking that they do require quotation marks: *technology begets more technology* and *autocatalytic process*. For example:

The power of technology goes beyond individual inventions because “technology begets more technology.” It is, as Diamond puts it, an “autocatalytic process” (301).

Once you cite those words, you can use them again without quotation marks or citation:

As one invention begets another one and that one still another, the process becomes a self-sustaining catalysis that spreads across national boundaries.

This is a gray area: words that seem striking to some are not to others. If you put quotation marks around too many ordinary phrases, readers might think you’re naive, but if you fail to use them when readers think you should, they may suspect you of plagiarism. Since it’s better to seem naive than dishonest, especially early in your career, use quotation marks freely. (You must, however, follow the standard practices of your field. Lawyers, for example, often use the exact language of a statute or judicial opinion with no quotation marks.)

14.6.3 Don't Paraphrase Too Closely

You paraphrase appropriately when you represent an idea in your own words more clearly or pointedly than the source does. But readers will think that you plagiarize if they can match your words and phrasing with those of your source.

For example, here is a passage from Malcolm Gladwell's *Outliers: The Story of Success*:

"Achievement is talent plus preparation. The problem with this view is that the closer psychologists look at the careers of the gifted, the smaller the role innate talent seems to play and the bigger the role preparation seems to play" (38).

This too-close paraphrase is plagiarism:

Success seems to depend on a combination of talent and preparation. However, when psychologists closely examine the gifted and their careers, they discover that innate talent plays a much smaller role than preparation (Gladwell 38).

This paraphrase does not plagiarize:

As Gladwell observes, summarizing studies on the highly successful, we tend to overestimate the role of talent and underestimate that of preparation (38).

This phrasing is not a close match to the original. And notice that we chose not to put *talent* or *preparation* in quotes. We decided that those words are common enough to use as our own.

To avoid seeming to plagiarize, read the passage, look away, think about it for a moment; *then still looking away*, paraphrase it in your own words. Then check whether you can run your finger along your sentence and find synonyms for the same ideas in the same order in your source. If you can, try again.

14.6.4 Usually Cite a Source for Ideas Not Your Own

Most of our ideas are based on sources somewhere in history. But readers don't expect you to cite a source for the idea that the world is round. They do, however, expect you to cite a source for an idea when (1) the idea is associated with a specific person *and* (2) it's new enough *not* to be part of a field's common knowledge. For example, psychologists

claim that we think and feel in different parts of our brains. But no reader would expect you to cite a source for that idea, because it's so familiar that no one would think you are implying it is yours. On the other hand, some psychologists argue that emotions are crucial to rational decision making. That idea is so new and tied to particular researchers that you'd have to cite them.

14.6.5 Don't Plead Ignorance, Misunderstanding, or Innocent Intentions

Some students sincerely believe that they don't have to cite material downloaded from the Web because it's free and publicly available. They are wrong. Other students defend themselves by claiming they didn't *intend* to mislead. Well, we read words, not minds. Here is how to think about this issue: If the person you borrowed from read your writing, would she recognize your words or ideas as her own, including paraphrases, summaries, or even general ideas or methods? If so, you must cite that source and enclose any of her exact words in quotation marks or set them off in a block quotation. No exceptions, no excuses.

Why the Fuss over Honest Mistakes?

Some students wonder why teachers are so unforgiving of honest slip-ups. *What's the harm?*

First, they harm your credibility. One failure to acknowledge a source can lead readers to doubt your honesty, a career-ending judgment for an advanced student. But they matter even to a beginner. Your teacher is preparing you to write not for her but for others who will have only your words to judge your ethos. She needs to see that you know not only how to use sources thoughtfully but how to acknowledge them carefully and completely.

Other students think plagiarism is a victimless offense. It is not. Recently, two young scholars were praised when they used in a new way

methods and ideas published twenty years earlier. They mentioned their source in passing but failed to acknowledge their specific debt fully. In doing so, they not only claimed undeserved credit but deprived the older scholar of credit he deserved. Worse, by omitting the bibliographical trail that led to his work, they kept readers from rediscovering it. The credit he lost cost him not only reputation but also perhaps grants, promotions, and ultimately higher pay.

Quick Tip: Indicating Citations in Your Paper

You must indicate in your paper every place where you use a source. The three of the four most common citation styles—Chicago author-date style, MLA style, and APA style (see 14.5)—use parenthetical citations that direct readers to specific pages in the source, with enough information to find the corresponding entry in a list of sources.

Some have claimed that Castro would reform Cuban politics (Smith 1999, 233).

If you use Chicago author-title style, you may instead use a raised number, or superscript, that directs readers to a correspondingly numbered note at the bottom of the page or at the end of the paper.

Some have claimed that Castro would reform Cuban politics.⁵

5. George Smith, *Travels in Cuba* (Boston: Hasbro Press, 1999), 233.

PARENTHETICAL CITATIONS

A parenthetical (or in-text) citation includes only the information a reader needs to locate the source in a list of sources at the end of your paper. Depending on your field, that list will be called your bibliography, references, or works cited. What you include in an in-text citation depends first on whether you use author-title or author-date citation style. For example, here are the author-title forms for citing a single-author work if you do not mention the author in your sentences and you have only one work by that author in your list of sources:

Chicago Author-Title (Author, page[s])

Only one writer provides data on this matter (Kay, 220).

MLA (Author page[s])

Only one writer provides data on this matter (Kay 220).

If in your list of sources you list more than one publication for an author, you must add a short title so that readers will know which publication you are citing. In this case, the format in both styles is the same:

Chicago Author-Title and MLA (Author, *Short Title*, page[s]) Only one writer provides data on this matter (Kay, *A Life*, 220).

In author-date style, you must add the date to every citation:

Chicago Author-Date (Author date, page[s])

Only one writer provides data on this matter (Kay 2006, 220).

APA (Author, date, p. xxx)

Only one writer provides data on this matter (Kay, 2006, p. 220).

If you have mentioned the author, drop the name from the citation:

Chicago Author-Date: Kay is the only writer who provides data on this matter (2006, 220).

MLA: Kay is the only writer who provides data on this matter (220).

APA: Kay is the only writer who provides data on this matter (2006, p. 220).

There are additional rules for citations if a work has more than one author, if you cite more than one work by the same author, and so on. For these, consult the appropriate guide.

NOTES AND BIBLIOGRAPHY

In Chicago author-title style, you use notes—footnotes at the bottom of the page or endnotes following the paper—to direct readers to sources in a bibliography. Notes include the same information as a bibliography entry, but the form differs in three ways: notes list names not last name, first name, but first name last name; individual elements of a note are separated by commas rather than periods; and publication data are in parentheses.

NOTE FORM: 5. George Smith, *Travels in Cuba* (Boston: Hasbro Press, 1999), 233.

BIBLIOGRAPHY FORM: Smith, George. *Travels in Cuba*. Boston: Hasbro Press, 1999.

For details, consult the Turabian guide or *The Chicago Manual of Style*. Researchers are increasingly using parenthetical citations rather than notes, because notes duplicate the information listed in a bibliography. If in doubt, ask your teacher.

15 Communicating Evidence Visually

Most readers grasp quantitative evidence more easily in tables, charts, and graphs than they do in words. But some visual forms suit particular data and messages better than others. In this chapter, we show you how to choose the graphic form that best helps readers both grasp your data and understand how they support your argument.

15.1 CHOOSING VISUAL OR VERBAL REPRESENTATIONS

When the data are few and simple, readers can grasp them as easily in a sentence as in a table:

In 2013, on average, men earned \$50,033 a year and women \$39,157, a difference of \$10,876.

TABLE 15.1. Male-female salaries (\$), 2013

But if you present more than a few numbers, readers will struggle to keep them straight:

Between 1970 and 2010, the structure of families changed in two ways. In 1970, 85 percent of families had two parents, but in 1980 that number declined to 77 percent, then to 73 percent in 1990, to 68 percent in 2000, and to 64 percent in 2010. The number of one-parent families rose, particularly families headed by a mother. In 1970, 11 percent of families were headed by a single mother. In 1980, that number rose to 18 percent, in 1990 to 22 percent, and to 23 percent in 2000. There were some marginal changes among single fathers (headed 1 percent of the families in 1970, 2 percent in 1980, 3 percent in 1990, and 4 percent in 2000). Families headed by no adult remained stable at 3–4 percent.

A note on terminology: We use the term *graphics* for all visual representations of data. Traditionally, graphics are divided into *tables* and *figures*. A table is a grid with columns and rows. Figures are all other graphic forms, including graphs, charts, photographs, drawings, and diagrams. Figures that present quantitative data are divided into *charts* and *graphs*. Charts typically consist of bars, circles, points, or other shapes; graphs consist of continuous lines.

15.2 CHOOSING THE MOST EFFECTIVE GRAPHIC

When you graphically present data as complex as in that paragraph, the most common choices are tables, bar charts, and line graphs, each of which has a distinctive rhetorical effect.

A table seems precise and objective. It emphasizes discrete numbers and requires readers to infer relationships or trends on their own (unless you state them in an introductory sentence)

Charts and line graphs present a visual image that communicates values less precisely than do the exact numbers of a table but with more impact. But charts and graphs also differ. A bar chart emphasizes contrasts among discrete items:

How many choices you should consider depends on your experience. If you're new to quantitative research, limit your choices to basic tables, bar charts, and line graphs. Your computer software offers more choices, but ignore those that you aren't familiar with. If you're doing advanced research, readers will expect you to draw from a larger range of graphics favored in your field. In that case, consult [table 15.7](#), which describes the rhetorical uses of other common forms. You may have to consider even more creative ways of representing data if you are writing a dissertation or article in a field that routinely displays complex relationships in large data sets. (See the bibliography for additional resources.) What follows is a guide to the basics of tables, charts, and graphs.

15.3 DESIGNING TABLES, CHARTS, AND GRAPHS

Computer programs create graphics so dazzling that many writers let their software determine their design. That's a mistake. Readers don't care how fancy a graphic looks if it doesn't communicate your point clearly. Here are some principles for designing effective graphics. To follow them, you may have to change default settings in your graphics software.

15.3.1 Frame Each Graphic to Help Readers Understand It

A graphic representing complex numbers rarely speaks for itself. You must frame it to show readers what to see in it and how to understand its relevance to your argument:

Label every graphic in a way that describes its data. For a table, the label is called a *title* and is set flush left above the table; for a figure, the label is called a *legend* and is set flush left below the figure. Keep titles and legends short but descriptive enough to distinguish every graphic from every other one.

- Avoid making the title or legend a general topic.

NOT: Heads of households

BUT: Changes in one- and two-parent heads of households, 1970–2010

Do not give background information or characterize what the data imply.

NOT: Weaker effects of counseling on depressed children before professionalization of staff, 1995–2004

BUT: Effect of counseling on depressed children, 1995–2004

Be sure labels distinguish graphics presenting similar data. **NOT:** Risk factors for high blood pressure

BUT: Risk factors for high blood pressure among men in Cairo, Illinois

OR: Risk factors for high blood pressure among men in St. Louis, Missouri

Insert into the table or figure information that helps readers see how the data support your point. For example, if numbers in a table show a trend

and the size of the trend matters, indicate the change in a final column. If a line on a graph changes in response to an influence not mentioned on the graph, add text to the image to explain it.

Although reading and math scores declined by almost 100 points following redistricting, that trend reversed when supplemental math and reading programs were introduced.

Introduce the table or figure with a sentence that explains how to interpret it. Then highlight what it is in the table or figure that you want readers to focus on, particularly any number or relationship mentioned in that introductory sentence. For example, we have to study [table 15.3](#) to understand how it supports the sentence before it:

Most predictions about increased gasoline consumption have proved wrong.

15.3.2 Keep All Graphics as Simple as Their Content Allows

Some guides encourage you to cram as much data as you can into a graphic. But readers want to see only the data relevant to your point, free of distractions. For all graphics:

Include only relevant data. If you include data only for the record, label it accordingly and put it in an appendix.

Keep the visual impact simple.

Box a graphic only if you group two or more figures.

Do not color or shade the background.

FOR TABLES

Never use both horizontal and vertical dark lines to divide columns and rows. Use light gray lines only if the table is complex or you want to direct your reader's eyes in one direction to compare data.

For tables with many rows, lightly shade every fifth row.

FOR CHARTS AND GRAPHS

Use background grid lines only if the graphic is complex or readers need to see precise numbers. Make them light gray.

Color or shade lines or bars only to show a contrast. Use color only if

the text will be printed in color and not photocopied later. (Black-and-white photocopies make many colors look alike.)

Never use iconic bars (for example, images of cars to represent automobile production) or add a third dimension merely for effect. Both look amateurish and can distort how readers judge values.

Plot data on three dimensions only when your readers are familiar with such graphs and you cannot display the data in any other way.

Use clear labels.

Label all rows and columns in tables and both axes in charts and graphs.

Use tick marks and labels to indicate intervals on the vertical axis of a graph.

If possible, label lines, bar segments, and the like on the image rather than in a legend set to the side. Use a legend only if labels would make the image too complex to read.

When specific numbers matter, add them to bars or segments in charts or to dots on lines in graphs.

15.4 SPECIFIC GUIDELINES FOR TABLES, BAR CHARTS, AND LINE GRAPHS

15.4.1 Tables

Tables with lots of data can seem dense, so organize them to help readers.

Order the rows and columns by a principle that lets readers quickly find what you want them to see. Do not automatically choose alphabetic order.

Round numbers to a relevant value. If differences of less than 1,000 don't matter, then 2,123,499 is irrelevantly precise.

Sum totals at the bottom of a column or at the end of a row, not at the top or left.

15.4.2 Bar Charts

Bar charts communicate as much by visual impact as by specific numbers. But bars arranged in no pattern imply no point. If possible, group and arrange bars to create an image that matches your message. For example, look at [figure 15.4](#) in the context of the explanatory sentence before it. The items are listed alphabetically, an order that doesn't help readers see the point.

Most of the world's deserts are concentrated in North Africa and the Middle East

Figure 15.4. World's ten largest deserts

In contrast, [figure 15.5](#) supports the claim with a coherent image.

Most of the world's deserts are concentrated in North Africa and the Middle East.

Figure 15.5. World distribution of large deserts

In standard bar charts, each bar represents 100 percent of a whole. But sometimes readers need to see specific numbers for parts of the whole. You can do that in two ways:

Divide the bars into proportional parts, creating a "stacked" bar.

Give each part of the whole its own bar, then group the parts into clusters.

Use stacked bars only when you want readers to compare whole values for different bars rather than their divided segments, because readers can't easily compare the proportions of segments by eye alone. If you do use stacked bars, do this:

Arrange segments in a logical order. If possible, put the largest segment at the bottom in the darkest shade.

Label segments with specific numbers and to assist comparisons; connect corresponding segments with gray lines.

Compare figures [15.6](#) and [15.7](#):

Figure 15.6. World generation of nuclear energy, 1980–1999

Figure 15.7. Largest generators of nuclear energy, 1980–1999

If you group bars because segments are as important as the wholes, do this:

Arrange groups in a logical order; if possible put bars of similar size next to one another (order bars in the same way through all the groups).

Label groups with the number for the whole, either above each group or below the labels on the bottom.

Most data that fit a bar chart can also be shown in a pie chart. Pie charts are popular in magazines, tabloids, and annual reports. While splashy, they are harder to read than bar charts. Readers must compare proportions of segments whose sizes are often hard to judge. But pie charts have their place, especially to communicate qualitative impressions about the comparative size of data, either to show that one segment is disproportionately larger than the rest or that the data is divided into many small segments. Avoid using pie charts to convey quantitative data, however. Use bar charts instead.

15.4.3 Line Graphs

Because a line graph emphasizes trends, readers must see a clear image to interpret it correctly. Do the following:

Choose the variable that makes the line go in the direction, up or down, that supports your point. If the good news is a reduction (down) in high school dropouts, you can more effectively represent the same data as a rising line indicating increase in retention (up). If you want to emphasize bad news, find a way to represent your data as a falling line.

Plot more than six lines on one graph only if you cannot make your point in any other way.

If you have fewer than ten or so data points, indicate them with dots. If only a few are relevant, insert numbers to show their exact value.

Do not depend on different shades of gray to distinguish lines, as in [figure 15.8](#).

Compare [figure 15.8](#) and [figure 15.9](#):

Figure 15.8. Foreign-born residents in the United States, 1870–1990

Figure 15.9. Foreign-born residents in the United States, 1870–1990

[Figure 15.8](#) is harder to read because the shades of gray do not distinguish the lines well against the background and because our eyes have to flick back and forth to connect the lines to the legend. [Figure 15.9](#) makes those connections clearer.

These different ways of showing the same data can be confusing. To cut through that confusion, test different ways of representing the same data. Construct alternative graphics; then ask someone unfamiliar with the data to judge them for impact and clarity. Be sure to introduce the figures with a sentence that states the claim you want the figure to support.

15.5 COMMUNICATING DATA ETHICALLY

Your graphic must be not only clear and accurate, but honest. Do not distort the image of the data to make your point. For example, the two bar charts below display identical data, yet imply different messages:

Figure 15.10. Capitol City pollution index, 1982–1994

The 0–100 scale in the figure on the left creates a fairly flat slope, which makes the drop in pollution seem small. The vertical scale in the figure on the right, however, begins not at 0 but at 80. When a scale is so truncated, it creates a sharper slope that exaggerates small contrasts.

Graphs can also mislead by implying false correlations. Someone might claim that unemployment goes down as union membership goes down and offer [figure 15.11](#) as evidence. And indeed, in that graph, union membership and the unemployment rate do seem to move together so closely that a reader might infer one causes the other:

Figure 15.11. Union membership and unemployment rate, 1993–1999

But the scale for the left axis (union membership) differs from the scale for the right axis (the unemployment rate), making it seem that the two trends could be causally related. They may be, but that distorted image doesn't prove it.

Graphs can also mislead when the image encourages readers to misjudge values. The two charts in [figure 15.12](#) represent exactly the same data but seem to communicate different messages:

Figure 15.12. Representation of suburban counties in state university undergraduates (percent of total)

The charts in [figure 15.12](#) are both stacked area charts. Despite their visual differences, they represent the same data. Area charts such as these represent changes in values not by the *angles* of the lines, but by the areas *between* them. In both charts, the bands for south, east, and west are roughly the same width throughout, indicating little change in the values they represent. The band for the north, however, widens sharply, representing a sharp increase in the numbers it represents. In the chart on the left, readers could easily

misjudge the top three bands, because they are on top of the rising north band, making those bands seem to rise as well. In the chart on the right, on the other hand, those three bands do not rise because they are on the bottom. Now only the band for the north rises.

Here are four guidelines for avoiding visual misrepresentation:

- Do not manipulate a scale to magnify or reduce a contrast.

- Do not use a figure whose image distorts values.

- Do not make a table or figure unnecessarily complex or misleadingly simple.

- If the table or figure supports a point, state it.

16 Introductions and Conclusions

A good introduction encourages readers to read your work with interest and prepares them to understand it better. A good conclusion leaves them with a clear statement of your point and renewed appreciation of its significance. In this chapter, we show you how to write both. The time you spend revising your introduction and conclusion may be the most important revision you do.

Once you think you have a draft that works, you're ready to write your final introduction and conclusion. Some writers think that means following the standard advice: *Grab their attention with something snappy or cute*. That's not useless advice, but readers want more than cute and snappy. In [part II](#), we showed you how to develop a project around a research problem. Here, we show you how to use that problem to engage your readers. What seizes their attention is a problem they think needs a solution, and what holds it is a promise that you've found it. As we've said, you can always work with readers who say, *I don't agree*. What you can't survive are those who shrug and say, *I don't care*.

16.1 THE COMMON STRUCTURE OF INTRODUCTIONS

As we've emphasized, different research communities do things in different ways, but nowhere do those differences seem greater than in their introductions. These three condensed examples are from the fields of cultural criticism, computer design, and legal history. But while they look different on the surface, their underlying structures are identical.

Why can't a machine be more like a man? In almost every episode of *Star Trek: The Next Generation*, the android Data wonders what makes a person a person. In the original *Star Trek*, similar questions were raised by the half-Vulcan Mr. Spock, whose status as a person was undermined by his machinelike logic and lack of emotion. In fact, Data and Spock are only the most recent "quasi-persons" who have explored the nature of humanity. The same question has been raised by and about creatures ranging from Frankenstein's monster to the Terminator. But the real question is why these characters who struggle to be persons are always white and male. As cultural interpreters, do they tacitly reinforce destructive stereotypes of what it means to be "normal"? The model person seems in fact to be defined by Western criteria that exclude most of the people in the world.

As part of its program of Continuous Quality Improvement (CQI),

Motodyne Computers plans to redesign the user interface for its Unidyne™ online help system. The specifications for its interface call for self-explanatory icons that let users identify their function without verbal labels. Motodyne has three years' experience with its current icon set, but it has no data showing which icons are self-explanatory. Lacking such data, we cannot determine which icons to redesign. This report provides data for eleven icons, showing that five of them are not self-explanatory.

In today's society, would Major John André, a British spy in civilian clothes captured behind American lines in 1780, be hanged? Though considered a noble patriot, he suffered the punishment mandated by military law. Over time our traditions have changed, but the punishment for spying has not. It is the only offense that mandates death. Recently, however, the Supreme Court has rejected mandatory death sentences in civilian cases, creating an ambiguity in their application to military cases. If Supreme Court decisions apply to the military, will Congress have to revise the Uniform Code of Military Justice? This article concludes that it will.

The topics and problems posed in those three introductions differ as much as their intended readers, but behind them is a shared pattern that readers look for in all introductions, regardless of field. That common structure consists of three elements:

Contextualizing background statement of the problem response to the problem

Not every introduction has all three elements, but most do.

Here is that pattern of *Context* + *Problem* + *Response* in each of those introductions:

CONTEXT: Why can't a machine be more like a man? . . . The same question has been raised by and about creatures ranging from Frankenstein's monster to the Terminator.

PROBLEM: But the real question is . . . do they tacitly reinforce destructive stereotypes of what it means to be "normal"?

RESPONSE: The model person seems in fact to be defined by Western criteria that exclude most of the people in the world.

CONTEXT: As part of its program of Continuous Quality Improvement (CQI), Motodyne Computers plans to redesign the user interface. . . .
Motodyne has three years' experience with its current icon set . . .

PROBLEM: but it has no data showing which icons are self-explanatory.

Lacking such data, we cannot determine which icons to redesign.

RESPONSE: This report provides data for eleven icons, showing that five of them are not self-explanatory.

CONTEXT: In today's society, would Major John André . . . be hanged [for spying]? . . . It is the only offense that mandates death.

PROBLEM: Recently, however, the Supreme Court has rejected mandatory death sentences in civilian cases, creating an ambiguity in their application to military cases. . . . Will Congress have to revise the Uniform Code of Military Justice?

RESPONSE: This article concludes that it will.

Each of those elements plays its own role not only in motivating readers to read your paper, but in helping them understand it.

16.2 STEP 1: ESTABLISHING A CONTEXT

The opening context establishes *common ground*, a shared understanding between reader and writer about the larger issue the writer will address. But it does more, illustrated by the opening of a fairy tale:

Like the opening to most fairy tales, this one establishes an unproblematic, even happy context, just so that it can be disrupted with a problem:

The rest of the story elaborates that problem and then resolves it.

Unlikely though it may seem, most introductions follow the same strategy. They open with the stable context of a common ground—some apparently unproblematic account of research already known. The writer then disrupts it with a problem, saying in effect: *Reader, you may think you know something, **but** your knowledge is flawed or incomplete.*

STABLE CONTEXT: In today's society, would Major John André, a British spy . . . be hanged? . . . [Spying] is the only offense that mandates death.

DISRUPTING PROBLEM: Recently, **however**, the Supreme Court has rejected mandatory death sentences. . . .

Not every research paper opens with common ground. This one opens directly with a problem:

Recently the chemical processes that thin the ozone layer have been found to be less well understood than once thought. We may have labeled hydrofluorocarbons as the chief cause incorrectly.

Some readers might find that problem disturbing enough to motivate their reading, but we can heighten its punch by introducing it with the seemingly unproblematic context of prior research, *specifically so that we can disrupt it*:

As we have investigated environmental threats, our understanding of chemical processes in acid rain and the buildup of carbon dioxide has improved, allowing us to understand better their effects on the biosphere.*.stable context* [Sounds good.] **But recently the processes that thin the ozone layer have been found to be less well understood than once thought.***.destabilizing condition* We may have labeled hydrofluorocarbons as the chief cause incorrectly.*.consequence*

Readers now have not one reason to see their self-interest in the problem, but two: not just the problem itself, but also their incomplete understanding of the whole matter.

Your context can describe a misunderstanding:

The Crusades are widely believed to have been motivated by religious zeal to restore the Holy Land to Christendom.*.stable context* In fact, the motives were at least partly, if not largely, political.

It can survey flawed research:

Few sociological concepts have fallen out of favor as fast as Catholicism's alleged protective influence against suicide. Once one of sociology's basic beliefs, it has been called into question by a series of studies in both Europe and North America. . . .*.stable context* However, certain studies still find an effect of religion . . .

Or it can point to a misunderstanding about the problem itself:

American education has focused on teaching children to think critically, to ask questions and test answers.*.stable context* But the field of critical thinking has been taken over by fads and special interests.

Some inexperienced researchers skimp on common ground, opening their paper as if they were picking up a class conversation where it left off. Their introductions are so sketchy that only others in the course would understand them:

In view of Hofstadter's failure to respect the differences among math, music, and art, it is not surprising that the response to *The Embodied Mind* would be stormy. It is less clear what caused the controversy. I will argue that any account of the human mind must be interdisciplinary. . . .

When you draft your introduction, imagine you are writing to someone who has read some of the same sources as you and is generally interested in the same issues, but does not know what specifically happened in your class.

Others make the opposite mistake, thinking they should list every source they read that remotely touches their topic. Survey only those sources whose findings you will *directly* modify. Add more *only* if you need to locate the problem in a wider context.

16.3 STEP 2: STATING YOUR PROBLEM

Once you establish a stable context or common ground, disrupt it with a problem. As we've said, the statement of a research problem has two parts (see [chapter 4](#)):

a *condition* of incomplete knowledge or understanding, and
the *consequences* of that condition, a more significant gap in understanding

You can state the condition directly:

. . . but Motodyne has no data showing which icons are self-explanatory.

Or you can imply it in an indirect question:

The real question is why these characters are always white and male.

You make this condition of ignorance or flawed understanding part of a *full* research problem *only* when you imagine someone asking, *So what?*, and then spell out as an

answer the *consequence* of that flawed understanding. You can state that consequence as a direct cost:

Lacking such data, we cannot determine which icons to redesign.*.cost*

Or you can transform the cost into a benefit:

With such data, we could determine which icons to redesign.*.benefit*

The choice between stating a cost and stating a benefit is not just a matter of style. Some research indicates that readers are more motivated by a real cost than by a potential benefit. Our suggestion: state costs or consequences when presenting your problem; state benefits to intensify your solution. That's the straightforward version of stating a problem; there are variations.

16.3.1 When Should You State the Condition of a Problem Explicitly? Occasionally, you tackle a problem so familiar that its name implies both its condition and consequence to those in the field: *the role of DNA in personality*; *Shakespeare's knowledge of foreign languages*. Likewise, in some fields like mathematics and the natural sciences, many research problems are widely known, so just stating the condition is enough to bring to mind its consequence. Here again is that (condensed) introduction to Crick and Watson's landmark account of the double-helix structure of DNA:

We wish to suggest a structure for the salt of deoxyribose nucleic acid (D.N.A.). This structure has novel features which are of considerable biological interest. A structure for nucleic acid has already been proposed by Pauling and Corey. They kindly made their manuscript available to us in advance of publication. Their model consists of three intertwined chains, with the phosphates near the fibre axis, and the bases on the outside. In our opinion, this structure is unsatisfactory. . . .

It was enough for them merely to "suggest" a structure for DNA, because they knew everyone wanted to know what it was. (Note, though, that they do raise a problem by mentioning Pauling and Corey's *incorrect* model.)

In the natural sciences and most social sciences, researchers usually address questions familiar to their readers. In that case, you might think you do not need to spell out your problem. But readers won't know the *particular* flaw in their knowledge that your research will correct unless you tell them.

In the humanities and some social sciences, researchers more often pose questions that they alone have found or even invented, questions that readers find new and often surprising. In that case, you must explicitly describe the gap in knowledge or flawed understanding that you intend to resolve.

16.3.2 Should You Spell Out Consequences and Benefits?

To convince readers that they should take your problem seriously, you must state the cost *they* will pay if it is not resolved or the benefits *they* gain if it is. Sometimes you can describe tangible costs that your research helps your readers avoid (see 4.1):

Last year the River City Supervisors agreed that River City should add the Bayside development to its tax base. Their plan, however, was based on little economic analysis. If the Board votes to annex Bayside without understanding what it will cost the city, **the Board risks worsening River City's already shaky fiscal situation.** When the burden of bringing sewer

and water service up to city code are included in the analysis, the annexation will cost more than the Board assumes.

This is the kind of problem that motivates *applied* research. The area of ignorance (no economic analysis) has tangible consequences (higher costs).

In pure research, you formulate the same kind of problem when you explain the consequence not in money, but as misunderstanding or, alternatively, as the possible benefit of better understanding:

Since 1972 American cities have annexed upscale neighborhoods to prop up tax bases, often bringing disappointing economic benefits. But those results could have been predicted had they done basic economic analysis. The annexation movement is a case study of how political decisions at the local level fail to use expert information. What is puzzling is why cities do not seek out that expertise. **If we can discover why cities fail to rely on basic economic analyses, we might better**

understand why their decision making fails so often in other areas as well.

This paper analyzes the decision-making process of three cities that annexed surrounding areas without consideration of economic consequences.

16.3.3 Testing Conditions and Consequences

In [chapter 4](#) we suggested a way to test how clearly you articulate the consequences of not solving a problem: after the sentences that best state your readers' condition of ignorance or misunderstanding, ask, *So what?*

Motodyne has no data showing which icons are self-explanatory. [*So what?*] Without such data, it cannot determine which icons to redesign.

Stories about the Alamo in Mexican and U.S. versions differ in obvious ways, but U.S. versions from different eras also differ. [*So what?*] Well . . .

Answering *So what?* can be exasperating, even dismaying. If you fall in love with stories about the Battle of the Alamo, you can pursue them to your heart's content, without having to answer to anyone but yourself: *I just like reading about them*. But for others to appreciate your research, you have to "sell" them on its significance. Otherwise, why should they spend time on it? To convince readers to care about your work, you have to show them that your problem is their problem—even if they don't know it yet. You have to convince them that if they go on not knowing, say, how Hollywood turned the Alamo story into myth, they will fail to understand something more important about national identity. To be sure, some readers will ask again, *So what? I don't care about national identity*. To which you can only shrug and think, *Wrong audience*. Successful researchers know how to find and solve interesting problems, but they also know how to find (or create) an audience interested in the problems they solve.

If you are sure your readers know the consequences of your problem, you might decide not to state them explicitly. Crick and Watson did not specify the cost of not knowing the structure of DNA, because they knew their readers already recognized that without understanding the structure of DNA, they could not understand genetics (something more important). Had Crick and Watson spelled out that consequence, it might have seemed redundant or condescending.

If you are tackling your first research project, no reasonable teacher will expect you to state the consequences of your problem in detail, because you probably don't yet know why other researchers think it is significant. But you take a big step in that direction when you can state your own incomplete knowledge or flawed understanding in a way that shows you are committed to improving it. You take an even bigger step when you can show that by better understanding one thing, you better understand something much more important, even if only to you.

16.4 STEP 3: STATING YOUR RESPONSE

Once you disrupt your readers' stable context with a problem, they expect you to resolve it in one of two ways: by stating your solution or main point or by promising that you will do so later on. Readers look for this statement or promise in the last few sentences of your introduction.

16.4.1 State the Gist of Your Solution

You can state your main point/solution explicitly toward the end of your introduction:

16.4.2 Promise a Solution

Alternatively, you can delay your main point by stating toward the end of your introduction only where your paper is headed, implying that you will present that point in your conclusion. This approach provides a launching point and creates a point-last paper:

As we have investigated environmental threats, our understanding . . . has improved. . . . But recently the chemical processes . . . have been found to be less well understood. . . . [So *what?*] We may have labeled hydrofluorocarbons as the chief cause incorrectly. [Well, *what have you found?*] **In this report we describe a hitherto unexpected chemical bonding between . . .***promise of point to come*

This introduction launches us into the paper, not with its main point but with a promise of one to come.

The weakest promise is one that merely announces a vague topic
This study investigates processes leading to ozone depletion.

When you save your point for the end of your paper, you ask your readers to trust that getting to it is worth their effort. You build this trust in your introduction by giving them not just a general topic but an outline of your solution or a plan for your argument (or both).

There are many designs for hydroelectric turbine intakes and diversion screens, but on-site evaluation is not cost-effective. A more viable alternative is computer modeling. **To evaluate hydroelectric diversion screens, this study will evaluate three computer models—Quattro, AVOC, and Turbo-plex—to determine which is most cost-effective in reliability, speed, and ease of use.**

This kind of plan is common in social sciences, but less frequent in the humanities, where many consider it a bit heavy-handed.

16.5 SETTING THE RIGHT PACE

When crafting your introduction, you must decide how quickly to raise your problem. That depends on how much your readers know. In this next example, the writer devotes one sentence to announcing a consensus among well-informed engineers and then briskly disrupts it:

Fluid-film forces in squeeze-film dampers (SFDs) are usually obtained from the Reynolds equation of classical lubrication theory. **However, the increasing size of rotating machinery requires the inclusion of fluid inertia effects in the design of SFDs. Without them . . .**

(We have no idea what any of that means, but the structure of *Context + Problem* is clear.)

This next writer also addresses technical concepts but patiently lays them out for readers who have little technical knowledge:

A method of protecting migrating fish at hydroelectric power developments is diversion by screening turbine intakes . . . [*another 110 words explaining screens*]. Since the efficiency of screens is determined by the interaction of fish behavior and hydraulic flow, screen design can be evaluated by determining its hydraulic performance . . . [*40 more words explaining hydraulics*]. **This study provides a better understanding of the hydraulic features of this technique, which may guide future designs.**

The pace of an introduction varies by field. Researchers whose problems are already familiar to their research communities can open quickly; those who work in fields where problems are not widely shared must start more slowly. But the pace of your introduction signals something else as well. When you open quickly, you imply an audience of peers; when you open slowly, you imply readers who know less than you. If your readers are knowledgeable and you open slowly, they may think *you* know too little. But if they know little and you open quickly, they may think you are inconsiderate of their needs.

16.6 ORGANIZING THE WHOLE INTRODUCTION

When organizing your introduction, you have many choices, but they are not as complicated as they might seem. They all follow what is in fact a simple “grammar.” A full introduction consists of just three elements:

Context + Problem + Response

You don’t need all three in every introduction:

If the problem is well known, omit the common ground.

If the consequences of the problem are well known, omit them.

If you want readers to follow your thinking before they know your answer, offer a launching point at the end of your introduction and state your main point in your conclusion.

All this may seem formulaic, but it’s what readers expect. And when you master a rhetorical pattern like this, you have more than a formula for writing. You also have a tool for thinking. To write a full statement of your shared context and problem, you have to think hard about what your readers know, what they don’t, and, in particular, what they should know and why.

16.7 FINDING YOUR FIRST FEW WORDS

Many writers find the first sentence or two especially difficult to write, and so they fall into clichés.

Don’t repeat the language of your assignment. If you are struggling to start, prime your pump by paraphrasing it, but when you revise, rewrite it.

Don’t start with a dictionary entry: “*Webster’s* defines *ethics* as . . .” If a word is important enough to define, a dictionary definition won’t serve.

Don’t start grandly: “The most profound philosophers have for centuries wrestled with the important question of . . .” If your subject is grand, it will speak its own importance.

These miscues arise from a good impulse: they are attempts to establish a shared context or common ground with a community of readers. The problem in all cases is that it is the

wrong community. In that first example, the community is too narrow: it is just the student's teacher. In the other examples, the community is too broad: those writers are groping for a context that all of humanity could agree to. To avoid these missteps, open in a way that is likely to appeal to the *specific community of readers* you hope to interest. Here are three standard choices for your first sentence or two.

16.7.1 Open with a Striking Fact Relevant to Your Problem

Those who think that tax cuts for the rich stimulate the economy should contemplate the fact that the top 1 percent of Americans control one-third of America's total wealth.

16.7.2 Open with a Striking Quotation

Do this only if its words anticipate key terms in the rest of your introduction:

"From the sheer sensuous beauty of a genuine Jan van Eyck there emanates a **strange fascination** not unlike that which we experience when permitting ourselves to be **hypnotized** by **precious stones**." Edwin Panofsky suggests here something **strangely magical** in Jan van Eyck's works. His images hold a **jewel-like** fascination. . . .

16.7.3 Open with a Relevant Anecdote

Do this only if its language anticipates your topic and vividly illustrates your problem. Here are the opening sentences of an article recounting the rise and fall of a Chicago street gang:

On a park bench in July 1996, Cynthia, Laurie, and other senior officers of the Black Sisters United (BSU)—Chicago's largest federation of "girl gangs"—reflected on their efforts to sustain an organization that could represent and act on behalf of young African-American women in the city. "We was so close!" Cynthia said with deep anguish, sitting upright and looking about to see if anyone had heard her.

16.8 WRITING YOUR CONCLUSION

Even if your argument doesn't have a section labeled *Conclusion*, it will have a paragraph or two that serve as one. Your conclusion is an occasion to sum up your argument, but just as important, it is an opportunity to extend your research community's conversation by

suggesting new questions your research has allowed you to see. You may be happy to know that you can write your conclusion using the same elements in your introduction, in reverse order.

16.8.1 Start with Your Main Point

State your main point near the beginning of your conclusion. If you already stated it in your introduction, repeat it here but more fully; do not simply repeat it word-for-word.

16.8.2 Add a New Significance or Application

After your point, say why it's significant, preferably with a new answer to *So what?* For example, the writer of this conclusion introduces an additional consequence of the Supreme Court's decision on military death sentences:

In light of recent Supreme Court decisions rejecting mandatory capital punishment, the mandatory death penalty for treason is apparently unconstitutional and must therefore be revised by Congress. **More significantly, though, if the Uniform Code of Military Justice is changed, it will challenge the fundamental value of military culture that ultimate betrayal requires the ultimate penalty. Congress will then have to deal with the military's sense of what is just.**

This observation belongs in the conclusion rather than in the introduction because it suggests *further questions* the article doesn't take up: *How exactly will the military respond to that challenge to its values? How should Congress respond in turn?* Just as in your introduction you increase the punch of your problem by stating its consequences, so in your conclusion you can increase the significance of your solution by noting its additional implications.

16.8.3 Call for More Research

Just as your opening context surveys research already done, so your conclusion can call for research still to do:

These differences between novice and expert diagnosticians define their maturation and development. But while we know how novices and experts think differently, **we do not understand which elements in the social experience of novices contribute to that development and how. We need longitudinal studies on how**

mentoring and coaching affect outcomes and whether active explanation and critique help novices become skilled diagnosticians more quickly.

When you state what remains to do, you keep the conversation alive. So before you write your last words, imagine someone fascinated by your work who wants to follow up on it: What more would *you* like to know? What research would you suggest they do? After all, that may have been how you found your own problem.

Quick Tip: Titles

The first thing readers read—and the last thing you should write—is your title. Beginning writers just attach a few words to suggest the topics of their papers. That's a mistake: a title is useful when it helps readers understand *specifically* what is to come. Compare these three titles:

Microfinance

Microfinance and Economic Development

Microfinance as a Strategy for Economic Development: Realizing Its Potential for Improving the Standing of Women

Put into your title the keywords in your main point, the ones you circled when you checked for the continuity of conceptual themes (6.6.1, 8.2.1,

12.1.1, 12.3.2, 13.4). When readers see those concepts turn up again in your main point and again through the body of your paper, they will feel that your text has met their expectations. (Two-line titles give you more room for key terms. End the first line with a colon that introduces a more specific second line.)

17 Revising Style

Telling Your Story Clearly

So far we have focused on the argument and organization of your paper. In this chapter, we show you how to revise your sentences so that readers will think they are clear and direct.

Readers will accept your claim only if they understand your argument, but they won't understand your argument if they can't understand your sentences. Once you revise your paper so that readers will judge its argument to be sound and well organized, find time to make a last pass to make your sentences as easy to read as the complexity of your ideas allows. But again, you face a familiar problem: you can't know which sentences need revising just by reading them. Since you already know what you want them to mean, you will read into them what you want your readers to get out of them. To ensure that your sentences will be as clear to your readers as they are to you, you need a way to identify difficult sentences even when they seem fine to you.

17.1 JUDGING STYLE

If you had to read an article in the style of one of the following examples, which would you choose?

1a. Conventional management practice assumes that interaction and collaboration enhance organizational performance by improving employee creativity and productivity. But unless collaboration is punctuated by isolation, and unless workspace configurations provide isolation opportunities, erosion rather than enhancement of organizational effectiveness may result.

1b. Managers want the people who work for them to interact and collaborate. When they do this, they become more creative and productive. The organization then performs better. But people also need opportunities to work alone, and workplaces need to provide these opportunities. Otherwise, the organization may become less effective.

1c. Managers conventionally assume that when employees interact and collaborate, they become more creative and productive, thus leading the whole organization to perform better. But unless employees also have opportunities to work alone, and

unless workspaces are configured to provide them, the organization may become less rather than more effective.

Few readers choose (1a): it sounds dense, abstract, opaque. Some choose (1b), but it sounds simpleminded, like an adult speaking slowly to a child. Most choose (1c), which sounds like one colleague speaking to another. One of the worst problems in academic writing today is that too many researchers sound like (1a).

A few researchers prefer (1a), claiming that heavy thinking demands heavy writing, that when they try to make complicated ideas clear, they sacrifice nuances and complexity of thought for too-easy understanding. If readers don't understand, too bad; they should work harder.

Perhaps. Everyone who reads philosophers like Immanuel Kant or Friedrich Hegel struggles with their complex prose style, at least at first. But what they have to say proves to be worth the effort. The problem is, few of us think as well as Kant or Hegel. For most of us most of the time, our dense writing indicates not the irreducible difficulty of a work of genius, but the sloppy thinking of writers who aren't considering their readers. And even when complex thought does require a complex style (which is less often than we think), every sentence profits from a second look (and truth be told, Kant and Hegel would have benefited from a good editor).

Some writers do go too far in avoiding a complex style, using simplistic sentences like those in (1b) above. But we assume that most of you do not have that problem, and that you need little help with spelling and grammar. (If you think you do, talk to a writing tutor.) We address here the problem of a style that is too "academic," which is to say, more difficult than it has to be. Convolved and indirect prose is not what good writers aim for, but what thoughtless ones get away with.

This problem especially afflicts those just starting advanced work because they are hit by double trouble. First, when any of us writes about new and complex ideas that challenge our understanding, we write less clearly than we ordinarily can. This problem afflicts even the most experienced researchers. But new researchers compound that problem when they believe that a complex style bespeaks academic success and they imitate the tangled prose they read. That we can avoid.

17.2 THE FIRST TWO PRINCIPLES OF CLEAR WRITING

17.2.1 Distinguishing Impressions from Their Causes

If we asked you to explain how you chose between (1a) and (1c) above, you would probably describe (1a) with words like *unclear*, *wordy*, and *dense*; (1c) with words like *clear*, *concise*, and *direct*. But those words refer not to those sentences on the page, but to how you *felt* as you read them. If you said that (1a) was *dense*, you were really saying that *you* had a hard time getting through it; if you said (1c) was *clear*, you were saying that *you* found it easy to understand.

There's nothing wrong with using impressionistic words to describe your feelings, but they don't help you *fix* unclear sentences like (1a), because they don't explain *what it is on the page or screen that makes you feel as you do*. For that, you need a way to think about sentences that connects an impression like *confusing* to what it is *in the sentence* that confuses you. More important, you have to know how to revise your own sentences when they are clear to you but won't be to your readers.

There are a few principles that distinguish the felt complexity of (1a) from the mature clarity of (1c). These principles focus on only two parts of a sentence: the first six or seven words and the last four or five. Get those words straight, and the rest of the sentence will (usually) take care of itself. To use these principles, though, you must understand five grammatical terms: *simple subject*, *whole subject*, *verb*, *noun*, and *clause*. (If you haven't used those terms for a while, review them before you read on.)

This is important: don't try to apply these principles as you write new sentences. If you follow them *as you draft*, you may tie yourself in knots. Rather, let them guide you when you revise sentences you have already written.

17.2.2 Subjects and Characters

The first principle may remind you of something you learned in grammar school. At the heart of every sentence are its subject and verb. In grammar school you probably learned that subjects are the "doers" or agents of an action. But that's not always true, because subjects can be things other than doers, even actions. Compare these two sentences (the whole subject in each clause is underlined):

2a. Locke frequently repeated himself because he did not trust the power of words to name things accurately.

2b. The reason for Locke's frequent repetition lies in his distrust of the accuracy of the naming power of words.

The two subjects in (2a)—*Locke* and *he*—fit that grammar-school definition: they are doers. But the subject of (2b)—*The reason for Locke's frequent repetition*—does not, because *reason* doesn't really *do* anything here. The real doer is still Locke.

To get beyond sixth-grade definitions, we have to think not only about the grammar of a sentence—its subjects and verbs—but also about the *stories* they tell—about doers and their actions. Here is a story about rain forests and the biosphere:

3a. If rain forests are stripped to serve short-term economic interests, the earth's biosphere may be damaged.

3b. The stripping of rain forests in the service of short-term economic interests could result in damage to the earth's biosphere.

In the clearer version, (3a), look at the whole subjects of each clause:

3a. If rain forests_{subject} are stripped_{verb} . . . the earth's biosphere_{subject} may be damaged_{verb}.

Those subjects name the main characters in that story in a few short, concrete words: *rain forests* and *the earth's biosphere*. Compare (3b):

3b. The stripping of rain forests in the service of short-term economic interests_{subject} could result_{verb} in damage to the earth's biosphere.

In (3b) the simple subject (*stripping*) names not a concrete character but rather an action; it is only part of the long abstract phrase that is the whole subject: *the **stripping** of rain forests in the service of short-term economic interests*.

Now we can see why grammar-school definitions may be bad language theory but good advice about writing. The first principle of clear writing is this:

Readers will judge your sentences to be clear and readable to the degree that you make their subjects name the main characters in your story. When you do this, your subjects will be short, specific, and concrete.

17.2.3 Verbs, Nouns, and Actions

There is a second difference between clear and unclear prose: it is in the way writers express the crucial *actions* in their stories—as verbs or as nouns. For example, look again at the pairs of sentences (2) and (3) below. (Words naming actions are boldfaced; actions that are verbs are underlined; actions that are nouns are double-underlined.)

2a. Locke frequently **repeated** himself because he did not **trust** the power of words to **name** things accurately.

2b. The reason for Locke's frequent **repetition** lies in his **distrust** of the accuracy of the **naming** power of words.

3a. If rain forests are **stripped** to **serve** short-term economic interests, the earth's biosphere may be **damaged**.

3b. The **stripping** of rain forests in the **service** of short-term economic interests could result in **damage** to the earth's biosphere.

Sentences (2a) and (3a) are clearer than (2b) and (3b) because their subjects are characters, but also because their actions are expressed not as nouns but as verbs.

There is a technical term for turning a verb (or adjective) into a noun: we *nominalize* it. (This term defines itself: when we nominalize the verb *nominalize*, we create the nominalization *nominalization*.) Most nominalizations end with suffixes such as *-tion*, *-ness*, *-ment*, *-ence*, *-ity*.

Verb → Nominalization Adjective → Nominalization

But some are spelled like the verb: *change* → *change*; *delay* → *delay*; *report* → *report*.

(We'll discuss passive verbs like *are stripped* and *be damaged* in 17.4.) When you express actions not with verbs but with abstract nouns, you also

clutter a sentence with articles and prepositions. Look at all the articles and prepositions (boldfaced) in (4b) that (4a) doesn't need:

4a. Having standardized indices for measuring mood disorders, we now can quantify patients' responses to different treatments.

4b. The standardization **of** indices **for the** measurement **of** mood disorders has now made possible **the** quantification **of** patient response **as a** function **of** treatment differences.

Sentence (4b) adds one *a*, *as*, and *for*; two *thes*, and four *ofs*, all because four verbs were turned into nouns: *standardize* → *standardization*, *measure* → *measurement*, *quantify* → *quantification*, *respond* → *response*.

When you turn adjectives and verbs into nouns, you can tangle up your sentences in two more ways:

You have to add verbs that are less specific than the verbs you could have used. In (4b), instead of the specific verbs *standardize*, *measure*, *quantify*, and *respond*, we have the single vague verb *made*.

You are likely to make the characters in your story modifiers of nouns or objects of prepositions or to drop them from a sentence altogether: in (4b), the character *we* becomes *our*, and thereafter the rest of the characters are missing in action.

So here are two principles of a clear style:

- Express crucial actions in verbs.

Make your central characters the subjects of those verbs; keep those subjects short, concrete, and specific.

17.2.4 Diagnosis and Revision

Given how readers judge sentences, we can offer ways to diagnose and revise yours.

To diagnose:

Underline the first six or seven words of every clause, whether main or subordinate.

Perform two tests:

Are the underlined subjects concrete characters, not abstractions?

Do the underlined verbs name specific actions, not general ones like *have*, *make*, *do*, *be*, and so on?

If the sentence fails either test, you should probably revise.

To revise:

Find the characters you want to tell a story about. If you can't, invent them.

Find what those characters are doing. If their actions are in nouns, change them into verbs.

Create clauses with your main characters as subjects and their actions as verbs.

You will probably have to recast your sentence in some version of *If X, then Y*; *X, because Y*; *Although X, Y*; *When X, then Y*; and so on.

That's the simple version of revising dense prose into something clearer.

Here is a more nuanced one.

17.2.5 Who or What Can Be a Character?

You may have wondered why we called *rain forests* and *the earth's biosphere* "characters" when we usually think of characters as flesh-and-blood people. For our purposes, a character is anything that can be the subject of a lot of verbs in a sequence of sentences. This means that we can also tell stories whose characters are things like *rain forests* and even abstractions like *thought disorders*. In your kind of research, you may have to tell a story about *demographic changes*, *social mobility*, *isotherms*, or *gene pools*. Sometimes you have a choice: a paper in economics might tell a story about real or virtual people,

such as *consumers* and the *Federal Reserve Board*, or about abstractions associated with them, such as *savings* and *monetary policy*. Note, however, that you can still make those abstract characters part of a story with action verbs:

5a. When consumers **save** more, the Federal Reserve **changes** its monetary policy to influence how banks **lend** money.

5b. When consumer savings **rise**, Federal Reserve monetary policy **adapts** to **influence** bank **lending** practices.

A passage might be about real people or about abstractions associated with them: *banks* vs. *lending practices*, *savers* vs. *microeconomics*, or *analysts* vs. *predictions*. All things being equal, though, readers prefer characters to be at least concrete things or, better, flesh-and-blood people.

Experts, however, like to tell stories about abstractions (boldfaced; subjects are underlined).

Standardized indices to measure **mood disorders** help us quantify how patients respond to different **treatments**. These measurements suggest that treatments requiring long-term **hospitalization** are no more effective than outpatient **care** for most patients.

The abstract nominalizations in the second sentence—*measurements*, *treatments*, *hospitalization*, *care*—refer to concepts as familiar to its intended readers as *doctors* and *patients*. Given those readers, the writer would not need to revise them.

In a way, that example undercuts our advice about avoiding nouns made out of verbs, because now instead of revising every abstract noun into a verb, you have to choose which ones to change and which ones to leave as nouns. For example, the abstract nouns in the second sentence of (6) are the same as the first three in (7a):

7a. The **hospitalization** of patients without appropriate **treatment** results in the unreliable **measurement** of outcomes.

But we would improve that sentence if we revised those abstract nouns into verbs:

7b. We cannot **measure** outcomes reliably when patients **are hospitalized** but not **treated** appropriately.

So what we offer here is no iron rule of writing, but rather a principle of diagnosis and revision that you must apply judiciously. In general, though, readers prefer sentences whose subjects are short, specific, and concrete. And that usually means flesh-and-blood characters.

17.2.6 Avoiding Excessive Abstraction

You create the worst problems for readers when you make abstract nouns your main character and subjects of your sentences, then sprinkle more abstractions around them. Here is a passage about two abstract characters, *democracy* and *institutionalization*. Nevertheless, the passage is still clear, at least for its intended readers, because its writers focused on their characters in subjects and avoided additional abstractions, especially nominalizations (main characters are italicized; whole subjects are underlined; verbs are boldfaced):

8a. We **expect** that older *democracies* **will benefit** from greater *institutionalization* in the political sphere. Although political *institutionalization* **is** difficult to define, there **seems** to be general consensus that **procedures** in a well-institutionalized polity **are** functionally **differentiated**, **regularized** (and hence predictable), **professionalized** (including meritocratic methods of recruitment and promotion), **rationalized** (explicable, rule based, and non-arbitrary), and **infused** with value. Most long-standing *democracies* **fit** this description.

Note how the story becomes less clear when those main characters are displaced from subjects and when the key abstraction *institutionalization* is surrounded by other abstract nouns (main characters are italicized; whole subjects are underlined; the additional abstractions are boldfaced):

8b. Our **expectation** is that greater *institutionalization* in the political sphere will be of **benefit** to older *democracies*. Although **definition** of political *institutionalization* is difficult, there seems to be general consensus that

functional differentiation, regularization (and hence predictable), professionalization (including meritocratic methods of recruitment and promotion), rationalization (explicable, rule based, and nonarbitrary), and the infusion of value are characteristic of procedures in a well-institutionalized polity. This description is a fit for most long-standing *democracies*.

We're not suggesting that you change every abstract noun into a verb. This story about democracy and institutionalization would be difficult to transpose into one about a flesh-and-blood character like *citizens* or *you*. (If you don't believe us, give it a try.) If your best main characters are abstractions, use them. But avoid other abstractions you don't need. As always, the trick is knowing which ones you need and which you don't (usually fewer than you think). Knowing one from the other is a skill that comes only from practice— and criticism.

17.2.7 Creating Main Characters

Having qualified our principle once, we complicate it again. If your sentences are readable, your characters will be the subjects of verbs that express the crucial actions those characters are involved in. But most stories have several characters, any one of whom you can turn into a main character by making it the subject of sentences. Take the sentence about rain forests:

If rain forests are stripped to serve short-term economic interests, the earth's biosphere may be damaged.

That sentence tells a story that implies other characters but does not specify them: Who is stripping the forests? More important, does it matter? This story could focus on them, but who are they?

9a. If developers strip rain forests to serve short-term economic interests, they may damage the earth's biosphere.

9b. If loggers strip rain forests to serve short-term economic interests, they may damage the earth's biosphere.

9c. If Brazil strips its rain forests to serve short-term economic interests, it may damage the earth's biosphere.

Which is best? It depends on whom you want *your readers to think* the story is about. As you revise sentences, put characters in subjects and actions in verbs, when you can. But be sure that the character is your *central* character, if only for that sentence.

17.3 A THIRD PRINCIPLE: OLD BEFORE NEW

There is a third principle of reading and revising even more important than the first two. Fortunately, all three principles are related. Compare the (a) and

versions in the following. Which seems clearer? Why? (Hint: Look at the beginnings of sentences, this time not just for characters as subjects, but whether those subjects express information that is familiar or information that is new and therefore unexpected.)

10a. Because the naming power of words was distrusted by Locke, he repeated himself often. Seventeenth-century theories of language, especially Wilkins's scheme for a universal language involving the creation of countless symbols for countless meanings, had centered on this naming power. A new era in the study of language that focused on the ambiguous relationship between sense and reference begins with Locke's distrust.

10b. Locke often repeated himself because he distrusted the naming power of words. This naming power had been central to seventeenth-century theories of language, especially Wilkins's scheme for a universal language involving the creation of countless symbols for countless meanings. Locke's distrust begins a new era in the study of language, one that focused on the ambiguous relationship between sense and reference.

Most readers prefer (10b), saying not just that (10a) is *too complex* or *inflated*, but that it's also *disjointed*; it doesn't *flow*—impressionistic words that again describe not what we see on the page but how we *feel* about it.

We can explain what causes those impressions if we again apply the “first six or seven words” test. In the disjointed (a) version, the sentences after the first one begin with information that a reader could not predict:

the naming power of words

Seventeenth-century theories of language

A new era in the study of language

In contrast, the sentences after the first one in (10b) begin with information that readers would find familiar:

Locke

This naming power [repeated from the previous sentence]

Locke's distrust [a useful abstract noun because it repeats something from the previous sentence]

In (10a) each sentence begins unpredictably, so we can't easily see the "topic" of the whole passage. In (10b) each sentence after the first opens with words referring to ideas that readers recall from the previous sentence.

Readers follow a story most easily if they can begin each sentence with a character or idea that is familiar to them, either because it was already mentioned or because it comes from the context. From this principle of reading, we can infer principles of diagnosis and revision.

To diagnose:

Underline the first six or seven words of every sentence.

Have you underlined words that your readers will find familiar and easy to understand (usually words used before)?

If not, revise.

To revise:

Make the first six or seven words refer to familiar information, usually something you have mentioned before (typically your main characters).

Put at the ends of sentences information that your readers will find unpredictable or complex and therefore harder to understand.

This old-new principle happily cooperates with the ones about characters and subjects, because older information usually names a character (after you introduce it, usually at the *end* of a prior sentence). But should you ever have to choose between beginning a

sentence with a character or with old information, *always choose the principle of old before new*.

17.4 CHOOSING BETWEEN THE ACTIVE AND PASSIVE VOICE

You may have noted that some of the clearer sentences had passive verbs. This seems to contradict familiar advice from English teachers to avoid them. Followed mindlessly, that advice will make your sentences *less* clear. Rather than worry about active and passive, ask a simpler question: Do your sentences begin with familiar information, preferably a main character? If you put familiar characters in your subjects, you will use the active and passive properly.

For example, which of these two passages “flows” more easily?

11a. The quality of our air and even the climate of the world depend on healthy rain forests in Asia, Africa, and South America. But the increasing demand for more land for agricultural use and for wood products for construction worldwide now threatens these forests with destruction.

11b. The quality of our air and even the climate of the world depend on healthy rain forests in Asia, Africa, and South America. But these rain forests are now threatened with destruction by the increasing demand for more land for agricultural use and for wood products used in construction worldwide.

Most readers think (11b) flows more easily. Why? Note that the beginning of the second sentence in (11b) picks up on the character introduced at the end of the first sentence:

11b. . . . rain forests in Asia, Africa, and South America. But these rain forests . . .

The second sentence of (11a), on the other hand, opens with information completely unconnected to the first sentence:

11a. . . . rain forests in Asia, Africa, and South America. But the increasing demand for more land . . .

In other words, the passive allowed us to move the older, more familiar information from the end of its sentence to its beginning, where it belongs.

And that's the main function of the passive: to build sentences that begin with older information. If we don't use the passive when we should, our sentences won't flow as well as they could.

In English classes, students are told that they should use only active verbs, but they hear the opposite in engineering, the natural sciences, and some social sciences. There teachers demand the passive, thinking that it makes writing more objective. Most of that advice is equally misleading. Compare the passive (12a) with the active (12b):

12a. Eye movements **were measured** at tenth-of-second intervals.

12b. We **measured** eye movements at tenth-of-second intervals.

These sentences offer equally objective information, but their *stories* differ: one is about eye movements, the other about a person measuring them, who happens also to be the author. The first is supposed to be more “objective” because it ignores the person and focuses on the movements. But just avoiding *I* or *we* doesn't make writing more “objective.” It simply changes the story.

In fact, the issue of the passive is still more complicated. When a scientist uses the passive to describe a *process*, she implies that the process can be repeated by anyone. In this case, the passive is the right choice, because anyone who wanted to repeat the research would have to measure eye movements.

On the other hand, consider this pair of sentences:

13a. It **can be concluded** that the fluctuations result from the Burnes effect.

13b. We **conclude** that the fluctuations result from the Burnes effect.

The active verb in (13b), *conclude*, and its first-person subject, *we*, are not only common in the sciences, but appropriate. The difference? It has to do with the kind of action the verb names. The active (and therefore first person) is appropriate when authors refer to actions that only the *writer/researcher* can perform—not only rhetorical actions, such as *suggest*, *conclude*, *argue*, or *show*, but also those for which they get credit as scientists, such as *design* experiments, *solve* problems, or *prove* results. Everyone can *measure*, but only author/researchers are entitled to *claim* what their research means. Scientists typically use the first person and active verbs at the beginning of journal articles, where they describe

how *they* discovered their problem and at the end where they describe how *they* solved it. In between, when they describe processes that anyone can perform, they regularly use the passive.

17.5 A FINAL PRINCIPLE: COMPLEXITY LAST

We have focused on how clauses begin. Now we look at how they end. You can anticipate the principle for ending sentences: if familiar information goes first, the newest, most complex information goes last. This principle is particularly important in three contexts:

when you introduce a new technical term

when you present a unit of information that is long and complex

when you introduce a concept that you intend to develop in what follows

17.5.1 Introducing Technical Terms

When you introduce technical terms that are new to your readers, construct your sentences so that those terms appear in the last few words. Compare these two:

14a. The monoamine hypothesis has been the leading biological account of depression for over three decades. According to this hypothesis, deficits in monoamines including dopamine, epinephrine, norepinephrine, and serotonin are associated with depression. Monoamine concentrations in neural synapses are regulated in different ways by different types of antidepressants.

14b. For over three decades, the leading biological account of depression has been the monoamine hypothesis. According to this hypothesis, depression is associated with deficits in neurotransmitters called monoamines, including dopamine, epinephrine, norepinephrine, and serotonin. Different types of antidepressants work in different ways to regulate concentrations of monoamines in neural synapses.

In (14a) all the technical-sounding terms appear early in the sentences; in (14b) the technical terms appear at the end of the sentences.

17.5.2 Introducing Complex Information

Put complex bundles of ideas that require long phrases or clauses at the end of a sentence, never at the beginning. Compare (11a) and (11b) again:

11a. The quality of our air and even the climate of the world depend on healthy rain forests in Asia, Africa, and South America. But the increasing demand for more land for agricultural use and for wood products for construction worldwide now threatens these forests with destruction.

11b. The quality of our air and even the climate of the world depend on healthy rain forests in Asia, Africa, and South America. But these rain forests are now threatened with destruction by the increasing demand for more land for agricultural use and for wood products used in construction worldwide.

In (11a) the second sentence begins with a long, complex unit of information, a subject that runs on for more than a line. In contrast, the subject of the second sentence in (11b), *these rain forests*, is short, simple, and easy to read, again because the passive verb (*are now threatened*) lets us flip the short and familiar information to the beginning and the long and complex part to the end.

In short, don't begin your sentences with complexity; save it for the end. Unfortunately that's not easy to do, because you may be so familiar with your ideas that you can't distinguish what is *for your readers* old and simple from what's new and complex.

17.5.3 Introducing What Follows

When you start a paragraph, put the key terms that appear in the rest of the paragraph at the end of the first or second sentence. Which of these two sentences would best introduce the rest of the paragraph that follows?

15a. The political situation changed, because disputes over succession to the throne plagued seven of the eight reigns of the Romanov line after Peter the Great.

15b. The political situation changed, because after Peter the Great seven of the eight reigns of the Romanov line were plagued by turmoil over disputed succession to the throne.

The problems began in 1722, when Peter the Great passed a law of succession that terminated the principle of heredity and required the sovereign to appoint a successor. But because many tsars, including Peter, died before they named successors, those who aspired to rule had no authority by appointment, and so their succession was often disputed by lower-level aristocrats. There was turmoil even when successors were appointed.

Most readers feel that (15b) is more closely connected to the rest of the passage. The last few words of (15a) seem unimportant in relation to what follows (in another context, of course, they might be crucial).

So once you've checked the first six or seven words in every sentence, check the last five or six as well. If those words are not the most important, complex, or weighty, revise so that they are. Look especially at the ends of sentences that introduce paragraphs or even sections.

17.6 SPIT AND POLISH

We've focused on those issues of sentence style relevant to writing research papers, and on principles of diagnosis and revision that help make prose as readable as possible. There are other principles—sentence length, the right choice of words, concision, and so on. But those are issues pertinent to writing of all kinds and are addressed by many books. And, of course, readability alone is not enough. After you revise your style, you still have to check your grammar, spelling, and punctuation. Then you have to make sure that you have observed the accepted conventions for representing numbers, proper names, foreign words, and so on. Though important, those matters fall outside the purview of this book.

Quick Tip: The Quickest Revision Strategy

Our advice about revision may seem overly detailed, but if you revise in steps, it's not difficult to follow. The first step is the most important: as you draft, remember to forget these steps (except for this one about remembering). Your first job is to draft something to revise. You will never do that if you keep asking yourself whether you should have just used a verb or a noun. If you don't have time to look at every sentence, start with

passages where you found it hard to explain your ideas. When you struggle to write about confusing content, your sentences tend toward confusion as well.

For Clarity and Flow

To diagnose:

Highlight the first six or seven words in every sentence. Ignore short introductory phrases such as *At first*, *For the most part*, and so on.

Run your eye down the page, checking whether you highlighted a consistent set of related words. The words that begin a series of sentences need not be identical, but they should name people or concepts that your readers will see are clearly related. If not, revise.

Check the highlighted words in each sentence. They should include a subject that names a character and a verb that names an important action. If not, revise.

To revise:

Identify your main characters, real or conceptual. Make them the subjects of verbs.

Look for nouns ending in *-tion*, *-ment*, *-ence*, and so on. If they are the subjects of verbs, turn them into verbs.

Make sure that each sentence begins with familiar information, preferably a character you have mentioned before.

For Emphasis

To diagnose:

Underline the last five or six words in every sentence.

You should have underlined

technical-sounding words that you are using for the first time

the newest, most complex information

information that is most emphatic

concepts that the next several sentences will develop

If you do not see that information there, revise: put those words last in the sentence.

PART V

Some Last Considerations

The Ethics of Research

In the last few hundred pages, we've offered a lot of practical advice, but also much preaching about creating social contracts with your readers, projecting an ethos that will encourage their trust, guarding against biases in collecting and reporting evidence, avoiding plagiarism, and so on. Now we want to share with you the underlying ethical issues that shape our advice, hoping that when you close this book, you'll give them more thought.

Everything we've said about research reflects our belief that it is a profoundly *social* activity that connects you both to those who will use your research and to those who might benefit—or suffer—from that use. But it also connects you and your readers to everyone whose research you used and beyond them to everyone whose research they used. To understand our responsibility to those in that network, now and in the future, we have to move beyond mere technique to think about the ethics of civil communication.

We start with two broad conceptions of the word *ethics*: the forging of bonds that create a community and the moral choices we face when we act in that community. The term *ethical* comes from the Greek *ethos*, meaning either a community's shared *customs* or an individual's *character*, good or bad. So far, we have focused on the community-building aspects of research, the bonds we create with our readers and our sources. But as does any social activity, research challenges us to define our individual ethical principles and then to make choices that honor or violate them.

At first glance, a purely academic researcher seems on relatively safe ethical ground—we are less tempted to sacrifice principle for gain than, say, a Wall Street analyst evaluating a stock that her firm wants her to push on investors, or a scientist paid by a drug company to “prove” that a product is safe (regardless of whether it works). No teacher will pay you to write a paper supporting her views, and you probably won't have occasion to fake results to gain fame—like the American researcher who became famous (and powerful) for discovering an HIV virus, when he had in fact “borrowed” it from a laboratory in France.

Even so, you will face such choices from the very beginning of your project. Some are the obvious *Thou shalt nots* for ethical researchers:

They do not plagiarize or claim credit for the results of others.

They do not misreport sources, invent data, or fake results.

They do not submit data whose accuracy they don't trust, unless they say so.

They do not conceal objections that they cannot rebut.

They do not caricature or distort opposing views.

They do not destroy data or conceal sources important for those who follow.

We apply these principles easily enough to obvious cases: the biologist who used india ink to fake "genetic" marks on his mice, the Enron accountants and their auditors at Arthur Andersen who shredded source documents, the government political advisers who erase e-mails, or the student who submits a paper purchased on the Internet.

More challenging are those occasions when ethical principles take us beyond a simple *Do not* to what we should affirmatively *Do*. When we think about ethical choices in that way, we move beyond simple conflicts between our own self-interest and the honest pursuit of truth, or between what we want for ourselves and what is good for or at least not harmful to others. If reporting research is genuinely a collaborative effort between readers and writers to find the best solution to shared problems, then the challenge is to find ways to create ethical partnerships to make ethical choices (what we traditionally call *character*) that can help build ethical communities.

Such a challenge raises more questions than we can answer here. Some of those questions have answers that we all agree on; others are controversial. The five of us answer some of them differently. But one thing we agree on is that research offers every researcher an ethical invitation that, when not just dutifully accepted but *embraced*, can serve the best interests of both researchers and their readers.

When you create, however briefly, a community of shared understanding and interest, you set a standard for your work higher than any you could set for yourself alone.

When you explain to others why your research *should* change their understanding and beliefs, you must examine not only your own understanding and interests, but your responsibility to them if you convince them to change theirs.

When you acknowledge your readers' alternative views, including their strongest objections and reservations, you move closer not just to more reliable knowledge, better understanding, and sounder beliefs, but to honoring the dignity and human needs of your readers.

In other words, when you do research and report it as a conversation among equals working toward greater knowledge and better understanding, the ethical demands you place on yourself should redound to the benefit of all—even when we cannot all agree on a common good. When you decline that conversation, you risk harming yourself and possibly those who depend on your work.

It is this concern for the integrity of the common work of a community that underscores why researchers condemn plagiarism so strongly. Plagiarism is theft, but of more than words. By not acknowledging a source, the plagiarist steals the modest recognition that honest researchers should receive, the respect that a researcher spends a lifetime struggling to earn. And that weakens the community as a whole, by reducing the value of research to those who follow.

That is true in all research communities, including the undergraduate classroom. The student plagiarist steals not only from his sources, but from his colleagues by making their work seem lesser by comparison to what was bought or stolen. When such intellectual thievery becomes common, the community grows suspicious, then distrustful, then cynical: *Everyone does it. I'll fall behind if I don't.* Teachers must then worry as much about not being tricked as about teaching and learning. What's worse, the plagiarist compromises her own education and so steals from the larger society that devotes its resources to training her and her generation to do reliable work later, work that the community will depend on.

In short, when you report your research ethically, you join a community in a search for some common good. When you respect sources, preserve and acknowledge data that run against your results, assert claims only as strongly as warranted, acknowledge the limits of your certainty, and meet all the other ethical obligations you have as a researcher and

writer, you move beyond gaining a grade or other material goods—you earn the larger benefit that comes from creating a bond with your readers. You discover that research focused on the best interests of others is also in your own.

A Postscript for Teachers

In this postscript we want to make explicit what has been implicit throughout. We hope you will join in an effort to improve the national “research scene.” Too many teachers of undergraduates say, *I’ve given up teaching the research paper*. Colleagues tell us that the ones they get are boring patchworks, that students aren’t up to the task, that in any event the dead-tree research paper is a relic of pre-digital days, and even that no one but ivory-tower academics does research anymore.

We think otherwise, of course. We think doing research is the best way to learn to read and think critically. And we know for a fact that the vast majority of our students will have careers in which, if they do not do their own research, they will have to evaluate and depend on the research of others. We also know that most of that research will be in written form, even if it happens to be delivered online. And we can think of no way to prepare for that responsibility better than doing research of one’s own.

We wrote this book for those who agree, and believe—or will at least consider—two propositions:

Students learn to do research well and report it clearly when they take the perspective of their readers and of the community whose values and practices define competent research and its reporting.

They learn to manage an important part of that mental and social process when they understand how a few key formal features of their reports influence how their readers read and judge them.

These two propositions, we believe, are closely related. By understanding the complementary processes of reading and writing, students plan, perform, and report their research better. They can use the features that readers expect to guide themselves through not only the process of drafting, but all the stages of their project. And by understanding what their readers look for in a report, they learn to read the reports of others more critically. The two processes, reading and writing, are mutually supporting.

THE RISKS OF IMPOSING FORMAL RULES

Emphasizing formal features, though, has its risks, especially with new researchers. It is easy to reduce formal structure to empty drill. Those who teach dancers only to hit their marks or pianists only to find the right keys deprive students of the deep pleasures of dance or music. Those who teach research *by the numbers*, as if it were merely learning the proper forms for footnotes and bibliography, deprive students of the pleasures of discovery, students who might otherwise have blessed the world with their own good research.

If students are shown how to approach research in the right spirit, the features of argument become not empty forms but answers to questions that stimulate and reward hard thinking. They help students recognize what is important in the relationship between a researcher, her sources, her disciplinary colleagues and readers. This recognition is a crucial prerequisite to creative and original research.

Forms empty of meaning encourage empty imitation, especially when teachers fail to create in their classrooms a rhetorical context that dramatizes for students their social role as researchers, even if at first only in simulation or role-playing. No textbook can fully create that context, because it requires a class experience that only imaginative teachers can orchestrate.

Only a teacher, understanding his unique students, can devise assignments that create situations whose social dynamic gives point and purpose to research and whose expectations students can recognize and understand. The less experience students have, the more social support teachers must provide before their students can use formal structures in productive ways.

ON ASSIGNMENT SCENARIOS: CREATING A GROUND FOR CURIOSITY

Teachers have found many ways to construct research assignments that give students this necessary support. The most successful have these features:

Good assignments establish outcomes beyond a product to be evaluated. Good teachers ask students to raise a question or problem that at least *they* want to resolve, and to support that resolution with reliable and relevant evidence. Good research assignments

then ask students to translate that private interest into a public one, so that they can experience, or at least imagine, readers who need the understanding that only they can provide.

The best assignments ask students to write for those who actually need to know or understand something better. Those readers might be a transient community of researchers that a problem creates, as when students do their research for a client outside of class. A senior design class, for example, might address a problem of a local company or civic organization; a music class might write program notes; a history class might investigate the origins of some part of their university or an institution in their local community.

Less experienced students might write for their classmates, but they might also write for students in another class who could actually use the information that a beginning researcher could provide. They might do preliminary research for those senior design students or for students in a graduate seminar; or they might even write reports back to students still in high school.

Next best are assignments that simulate such situations, in which students assume that other students or a client or even other researchers have a problem that the student researcher can resolve. Even in large classes, students can work in small groups whose members serve as readers with interests that beginning researchers can reasonably address.

Good assignments help students learn about their readers. Most students have trouble imagining readers whom they have never met and whose situation they have never experienced. Biology students with no knowledge or experience working with a government agency will be unlikely to write a plausible report that meets the concerns of a state EPA administrator. But teachers can help by urging students to imagine those distant readers. Alternatively, they can turn the class into its own audience by letting students decide what problems need solving, what questions need answering. If students can define the problems they're interested in, they will make the best possible readers for one another's research.

Good assignments create scenarios that are rich in contextual information. When students write to solve the problems of readers known and accessible to them, the assignment presents a scenario rich in detail. Students can investigate, interrogate, and analyze the situation for as long as time and ingenuity allow.

But when it's not practical to locate the project in a real context, the assignment should create as much of an imagined context as possible. It's impossible to predict everything students need to know about such a scenario, so it is important to make analysis and discussion of it a part of the writing process. Only when students are working in a social context do they have meaningful choices and good reasons to make them. Only then are those choices rhetorically significant. And only when writers can make rhetorically significant choices will they understand that at the heart of every real writing project is the anticipation of their readers' responses. When students have no choices because their project has no rhetorical "scene" and so is only a mechanical drill, doing research and writing it up become merely make-work—for you as much as for them.

Again we stress the importance of lively discussion among the students, either in class, if the class is small enough, or in subgroups if the class is large.

Good assignments provide interim readers. Few professional researchers call a report finished before they have solicited responses, something students need even more. Encourage students to solicit early responses from colleagues, friends, family, even from you. And build opportunities for response into the assignment itself. Other students can play this role reasonably well, but not if they think that their task is just "editing"—which for them often means rearranging a sentence here and fixing a misspelling there. Have student responders work through some of the steps in [chapters 12–17](#); you can even create teams of responders, each with responsibility for specific features of the text. Those who provide interim responses must participate in the scenario as imagined readers.

As with any real project, good assignments give students time and a schedule of interim deadlines. Research is messy, so it does no good to march students through it lockstep: (1) select topic, (2) state thesis, (3) write outline, (4) collect bibliography, (5) read and take notes, (6) write report. That caricatures real research. But students need some framework, a schedule of tasks that helps them monitor their progress. They need time for false starts and blind alleys, for revision and reconsideration. They need interim deadlines and stages for sharing and criticizing their progress. Those stages can reflect the various sequences outlined in this book.

RECOGNIZING AND TOLERATING THE INEVITABLE MESSINESS OF LEARNING

Students also seriously—sometimes desperately—need other kinds of support, especially recognition of what can be expected of them and tolerance for the predictable missteps of even experienced researchers. Beginners behave in awkward ways, taking suggestions and principles as inflexible rules that they apply mechanically. They work through a topic to a question to their library's online catalog to a few websites, marching on and on to a feeble conclusion, not because they lack imagination or creativity, but because they are struggling to acquire a skill that to them is surpassingly strange. Such awkwardness is an inevitable stage in learning any skill. It passes, but too often only after they have moved on to other classes.

We urge you not to be troubled when a whole class of beginning students produces reports that look alike. We have had to learn to be patient with students, as we wait for the delayed gratification that comes when the learners arrive at genuine originality—knowing it will likely come when we are no longer there to see it.

We try to assure students that even if they do not solve their problem, they succeed if they can pose it in a way that convinces us that it is new—at least to them—and arguably *needs* a solution. Proving that there is a problem to be solved often requires more research and more critical ability than solving it, certainly more than one in which a student can ask a simple question and answer it.

We know that some students use research assignments simply to gather information on a topic, to review a field just to gain control over it. To them, the demand for a significant problem seems artificial. You can only ask them to imagine that they are writing for a reader who is intelligent and possibly interested in their topic but does not have the time to do any research, a reader who is, indeed, in the circumstance they are in.

Finally, different students stand in different relations to the research practices you teach. Advanced students should strive toward the full quality of your own disciplinary practices. But few beginners are yet committed to any research community or to the values that underlie everything in this book. Some will make that commitment early, but most will not. Some never will. In sum, to teach research well, we teachers must adapt the steps we've outlined here to fit the particular circumstances and needs of the individuals before us in class. We can only hope that students at all levels learn these steps, learn to identify them in other writing projects, and then attempt them on their own. Maybe then

they can move toward the kind of sound research and reasoned decision-making that our society so badly needs but too seldom gets.

Method 25-Research Books can Be Used.

1. Look At The Research Folder
2. Decide The Book To Listen, Follow and Apply
 - Bernard Research Methods in Anthropology.
 - Qualitative Research & Evaluation Methods_ Integrating Theory and Practice.
 - Research Methodology - Methods and Techniques.
 - Research Methodology in the Medical and Biological Sciences.
 - Research Methods in Education.
 - Social-Research-Methods.
 - The Craft of Research, Fourth Edition (Chicago Guides to Writing, Editing, and Publishing.
 - The Oxford Handbook of Qualitative Research.
 - The Sage Encyclopedia of Qualitative Research Methods.
 - The SAGE Handbook of Qualitative Research.
 - The Language of Composition_ Reading, Writing, Rhetoric.
 - Patterns for College Writing_ A Rhetorical Reader and Guide.
 - How to Write Anything_ A Guide and Reference with Readings with 2009 MLA and 2010 APA Updates.
3. Use Intelligently skimming methods.
 - Method 1-Systematic Skimming or Pre-reading. Pages 47-51.
4. By skimming you will find the same sources, cited over and over again in the texts as the important go to works.
5. Use Rules of reading: Choose one of the methods.
 - For Basic Knowledge-Basic Level. Pages 66-74
 - For Analysis-Intermediate Level. Pages 141-307
 - Mixed Method-Advanced Level. Pages 341-942
6. Analysis of Logic.
7. Analysis of Grammar.

8. Discourse Analysis of The Text

A. Use the Following Books for Discourse Analysis:

- Critical Discourse Analysis_ The Critical Study of Language.
- Discourse analysis.
- The Routledge handbook of discourse analysis.

9. Analysis of Genre.

A. Open Figure Of Speech Folder. Use the Following Books for Analysis of Genre :

- Literary Device.
- FIGURES OF SPEECH - Biblical Research Journal.
- Figures of Speech.

10. Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context?

11. Facts within The Context.

12. Do the Fact Checking. Checking Facts, If they are correct or incorrect.

A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.

- Fact Checking Process.
- Verification Handbook.
- The Data Journalism.
- Data Journalism - Centre for Investigative Journalism.
- Tutorial-computational-fact-checking-a-content-management-perspective.
- Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
- Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
- The Effect of Fact-checking on Elites.
- Why do journalists fact-check.
- Fact-checking 101.
- Sagan-Baloney.
- Fact Checking.

B. Research the Facts, figures and ideas and do fact checking, if these are true or false through:

- C. Do full fact checking of the facts the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- D. Do full fact checking of the figures the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- E. Do full fact checking of the statistics the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- F. Do full fact checking of the formulas the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- G. Do full fact checking of the mathematical results the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- H. Do full fact checking of the evidences the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- I. Any other information author provided do full fact checking.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

13. Bias vs Unbiased

- A. Listen and read if the author is biased or unbiased.
- B. Is the author best representative for one or another side?
- C. Is the author bias or not? What is the author's bias and purpose?
- D. Does the speaker or writer have personal or professional interest in the information they are presenting?
- E. How a writer might purposely present ideas or events in ways that favour a particular political party/organisation/religion/social group?
- F. Does the author presents facts and explain the ideas to reader or listener?
- G. Is the author uses facts and opinions to argue for or against some idea?
- H. Is the author tries to amuse or interest the reader with humour, suspense, intense and stories?
- I. Look at the language in the passage?
 - If it is neutral and objective, the purpose is probably simply to inform the reader?
 - If is includes terms and are strongly positive, negative or emotional, the purpose is probably to persuade the reader?
 - It is include situations or descriptions that are funny, surprising or intriguing the writer, probably wants to entertain the reader?
- J. Is the author biased?
 - Is the author presenting only one side of an argument?
 - Is it include only facts and examples that support writer's opinion?
 - Is it using the language intended to influence the reader's emotions?
 - Is it ridicules other opinions or views?
- K. Does the author have contradictory information, cherry picked evidence or carefully select language in which to present information favourably?
- L. Is the author or speaker speaks/writes for company, special interest group, an institute foundation think tank or political party?
- M. Does the author/writer gets paid or provided any gift for endorsement or opinion?
- N. Does the person have interest on this topic or has any personal gain? If not then this writer/speaker is disinterested, impartial/unbiased objective.
- O. If the speaker/writer has interest, then why does she/he present the information/ data in such a way?
- P. In surveys or studies has the author worded the question in such a way to ensure the sought-after response?

- Q. Is the company paid the author to prove that the device or product is better than any other product in the market?
- R. Is the marketer or industry trying to defend the product? Did the author put the best spin on its information?
- S. When was the survey or studies or experiment done?
- T. What day were the tests, survey or experiment done?
- U. Purpose of the author writing?
- V. How did the author handle opposing views? Is the author trying to persuade the reader to some belief?
- W. Does the author fairly handle the opposing view? Or did the author dismiss opposing points without regard to their possible value?
- X. Does the writer make any straw man fallacy, misrepresenting opposing views to more easily knock them down?
- Y. Did the author use slanted language or commit personal attack?
- Z. Does the writer use sweeping generalisation or demonstrate an either/or approach to complicated issues, thereby revealing a strong bias toward one side?
- AA. Does the writer pretend to be objective?
- BB. Does the writer intend to be ironic or satirical, if she or he is clearly exaggerating for effect?
- CC. Does the writer admit to guesswork and speculation?

14. Checking Each Fact's Sources, If they Are Reliable or Unreliable. Sources the author used

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Listen or read what sources of information Author used
- C. What are the author's sources?
- Did the writer respond to those who have preceded them?
 - Has the writer depended on the primary/secondary/tertiary sources?
 - Has the writer misquoted the primary/secondary/tertiary or has he quoted the primary/secondary/tertiary source?
 - Has the writer uses statistics or data, has he used primary/secondary/tertiary source?
 - Has the writer interpreted the data or survey or statistics biased/unbiased?
 - Has the author correctly interpreted the information?
 - Has the author incorrectly interpreted information?
 - Search the very sources author uses and see if the author interpreted the information in correct way.
 - Has the author uses trust sources for the work he has written?

D. Is the Source Reliable or Unreliable?

E. Sources

- Is the author uses primary source in presenting some data or facts in his/her newspaper, article, book journal?
 1. Is the primary source reliable, fair, ethical and trustworthy?
 2. Is the primary source sloppy, biased, unethical?
 3. Is the primary source objective when they speaking about certain subject?
 4. Are the primary source present facts carefully or careless?
 5. Is the primary source truthfully presenting the facts, opinions and data?
 6. Who is the writer? Is he /she qualified expert to write about this topic?
 7. Did the write done proper research regarding the topic?
 8. What is the tone?
 9. What is the purpose of publication?
 10. What assumption does the author make?
 11. What are the bases of author's conclusions?
 12. Does the author agree or disagree with other authors on the subject?
 13. Was this written in regards of the counterargument other authors who have opposite views?
 14. Does the content agree or disagree with author/authors on the subject?
 15. Does the content agree or disagree with what you know or have learned about the issue?
 16. Where was the source made?
 17. Where is the material from? Is this a valid source of information?

F. Is the Source Reliable or Unreliable?

- What primary sources did the author use. This is the list of primary source:
 1. Data and original research.
 2. Diaries and journals.
 3. Letters and memos.
 4. Autobiographies and memoirs.
 5. Books or articles written at the time of event?
 6. Government documents.
 7. Census statistics.
 8. Organisational records.
 9. Documentaries.
 10. photographs, art (from the time period).
 11. Maps (from the period).
 12. Patents.
 13. Theses.
 14. Dissertations.
 15. Photographs.
 16. Journal articles.
 17. Newspaper articles.
 18. Survey research research.
 19. Meetings.
 20. Symposia.
 21. Original documents.
 22. Records of organisation.
 23. Internet.
 24. Email.
 25. Communication in listservs.
 26. Interviews.
 27. Video recordings.
 28. Audio recordings.
 29. Websites.
 30. Communication through social media.
 31. Artefacts.
 32. Reports.
 33. Works of art and architecture.
 34. Eyewitness.

- 35. Statistics.
- 36. Oral history.
- 37. Description of travel.
- 38. Cartoon.
- 39. Postcards.
- 40. Posters.
- 41. Internet communications.
- 42. Any above reprinted in the original format and language.

- Is the author use secondary source in presenting some data or facts in his/her newspaper, articles, book, magazine/, journal?
 1. Is the second hand source reliable, fair ethical and trustworthy?
 2. Is the second hand source being sloppy, biased, unethical in their quoting paraphrasing and summarising?
 3. Is the secondary source objectively when they are speaking about certain subject?
 4. Are the secondary source present facts carefully or careless?
 5. Is the secondary source truthfully presents the facts opinions/data?
 6. Is the secondary data was accepted blind faith or skeptically analysed by author?
 7. What secondary source did the author use? This is the list of secondary sources:
 - Encyclopedia
 - Chronologies
 - Biographies
 - Monographs
 - Most journal article
 - Literary criticism
 - Political analysis
 - Review of law and legislations
 - Essay on morals and ethics
 - Analyses of social policy
 - Study and teaching material
 - Literature reviews
 - Research articles
 - Criticism of works of literature, art and music
 - Most published books
 - Abstract of articles
 - Paraphrased quotation
 - Dictionaries
 - Textbooks
 - Commentaries
 - Magazines and newspaper articles
 - Website

8. Is the Source Reliable or Unreliable?

- Is the author use tertiary source in presenting some data or facts in her newspaper, articles, book journal or magazine

1. Is the tertiary hand source reliable, fair, ethical and trustworthy?
2. Is the tertiary hand source being sloppy, biased, unethical in their quoting, paraphrasing and summarising.
3. Is the tertiary source objectively when they are speaking about certain subject?
4. Are the tertiary source present facts carefully or careless?
5. Is the tertiary source truthfully presents the facts opinions/data?
6. Is the tertiary data was accepted blind faith or skeptically analysed by author?

7. What tertiary source did the author use? List:

- Almanacs
- Bibliographies
- Classification
- Population registers
- Chronologies
- Dictionaries
- Encyclopedias
- Directories
- Fact books
- Guidebooks
- Indexes
- Abstract sources
- Manuals textbooks
- Handbooks
- Wikipedia
- Concordance
- Field guides
- Timelines
- Surveys
- Overview articles
- Directories

8. Is the Source Reliable or Unreliable?

14. Rhetorical Analysis Of The Text

A. Open Rhetorical Analysis Folder. Use The Following Books For Rhetorical Analysis of The Book:

- Rhetoric By Aristotle.
- A Companion to Rhetoric and Rhetorical Criticism.
- Ancient Rhetoric From Aristotle to Philostratus.
- Ancient Rhetoric For Contemporary Students by Sharon Crowley.
- Art Of Rhetoric By Aristotle.
- Conversations In American Literature: Language, Rhetoric, Culture By Robin Aufses.
- Encyclopaedia of Rhetoric.
- On Rhetoric: Theory of Civic Discourse by Aristotle.
- Politics and Rhetoric: The Persuasive Power of Metaphor.
- Rhetoric By Jennifer Richards.
- Rhetoric In Details By John Benjamins.
- Rhetorical Grammar By Martha Kolln.
- Sourcebook on Rhetoric By James Jasinski.
- The Language of Composition: Reading, Writing, Rhetoric by Renee Shea.
- The Longman Writer_ Rhetoric, Reader, Research Guide, and Handbook.
- The Rhetoric of Reason By James Crosswhite.
- Trivium- Liberal Arts of Logic, Grammar and Rhetoric By Sister Mirriam Joseph.
- Writing Arguments: a RHETORIC With Reading by John Ramage.

B. Follow Every step of the Book, I have chose to do Rhetorical Analysis.

15. Take notes on literature.

16. By reading, you will identify certain questions within the area of research.

17. Master the literature in the area of research.

18. Use Rules of Writing.

Investigative Journalism

Method 26- Investigative Journalism

1. Open Investigative Journalism Folder. Choose and Use One Of The Following Books From Investigative Journalism Research Book and Follow Every Step:

- **Skimming- Rules of Reading Page 47-51.**
- **Method 1-Speed Reading. Very FAST Reading. Pages 59-64.**
- **FAST READING: Methods for Basic Knowledge For Deep Work or Bible Study. Methods 1-6. Rules of reading pages 66-74.**
- **Deep Work, Deep Study, Bible Study or Any Book- SLOW Reading- Complex Text. Rules of Reading Pages 141-307.**
- **VERY VERY SLOW READING- COMPLEX TEXT. Deep Work, Shallow Work, Bible Study, Analysis of Text, Research, Investigative Journalism, Investigation and Syntopicon, Mixed Method. Rules of Reading Pages 341-942.**
- **How To Read A Book By Mortimer Adler.**
- **How To Become a Mouthpiece for The People: a Manual For Investigative Journalism.**
- **Investigative Journalism Handbook.**
- **Investigative Journalism By Hugo De Burgh.**
- **Journalism-New_Challenges-Fowler.**
- **Journalism of Ideas.**
- **Investigative and Interpretative Journalism.**
- **Story Based Inquiry: a manual for investigative Journalism.**
- **The Global Investigative Journalism Casebook.**
- **The Future OF Computer Assisted Reporting.**
- **A Watchdog Guide to Investigative Reporting.**
- **Basic Private Investigation_ A Guide to Business Organization, Management, and Basic Investigative Skills for the Private Investigator.**
- **What is Investigative Journalism.**
- **CIMA-Investigative Journalism - Dave Kaplan.**
- **CIPE_2009_Investigative Reporting Toolkit.**
- **Citizen Investigation.**
- **Computer-assisted reporting in Australia_ diffusion of the intern.**

- **Criminal Investigation for the Professional Investigator (Professional Investigators.**
- **Digital Investigative Journalism.**
- **Introduction to Journalism By Richard Rudin.**
- **Journalism Under Fire.**
- **The Future of Cross Border Investigative Journalis, By Muckraking.**
- **Investigative and Interpretative Reporting MAC 214.**
- **Notes on Investigative Journalism.**
- **Tell Me No Lies by John Pilger.**
- **Inquiry Into The Future of Investigative Journalism By Aljeezera.**
- **The Global Casebook: An Anthology for Teacher and Students of Investigative Journalism.**
- **10 Steps To Investigative reporting.**
- **Investigative Reporting In Zambia: Practitioner's Handbook.**
- **Investigative Journalism Techniques.**
- **Research Methods.**

2. Decide The Book To Listen, Follow and Apply

3. Follow Each steps.

4. Use Intelligently skimming methods.

- **Method 1-Systematic Skimming or Pre-reading.**

5. By skimming you will find the same sources, cited over and over again in the texts as the important go to works.

6. Choose Use Rules of reading Method. Follow each step of the method on every step of the investigative journalism I will be taken.

- **For Basic Knowledge-Basic Level.**
- **For Analysis-Intermediate Level.**
- **Mixed Method-Advanced Level.**

7. Step 1. Create a tentative bibliography of your subject by recourse to library catalogues, advisors, and bibliographies in books.

8. Step 2. Inspect *all* of the books on the tentative bibliography to ascertain which are germane to your subject, and also to acquire a clearer idea of the subject.
Note: These two steps are not, strictly speaking, chronologically distinct; that is, the two steps have an effect on each other, with the second, in particular, serving to modify the first.

9. Step 3: Data Journalism and Investigative Journalism and Reporting Toolkit. Open Investigative Journalism Folder. Choose and Use One Of The Following Books From Data Journalism and Investigative Journalism Toolkit and Follow Every Step:

- **Model Curricula For Journalism Education.**
- **Safety for journalism.**
- **The Journalism Handbook Toward Critical Data Practise.**
- **Investigative Research Links.**
- **Bellingcat Digital Toolkit.**
- **Citizen.**
- **Data JournLISM- cENTRE FOR iNVESTIGATIVE jOURNALISM.**
- **Creating Freelance Career.**
- **Digital Tool.**
- **How To Fund Investigative Journalism.**
- **Freelance to Freedom.**
- **Resource Book On Investigative Journalism.**
- **Freelance Bible.**
- **The Self Publishing Menu.**
- **The Data jOURNALISM hANDBOOK.**

10. Step 4: Analyse Accounts And The Resources I have Gathered. Open Investigative Journalism Folder. Choose and Use One Of The Following Books From Analyse Business, Accounting Book and Follow Every Step:

- **Accounting All-in-One For Dummies.**
- **Accounting For Dummies.**
- **Bookkeeping and Accounting All-in-One For Dummies.**
- **Business Math For Dummies (For Dummies (Business & Personal Finance.**
- **Business Start Up For Dummies Three e-book Bundle_ Starting a Business For Dummies, Business Plans For Dummies, Understanding Business Accounting.**
- **Cash Flow.**
- **Complete MBA.**
- **Financial Accounting For Dummies.**
- **Financial Investigation and Forensic Accounting, Third Edition.**
- **CFA 1-3 Levels.**
- **Accounting ACCA F 1-9 AND P1-7.**
- **Follow Money.**
- **Forensic and Investigative Accounting.**
- **Forensic Science_ Fundamentals and Investigations.**
- **Fundamental Analysis For Dummies.**
- **How to Read A Financial Report (Wringing Vital Signs Out Of The Numbers).**
- **How to Read a Financial Report_ Wringing Vital Signs Out of the Numbers.**
- **Managerial Accounting For Dummies.**
- **Money Laundering _ A Guide for Criminal Investigators.**
- **Reading financial reports for dummies.**
- **The Personal MBA_ Master the Art of Business.**
- **Training Manual-Reporting on Corruption Investigative Journalism.**

11. Step 5: Analyse Resources I have Gathered. Open Investigative Journalism Folder. Choose and Use One Of The Following Books From Other Books and Follow Every Step

- Who is Running The Company.
- Corporate Governance.
- How to Analyze People at First Sight.
- How to Avoid Being Killed in a War Zone_ The Essential Survival Guide for Dangerous Places.
- Information Security for Journalism.
- investigating local govt.
- Investigating,Companies,A,DIY,Handbook,University,of,Liverpool.
- Learn to Earn_ A Beginner's Guide to the Basics of Investing and Business.
- Predictive analytics for dummies.
- Spy the Lie_ Former CIA Officers Teach You How to Detect Deception.
- Verification Handbook.

12. STEP 12 IN SYNTOPICAL READING: FINDING THE RELEVANT PASSAGES. Since we are of course assuming that you know how to read analytically, we are assuming that you could read each of the relevant books thoroughly if you wanted to. But that would be to place the individual books first in the order of your priorities, and your problem second. In fact, the order is reversed. *In syntopical reading, it is you and your concerns that are primarily to be served, not the books that you read. First,* the topic in connection with which the passage is being read serves to give direction to the reader in interpreting the passage. But it does not tell him what the passage means, since the passage may be relevant to the topic in several or many different ways. Hence the reader is called upon to *discover precisely what relevance the passage has to the topic.* To learn to do this is to acquire a major skill in the art of reading.

13. STEP 13 Use Rules of Reading by Analysing the various text. IN SYNTOPICAL READING: BRINGING THE AUTHORS TO TERMS. In interpretive reading (the second stage of analytical reading) the first rule requires you to come to terms with the author, which means identifying his key words and discovering how he uses them. But now you are faced with a number of different authors, and it is unlikely that they will have all used the same words, or even the same terms. *Thus it is you who must establish the terms, and bring your authors to them rather than the other way around.* *First* the collection of a number of passages on the same topic, but from different works and different authors, serves to *sharpen the reader's interpretation of each passage read.* Sometimes, when passages from the same book are read in sequence and in the context of one another, each becomes clearer. Sometimes the meaning of each of a series of contrasting or conflicting passages from different books is accentuated when they are read against one another. And sometimes the passages from one author, by amplifying or commenting on the passages from another, materially help the reader's understanding of the second author. *Second* if syntopical reading is done on a number of different subjects, the fact that the same passage will often be found cited in the Syntopicon under two or more subjects will have its instructive effect. The passage has an amplitude of meaning that the reader will come to perceive as he interprets it somewhat differently in relation to different topics. Such multiple interpretation not only is a basic exercise in the art of reading but also tends to make the mind habitually alert to the many strains of meaning that any rich or complex passage can contain. This is probably the most difficult step in syntopical reading. What it really comes down to is forcing an author *to use your language, rather than using his.* All of our normal reading habits are opposed to this. As we have pointed out several times, we assume that the author of a book we want to read analytically is our better, and this is particularly true if the book is a great one. Our tendency is to accept the author's terms and his organization of the subject matter, no matter how active we may be in trying to understand him. In syntopical reading, however, we will very quickly be lost if we accept any one author's terminology. We may understand *his* book, but we will fail to understand the others, and we will find that not much light is shed on the subject in which we are interested. Not only must we resolutely refuse to accept the terminology of *any one* author; we must also be willing to face the possibility that *no* author's terminology will be useful to us. In other words, we must accept the fact that coincidence of terminology between us and any of the authors on our list is merely accidental. Often, indeed, such coincidence will be inconvenient; for if we use one term or set of terms of an author, we may be tempted to use others among his terms, and these may get in the way rather than help. Syntopical reading, in short, is to a large extent an exercise in translation. We do not have to translate from one natural language to another, as from French to English. But we do impose a common terminology on a number of authors who, whatever natural language they may have shared in common, may not have been specifically concerned with the problem we are trying to solve, and therefore may not have created the

ideal terminology for dealing with it. This means that as we proceed on our project of syntopical reading we must begin to build up a set of terms that first, helps us to understand all of our authors, not just one or a few of them, and second, helps us to solve our problem. That insight leads to the third step.

14. STEP 14 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: GETTING THE QUESTIONS CLEAR. The second rule of interpretive reading requires us to find the author's key sentences, and from them to develop an understanding of his propositions. Propositions are made up of terms, and of course we must do a similar job on the works we are reading syntopically. But since we ourselves are establishing the terminology in this case, *we are faced with the task of establishing a set of neutral propositions as well*. The best way to do this is to frame a set of questions that shed light on our problem, and to which each of our authors gives answers. This, too, is difficult. The questions must be stated in such a way and in such an order that they help us to solve the problem we started with, but they also must be framed in such a way that all or most of our authors can be interpreted as giving answers to them. The difficulty is that the questions we want answered may not have been seen as questions by the authors. Their view of the subject may have been quite different from ours. Sometimes, indeed, we have to accept the fact that an author gives *no* answer to one or more of our questions. In that case, we must record him as silent or indeterminate on the question. But even if he does not discuss the question explicitly, we can sometimes find an implicit answer in his book. *If* he had considered the question, we may conclude, he would *then* have answered it in such and such a way. Restraint is necessary here; we cannot put thoughts into our authors' minds, or words into their mouths. But we also cannot depend entirely on their explicit statements about the problem. If we could depend on any one of them in that way, we probably would have no problem to solve. We have said that the questions must be put in an order that is helpful to us in our investigation. The order depends on the subject, of course, but some general directions can be suggested. The first questions usually have to do with *the existence or character of the phenomenon or idea we are investigating*. If an author says that the phenomenon exists or that the idea has a certain character, then we may ask further questions of his book. These may have to do with *how the phenomenon is known or how the idea manifests itself*. A final set of questions might have to do with *the consequences of the answers to the previous questions*. We should not expect that all of our authors will answer our questions in the same way. If they did, we would once again have no problem to solve; it would have been solved by consensus. Since the authors will differ, we are faced with having to take the next step in syntopical reading.

15. STEP 15 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: DEFINING THE ISSUES. If a question is clear, and if we can be reasonably certain that authors answer it in different ways— perhaps pro and con—then an issue has been defined. It is the issue between the authors who answer the question in one way, and those who answer it in one or another opposing way.

16. STEP 16 Use One of Rules of Reading Methods For Full Analysis of Texts.

17. STEP 17 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Context Of Author's text.

1. What is Immediate Context?
2. What is the Book Context?

18. STEP 18 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. What are The Facts Within Context of an Author.

19. STEP 19 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Grammar Of Texts.

20. STEP 20 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Logic Of Texts.

21. Step 21- Discourse Analysis of The Text

A. Use the Following Books for Discourse Analysis:

- Critical Discourse Analysis_ The Critical Study of Language.
- Discourse analysis.
- The Routledge handbook of discourse analysis.

22. Step 22- Facts within The Context.

23. Step 23- Do the Fact Checking. Checking Facts, If they are correct or incorrect.

A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.

- Fact Checking Process.
- Verification Handbook.
- The Data Journalism.
- Data Journalism - Centre for Investigative Journalism.
- Tutorial-computational-fact-checking-a-content-management-perspective.
- Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
- Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
- The Effect of Fact-checking on Elites.
- Why do journalists fact-check.
- Fact-checking 101.
- Sagan-Baloney.
- Fact Checking.

B. Research the Facts, figures and ideas and do fact checking, if these are true or false through:

- Wikipedia
- E-book

- C. Do full fact checking of the facts the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- D. Do full fact checking of the figures the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- E. Do full fact checking of the statistics the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- F. Do full fact checking of the formulas the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- G. Do full fact checking of the mathematical results the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- H. Do full fact checking of the evidences the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- I. Any other information author provided do full fact checking.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

24. Step 24 Bias vs Unbiased

- A. Listen and read if the author is biased or unbiased.
- B. Is the author best representative for one or another side?
- C. Is the author bias or not? What is the author's bias and purpose?
- D. Does the speaker or writer have personal or professional interest in the information they are presenting?
- E. How a writer might purposely present ideas or events in ways that favour a particular political party/organisation/religion/social group?
- F. Does the author presents facts and explain the ideas to reader or listener?
- G. Is the author uses facts and opinions to argue for or against some idea?
- H. Is the author tries to amuse or interest the reader with humour, suspense, intense and stories?
- I. Look at the language in the passage?
 - If it is neutral and objective, the purpose is probably simply to inform the reader?
 - If is includes terms and are strongly positive, negative or emotional, the purpose is probably to persuade the reader?
 - It is include situations or descriptions that are funny, surprising or intriguing the writer, probably wants to entertain the reader?
- J. Is the author biased?
 - Is the author presenting only one side of an argument?
 - Is it include only facts and examples that support writer's opinion?
 - Is it using the language intended to influence the reader's emotions?
 - Is it ridicules other opinions or views?
- K. Does the author have contradictory information, cherry picked evidence or carefully select language in which to present information favourably?
- L. Is the author or speaker speaks/writes for company, special interest group, an institute foundation think tank or political party?
- M. Does the author/writer gets paid or provided any gift for endorsement or opinion?
- N. Does the person have interest on this topic or has any personal gain? If not then this writer/speaker is disinterested, impartial/unbiased objective.
- O. If the speaker/writer has interest, then why does she/he present the information/ data in such a way?
- P. In surveys or studies has the author worded the question in such a way to ensure the sought-after response?

- Q. Is the company paid the author to prove that the device or product is better than any other product in the market?
- R. Is the marketer or industry trying to defend the product? Did the author put the best spin on its information?
- S. When was the survey or studies or experiment done?
- T. What day were the tests, survey or experiment done?
- U. Purpose of the author writing?
- V. How did the author handle opposing views? Is the author trying to persuade the reader to some belief?
- W. Does the author fairly handle the opposing view? Or did the author dismiss opposing points without regard to their possible value?
- X. Does the writer make any straw man fallacy, misrepresenting opposing views to more easily knock them down?
- Y. Did the author use slanted language or commit personal attack?
- Z. Does the writer use sweeping generalization or demonstrate an either/or approach to complicated issues, thereby revealing a strong bias toward one side?
- AA. Does the writer pretend to be objective?
- BB. Does the writer intend to be ironic or satirical, if she or he is clearly exaggerating for effect?
- CC. Does the writer admit to guesswork and speculation?

25. Step 25. Checking Each Fact's Sources, If they Are Reliable or Unreliable.

Sources the author used

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Listen or read what sources of information Author used
- C. What are the author's sources?
- Did the writer respond to those who have preceded them?
 - Has the writer depended on the primary/secondary/tertiary sources?
 - Has the writer misquoted the primary/secondary/tertiary or has he quoted the primary/secondary/tertiary source?
 - Has the writer uses statistics or data, has he used primary/secondary/tertiary source?
 - Has the writer interpreted the data or survey or statistics biased/unbiased?
 - Has the author correctly interpreted the information?
 - Has the author incorrectly interpreted information?
 - Search the very sources author uses and see if the author interpreted the information in correct way.
 - Has the author uses trust sources for the work he has written?

D. Is the Source Reliable or Unreliable?

E. Sources

- Is the author uses primary source in presenting some data or facts in his/her newspaper, article, book journal?
 1. Is the primary source reliable, fair, ethical and trustworthy?
 2. Is the primary source sloppy, biased, unethical?
 3. Is the primary source objective when they speaking about certain subject?
 4. Are the primary source present facts carefully or careless?
 5. Is the primary source truthfully presenting the facts, opinions and data?
 6. Who is the writer? Is he /she qualified expert to write about this topic?
 7. Did the write done proper research regarding the topic?
 8. What is the tone?
 9. What is the purpose of publication?
 10. What assumption does the author make?
 11. What are the bases of author's conclusions?
 12. Does the author agree or disagree with other authors on the subject?
 13. Was this written in regards of the counterargument other authors who have opposite views?
 14. Does the content agree or disagree with author/authors on the subject?
 15. Does the content agree or disagree with what you know or have learned about the issue?
 16. Where was the source made?
 17. Where is the material from? Is this a valid source of information?

F. Is the Source Reliable or Unreliable?

- What primary sources did the author use. This is the list of primary source:
 1. Data and original research.
 2. Diaries and journals.
 3. Letters and memos.
 4. Autobiographies and memoirs.
 5. Books or articles written at the time of event?
 6. Government documents.
 7. Census statistics.
 8. Organisational records.
 9. Documentaries.
 10. photographs, art (from the time period).
 11. Maps (from the period).
 12. Patents.
 13. Theses.
 14. Dissertations.
 15. Photographs.
 16. Journal articles.
 17. Newspaper articles.
 18. Survey research research.
 19. Meetings.
 20. Symposia.
 21. Original documents.
 22. Records of organisation.
 23. Internet.
 24. Email.
 25. Communication in listservs.
 26. Interviews.
 27. Video recordings.
 28. Audio recordings.
 29. Websites.
 30. Communication through social media.
 31. Artefacts.
 32. Reports.
 33. Works of art and architecture.

- 34. Eyewitness.
- 35. Statistics.
- 36. Oral history.
- 37. Description of travel.
- 38. Cartoon.
- 39. Postcards.
- 40. Posters.
- 41. Internet communications.
- 42. Any above reprinted in the original form and language.

- Is the author use secondary source in presenting some data or facts in his/her newspaper, articles, book, magazine/, journal?
 1. Is the second hand source reliable, fair ethical and trustworthy?
 2. Is the second hand source being sloppy, biased, unethical in their quoting paraphrasing and summarising?
 3. Is the secondary source objectively when they are speaking about certain subject?
 4. Are the secondary source present facts carefully or careless?
 5. Is the secondary source truthfully presents the facts opinions/data?
 6. Is the secondary data was accepted blind faith or skeptically analysed by author?
 7. What secondary source did the author use? This is the list of secondary sources:
 - Encyclopedia
 - Chronologies
 - Biographies
 - Monographs
 - Most journal article
 - Literary criticism
 - Political analysis
 - Review of law and legislations
 - Essay on morals and ethics
 - Analyses of social policy
 - Study and teaching material
 - Literature reviews
 - Research articles
 - Criticism of works of literature, art and music
 - Most published books
 - Abstract of articles
 - Paraphrased quotation
 - Dictionaries
 - Textbooks
 - Commentaries
 - Magazines and newspaper articles
 - Website

8. Is the Source Reliable or Unreliable?

- Is the author use tertiary source in presenting some data or facts in her newspaper, articles, book journal or magazine
 1. Is the tertiary hand source reliable, fair, ethical and trustworthy?
 2. Is the tertiary hand source being sloppy, biased, unethical in their quoting, paraphrasing and summarising.
 3. Is the tertiary source objectively when they are speaking about certain subject?
 4. Are the tertiary source present facts carefully or careless?
 5. Is the tertiary source truthfully presents the facts opinions/data?
 6. Is the tertiary data was accepted blind faith or skeptically analysed by author?
 7. What tertiary source did the author use? List:
 - Almanacs
 - Bibliographies
 - Classification
 - Population registers
 - Chronologies
 - Dictionaries
 - Encyclopedias
 - Directories
 - Fact books
 - Guidebooks
 - Indexes
 - Abstract sources
 - Manuals textbooks
 - Handbooks

 - Directories
 8. Is the Source Reliable or Unreliable?

26. STEP 26 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. Analysis of Rhetoric Of Texts.

A. Open Rhetorical Analysis Folder. Use The Following Books For Rhetorical Analysis of The Book:

- Rhetoric By Aristotle.
- A Companion to Rhetoric and Rhetorical Criticism.
- Ancient Rhetoric From Aristotle to Philostratus.
- Ancient Rhetoric For Contemporary Students by Sharon Crowley.
- Art Of Rhetoric By Aristotle.
- Conversations In American Literature: Language, Rhetoric, Culture By Robin Aufses.
- Encyclopaedia of Rhetoric.
- On Rhetoric: Theory of Civic Discourse by Aristotle.
- Politics and Rhetoric: The Persuasive Power of Metaphor.
- Rhetoric By Jennifer Richards.
- Rhetoric In Details By John Benjamins.
- Rhetorical Grammar By Martha Kolln.
- Sourcebook on Rhetoric By James Jasinski.
- The Language of Composition: Reading, Writing, Rhetoric by Renee Shea.
- The Longman Writer_ Rhetoric, Reader, Research Guide, and Handbook.
- The Rhetoric of Reason By James Crosswhite.
- Trivium- Liberal Arts of Logic, Grammar and Rhetoric By Sister Mirriam Joseph.
- Writing Arguments: a RHETORIC With Reading by John Ramage.

B. Follow Every step of the Book, I have chose to do Rhetorical Analysis.

C. When only two answers are given by all of the authors examined, the issue is a relatively simple one. Often, more than two alternative answers are given to a question. In that case, the opposing answers must be ordered in relation to one another, and the authors who adopt them classified according to their views. An issue is truly joined when two authors who understand a question in the same way answer it in contrary or contradictory ways. But this does not happen as often as one might wish. Usually, differences in answers must be ascribed to *different conceptions of the question* as often as to *different views of the subject*. The task of the syntopical reader is to define the issues in such a way as to

insure that they are joined as well as may be. Sometimes this forces him to frame the question in a way that is not explicitly employed by any author. There may be many issues involved in the discussion of the problem we are dealing with, but it is likely that they will fall into groups. Questions about the character of the idea under consideration, for example, may generate a number of issues that are connected. A number of issues revolving around a closely connected set of questions may be termed the *controversy* about that aspect of the subject. Such a controversy may be very complicated, and it is the task of the syntopical reader to sort it out and arrange it in an orderly and perspicuous fashion, even if no author has managed to do that. This sorting and arranging of the controversies, as well as of the constituent issues, brings us to the final step in syntopical reading.

27. STEP 27 Use Rules of Reading by reading the various text. IN SYNTOPICAL READING: ANALYSING THE DISCUSSION. So far we have found the relevant passages in the works examined, created a neutral terminology that applies to all or most of the authors examined, framed and ordered a set of questions that most of them can be interpreted as answering, and defined and arranged the issues produced by differing answers to the questions. What then remains to be done? The first four steps correspond to the first two groups of rules for analytical reading. Those rules, when followed and applied to any book, allowed us to answer the questions, What does it say? and How does it say it? In our syntopical reading project, we are similarly able at this point to answer the same questions about the discussion concerning our problem. In the case of the analytical reading of a single work, two further questions remained to be answered, namely, Is it true? and What of it? In the case of syntopical reading, we are now prepared to address ourselves to similar questions about the discussion. Let us assume that the problem with which we began was not a simple one, but was rather one of those perennial problems with which thinkers have struggled for centuries, and about which good men have disagreed and can continue to disagree. We should recognize, on this assumption, that our task as syntopical readers is not merely to answer the questions ourselves—the questions that we have so carefully framed and ordered both to elucidate the discussion of the subject and the subject itself. The truth about a problem of this sort is not found so easily. In fact, we would probably be presumptuous to expect that the truth could be found in any one set of answers to the questions. Rather, it is to be found, if at all, in *the conflict of opposing answers*, many if not all of which may have persuasive evidence and convincing reasons to support them. The truth, then, insofar as it can be found—the solution to the problem, insofar as that is available to us—consists rather in the *ordered discussion itself* than in any set of propositions or assertions about it. Thus, in order to present

this truth to our minds—and to the minds of others—we have to do more than merely ask and answer the questions. We have to ask them in a certain order, and be able to defend that order; we must show how the questions are answered differently and try to say why; and we must be able to point to the texts in the books examined that support our classification of answers. Only when we have done all of this can we claim to have analysed the discussion of our problem. And only then can we claim to have understood it. We may, indeed, have done more than that. A thorough analysis of the discussion of a problem may provide the groundwork for further productive work on the problem by others. It can clear away the deadwood and prepare the way for an original thinker to make a breakthrough. Without the work of analysis, that might not have been possible, for the dimensions of the problem might not have been visible.

28. Take notes on literature.

29. By reading, you will identify certain questions within the area of research.

30. Master the literature in the area of research.

31. Use Rules of Writing.

Mixed Method

Method 27-Mixed Methods of Rules of Reading

1. Decide, What Rules of Reading Method I Will Use For Following:

- I. Reading.**
- II. Deep Work.**
- III. Listening.**
- IV. Analysis.**
- V. Thinking.**
- VI. Learning.**
- VII. Study.**
- VIII. Investigative Journalist.**
- IX. Syntopicon.**
- X. Research.**
- XI. Asking Questions.**
- XII. Doing.**

2. Choose One of the Method of Rules of Reading For Following:.

A. VERY VERY FAST Reading- Skimming. Pages 47-51.

B. VERY FAST READING- Entertainment.

I. Method 1-Speed Reading. FAST Reading. Pages 59-64.

C. FAST READING: Methods for Basic Knowledge For Deep Work or Bible Study.

I. Method 1-Survey, Question, Read, Recite, Record, Reflect (SQR4). Pages 66-67.

II. Method 2-Use 80/20 Principle For Reading. Pages 68.

III. Method 3-Preview, Question, Read, Summary,Test (PQRST). Page 69.

IV. Method 4-Flip Through Pages and Analyse. Page 70.

V. Method 5-Devotional Bible Study by Using Devotional Books. Pages 71-72.

VI. Method 6-Devotional Bible Read. Pages 73-74.

D. Deep Work, Deep Study, Bible Study or Any Book- SLOW Reading- Complex Text.

I. Method 1-Chapter Summary Method. Pages 143-147.

II. Method 2-Character Quality Method. Pages 148-160.

III. Method 3-Thematic Method. Pages 161-163.

IV. Method 4-Biographical Method. Pages 164-176.

V. Method 5-Topical Method. Pages 177-180.

VI. Method 6-Word Study Method. Pages 181-189.

VII. Method 7-Book Background Method. Pages 190-194.

VIII. Method 8-Book Survey Method. Pages 195-205.

IX. Method 9-Chapter Analysis Method. Pages 206-215.

X. Method 10-Paragraph Study. Pages 216-229.

XI. Method 11-Verse by Verse Analysis Method. Pages 230-234.

XII. Method 12-Book Synthesis Method. Pages 235-238.

XIII. Method 13-Theological Study Method of Bible Study. Pages 239-245.

XIV. Method 14-Studying Bible Prophecy. Pages 246-259.

XV. Method 15-Typological Study Method. Pages 260-262.

XVI.Method 16- John MacArthur Way Bible Study. Pages 263-268.

XVII.Method 17-Inductive Bible Study Method. Pages 269-296.

XVIII.Method 18-BIBLICAL HERMENEUTICS. Pages 297-302.

XIX.Method 19-Theological Group of Principles. Pages 303-306.

XX.Method 20- How To Read A Book Pages 307.

E. VERY VERY SLOW READING- COMPLEX TEXT. Deep Work, Shallow Work, Bible Study, Analysis of Text, Research, Investigative Journalism, Investigation and Syntopicon, Mixed Method.

I. Method 21- How To Read A Book By Mortimer Adler Various edition Pages 341.

II. Method 22-How To Read A Book For Various Books. Pages 342-600.

III. Method 23- Syntopicon Pages 601-642.

IV. Method 24-The Craft of Research. Pages 644-882.

V. Method 25-Research Books can Be Used. Pages 883-897.

VI. Method 26-Investigative Journalism. Pages 898-923.

VII. Method 27-Mixed Methods of Rules of Reading. Pages 924-942.

3. Analysis of Logic.

4. Analysis of Grammar.

5. Discourse Analysis of The Text

A. Use the Following Books for Discourse Analysis:

- Critical Discourse Analysis_ The Critical Study of Language.
- Discourse analysis.
- The Routledge handbook of discourse analysis.

6. Analysis of Genre.

A. Open Figure Of Speech Folder. Use the Following Books for Analysis of Genre :

- Literary Device.
- FIGURES OF SPEECH - Biblical Research Journal.
- Figures of Speech.

7. Analysis of Context

1. What is Immediate Context?
2. What is the Book Context?
3. What is the Whole Context?

11. Facts within The Context.

12. Do the Fact Checking. Checking Facts, If they are correct or incorrect.

A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.

- Fact Checking Process.
- Verification Handbook.
- The Data Journalism.
- Data Journalism - Centre for Investigative Journalism.
- Tutorial-computational-fact-checking-a-content-management-perspective.
- Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
- Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
- The Effect of Fact-checking on Elites.
- Why do journalists fact-check.
- Fact-checking 101.
- Sagan-Baloney.
- Fact Checking.

B. Research the Facts, figures and ideas and do fact checking, if these are true or false through:

- Wikipedia
- E-book
- Books about autobiography and Biography
- Websites
- University
- Books
- Audiobooks

- C. Do full fact checking of the facts the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- D. Do full fact checking of the figures the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- E. Do full fact checking of the statistics the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- F. Do full fact checking of the formulas the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- G. Do full fact checking of the mathematical results the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- H. Do full fact checking of the evidences the author provided.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?
- I. Any other information author provided do full fact checking.
 - Are The Facts Provided are Trustworthy?
 - Are the FACTS are True or Wrong?
 - Has the Author Did a Full Fact Checks on either side?

Do Checking The Sources of Each Fact Provided

- A. Use The Following Books To Do the Fact Checking
- B. Does the Author provided the list of sources citation?

13. Bias vs Unbiased

- A. Listen and read if the author is biased or unbiased.
- B. Is the author best representative for one or another side?
- C. Is the author bias or not? What is the author's bias and purpose?
- D. Does the speaker or writer have personal or professional interest in the information they are presenting?
- E. How a writer might purposely present ideas or events in ways that favour a particular political party/organisation/religion/social group?
- F. Does the author presents facts and explain the ideas to reader or listener?
- G. Is the author uses facts and opinions to argue for or against some idea?
- H. Is the author tries to amuse or interest the reader with humour, suspense, intense and stories?
- I. Look at the language in the passage?
 - If it is neutral and objective, the purpose is probably simply to inform the reader?
 - If is includes terms and are strongly positive, negative or emotional, the purpose is probably to persuade the reader?
 - It is include situations or descriptions that are funny, surprising or intriguing the writer, probably wants to entertain the reader?
- J. Is the author biased?
 - Is the author presenting only one side of an argument?
 - Is it include only facts and examples that support writer's opinion?
 - Is it using the language intended to influence the reader's emotions?
 - Is it ridicules other opinions or views?
- K. Does the author have contradictory information, cherry picked evidence or carefully select language in which to present information favourably?
- L. Is the author or speaker speaks/writes for company, special interest group, an institute foundation think tank or political party?
- M. Does the author/writer gets paid or provided any gift for endorsement or opinion?
- N. Does the person have interest on this topic or has any personal gain? If not then this writer/speaker is disinterested, impartial/unbiased objective.
- O. If the speaker/writer has interest, then why does she/he present the information/ data in such a way?
- P. In surveys or studies has the author worded the question in such a way to ensure the sought-after response?

- Q. Is the company paid the author to prove that the device or product is better than any other product in the market?
- R. Is the marketer or industry trying to defend the product? Did the author put the best spin on its information?
- S. When was the survey or studies or experiment done?
- T. What day were the tests, survey or experiment done?
- U. Purpose of the author writing?
- V. How did the author handle opposing views? Is the author trying to persuade the reader to some belief?
- W. Does the author fairly handle the opposing view? Or did the author dismiss opposing points without regard to their possible value?
- X. Does the writer make any straw man fallacy, misrepresenting opposing views to more easily knock them down?
- Y. Did the author use slanted language or commit personal attack?
- Z. Does the writer use sweeping generalisation or demonstrate an either/or approach to complicated issues, thereby revealing a strong bias toward one side?
- AA. Does the writer pretend to be objective?
- BB. Does the writer intend to be ironic or satirical, if she or he is clearly exaggerating for effect?
- CC. Does the writer admit to guesswork and speculation?

14. Checking Each Fact's Sources, If they Are Reliable or Unreliable. Sources the author used

- A. Open Fact Checking Folder. Use The Following Books to Do The Fact Checking.
- Fact Checking Process.
 - Verification Handbook.
 - The Data Journalism.
 - Data Journalism - Centre for Investigative Journalism.
 - Tutorial-computational-fact-checking-a-content-management-perspective.
 - Nato_stratcom_coe_fact-checking_and_debunking_02-02-2021-1.
 - Facts, Alternative Facts, and Fact Checking in Times of Post-Truth Politics.
 - The Effect of Fact-checking on Elites.
 - Why do journalists fact-check.
 - Fact-checking 101.
 - Sagan-Baloney.
 - Fact Checking.
- B. Listen or read what sources of information Author used
- C. What are the author's sources?
- Did the writer respond to those who have preceded them?
 - Has the writer depended on the primary/secondary/tertiary sources?
 - Has the writer misquoted the primary/secondary/tertiary or has he quoted the primary/secondary/tertiary source?
 - Has the writer uses statistics or data, has he used primary/secondary/tertiary source?
 - Has the writer interpreted the data or survey or statistics biased/unbiased?
 - Has the author correctly interpreted the information?
 - Has the author incorrectly interpreted information?
 - Search the very sources author uses and see if the author interpreted the information in correct way.
 - Has the author uses trust sources for the work he has written?

D. Is the Source Reliable or Unreliable?

E. Sources

- Is the author uses primary source in presenting some data or facts in his/her newspaper, article, book journal?
 1. Is the primary source reliable, fair, ethical and trustworthy?
 2. Is the primary source sloppy, biased, unethical?
 3. Is the primary source objective when they speaking about certain subject?
 4. Are the primary source present facts carefully or careless?
 5. Is the primary source truthfully presenting the facts, opinions and data?
 6. Who is the writer? Is he /she qualified expert to write about this topic?
 7. Did the write done proper research regarding the topic?
 8. What is the tone?
 9. What is the purpose of publication?
 10. What assumption does the author make?
 11. What are the bases of author's conclusions?
 12. Does the author agree or disagree with other authors on the subject?
 13. Was this written in regards of the counterargument other authors who have opposite views?
 14. Does the content agree or disagree with author/authors on the subject?
 15. Does the content agree or disagree with what you know or have learned about the issue?
 16. Where was the source made?
 17. Where is the material from? Is this a valid source of information?

F. Is the Source Reliable or Unreliable?

- What primary sources did the author use. This is the list of primary source:
 1. Data and original research.
 2. Diaries and journals.
 3. Letters and memos.
 4. Autobiographies and memoirs.
 5. Books or articles written at the time of event?
 6. Government documents.
 7. Census statistics.
 8. Organisational records.
 9. Documentaries.
 10. photographs, art (from the time period).
 11. Maps (from the period).
 12. Patents.
 13. Theses.
 14. Dissertations.
 15. Photographs.
 16. Journal articles.
 17. Newspaper articles.
 18. Survey research research.
 19. Meetings.
 20. Symposia.
 21. Original documents.
 22. Records of organisation.
 23. Internet.
 24. Email.
 25. Communication in listservs.
 26. Interviews.
 27. Video recordings.
 28. Audio recordings.
 29. Websites.
 30. Communication through social media.
 31. Artefacts.
 32. Reports.
 33. Works of art and architecture.
 34. Eyewitness.

- 35. Statistics.
- 36. Oral history.
- 37. Description of travel.
- 38. Cartoon.
- 39. Postcards.
- 40. Posters.
- 41. Internet communications.
- 42. Any above reprinted in the original format and language.

- Is the author use secondary source in presenting some data or facts in his/her newspaper, articles, book, magazine/, journal?
 1. Is the second hand source reliable, fair ethical and trustworthy?
 2. Is the second hand source being sloppy, biased, unethical in their quoting paraphrasing and summarising?
 3. Is the secondary source objectively when they are speaking about certain subject?
 4. Are the secondary source present facts carefully or careless?
 5. Is the secondary source truthfully presents the facts opinions/data?
 6. Is the secondary data was accepted blind faith or skeptically analysed by author?
 7. What secondary source did the author use? This is the list of secondary sources:
 - Encyclopedia
 - Chronologies
 - Biographies
 - Monographs
 - Most journal article
 - Literary criticism
 - Political analysis
 - Review of law and legislations
 - Essay on morals and ethics
 - Analyses of social policy
 - Study and teaching material
 - Literature reviews
 - Research articles
 - Criticism of works of literature, art and music
 - Most published books
 - Abstract of articles
 - Paraphrased quotation
 - Dictionaries
 - Textbooks
 - Commentaries
 - Magazines and newspaper articles
 - Website

8. Is the Source Reliable or Unreliable?

- Is the author use tertiary source in presenting some data or facts in her newspaper, articles, book journal or magazine
 1. Is the tertiary hand source reliable, fair, ethical and trustworthy?
 2. Is the tertiary hand source being sloppy, biased, unethical in their quoting, paraphrasing and summarising.
 3. Is the tertiary source objectively when they are speaking about certain subject?
 4. Are the tertiary source present facts carefully or careless?
 5. Is the tertiary source truthfully presents the facts opinions/data?
 6. Is the tertiary data was accepted blind faith or skeptically analysed by author?
 7. What tertiary source did the author use? List:
 - Almanacs
 - Bibliographies
 - Classification
 - Population registers
 - Chronologies
 - Dictionaries
 - Encyclopedias
 - Directories
 - Fact books
 - Guidebooks
 - Indexes
 - Abstract sources
 - Manuals textbooks

 8. Is the Source Reliable or Unreliable?

14. Rhetorical Analysis Of The Text

A. Open Rhetorical Analysis Folder. Use The Following Books For Rhetorical Analysis of The Book:

- Rhetoric By Aristotle.
- A Companion to Rhetoric and Rhetorical Criticism.
- Ancient Rhetoric From Aristotle to Philostratus.
- Ancient Rhetoric For Contemporary Students by Sharon Crowley.
- Art Of Rhetoric By Aristotle.
- Conversations In American Literature: Language, Rhetoric, Culture By Robin Aufses.
- Encyclopaedia of Rhetoric.
- On Rhetoric: Theory of Civic Discourse by Aristotle.
- Politics and Rhetoric: The Persuasive Power of Metaphor.
- Rhetoric By Jennifer Richards.
- Rhetoric In Details By John Benjamins.
- Rhetorical Grammar By Martha Kolln.
- Sourcebook on Rhetoric By James Jasinski.
- The Language of Composition: Reading, Writing, Rhetoric by Renee Shea.
- The Longman Writer_ Rhetoric, Reader, Research Guide, and Handbook.
- The Rhetoric of Reason By James Crosswhite.
- Trivium- Liberal Arts of Logic, Grammar and Rhetoric By Sister Mirriam Joseph.
- Writing Arguments: a RHETORIC With Reading by John Ramage.

B. Follow Every step of the Book, I have chose to do Rhetorical Analysis.

15. Take notes on literature.

16. By reading, you will identify certain questions within the area of research.

17. Master the literature in the area of research.

18. Use Rules of Writing.

*PART 6: Analysis Of Book By
Using External Sources.*

Step 40-Aids To Reading, Listening, Conversation, Debate

Any aid to reading that lies outside the book being read we may speak of as extrinsic. By “intrinsic reading” we mean reading a book in itself, quite apart from all other books. By “extrinsic reading” we mean reading a book in the light of other books. So far we have intentionally avoided mentioning any extrinsic aids to reading. The rules of reading we have set forth are rules of intrinsic reading—they do not include going outside the book to discover what it means. There are good reasons for our having insisted up to now on your primary task as a reader—taking the book into your study and working on it by yourself, with the power of your own mind, and with no other aids. But it would be wrong to continue insisting on this. Extrinsic aids can help. And sometimes they are necessary for full understanding.

One reason why we have said nothing about extrinsic reading up to now is that intrinsic and extrinsic reading tend to fuse in the actual process of understanding and criticising a book. We really cannot help bringing our experience to bear on the tasks of interpretation and criticism and even outlining. We must have read other books before this one; no one starts his reading career by reading analytically. We may not bring to bear our experience both of other books and of life as systematically as we should, but we nevertheless measure the statements and conclusions of a writer against other things that we know, from many different sources. Thus it is common sense to say that no book should be, because no book can be, read entirely and completely in isolation.

But the main reason for avoiding extrinsic aids up to this point is that many readers depend on them too slavishly, and we wanted you to realize that this is unnecessary. Reading a book with a dictionary in the other hand is a bad idea, although this does not mean you should never go to a dictionary for the meanings of words that are strange to you. And seeking the meaning of a book that puzzles you in a commentary is often ill-advised. On the whole, it is best to do all that you can by yourself before seeking outside help; for if you act consistently on this principle, you will find that you need less and less outside help.

The extrinsic aids to reading fall into four categories. In the order in which we will discuss them in this chapter, they are: first, relevant experiences; second, other books; third, commentaries and abstracts; fourth, reference books.

How and when to use any of these types of extrinsic aids cannot be stated for every particular case. Some general suggestions can be made, however. It is a common-sense maxim of reading that outside help should be sought whenever a book remains unintelligible to you, either in whole or part, *after you have done your best to read it according to the rules of intrinsic reading.*

The Role of Relevant Experience

There are two types of relevant experience that may be referred to for help in understanding difficult books. We have already mentioned the distinction involved, when we spoke in Chapter 6 of the difference between common experience and special experience. Common experience is available to all men and women just because they are alive. Special experience must be actively sought and is available only to those who go to the trouble of acquiring it. The best example of special experience is an experiment in a laboratory, but a laboratory is not always required. An anthropologist may acquire special experience by traveling to the Amazon basin, for example, to study the aboriginal inhabitants of a region that has not yet been explored. He thereby gains experience that is not ordinarily available to others, and that will never be available to many; for if large numbers of scientists invade the region, it will cease to be unique. Similarly, the experience of the astronauts on the moon is highly special, although the moon is not a laboratory in the ordinary sense of the term. Most men do not have the opportunity of knowing what it is like to live on an airless planet, and it will be centuries before this becomes a common experience, if it ever does. Jupiter, too, with its enormously greater gravity, will remain a "laboratory" in this sense for a long time to come, and may always be such.

Common experience does not have to be shared by everyone in order to be common. *Common* is not the same as *universal*. The experience of being a child of parents, for example, is not shared by every human being, for some are orphans from birth. However, family life is nevertheless common experience, because most men and women, in the ordinary course of their lives, share it. Nor is sexual love a universal experience, although it is common, in the sense we are giving the word *common*. Some men and women never experience it, but the experience is shared by such a high proportion of humans that it cannot be called special. (This does not mean that sexual activity cannot be studied in the laboratory, as in fact it has been.) The experience of being taught is not universal, either, for some men and women never go to school. But it, too, is common.

The two kinds of experience are mainly relevant to different kinds of books. Common experience is most relevant to the reading of fiction, on the one hand, and to the reading of philosophy, on the other. Judgments concerning the verisimilitude of a novel are almost wholly based on common experience; the book, we say, is either true or not true to our experience of life as it is led by most people, ourselves included. The philosopher, like the poet, appeals to the common experience of mankind. He does no work in laboratories or research in the field. Hence to understand and test a philosopher's leading principles you do not need the extrinsic aid of special experience. He refers you to your own common sense and your daily observation of the world in which you live.

Special experience is mainly relevant to the reading of scientific works. To understand and judge the inductive arguments in a scientific book, you must be able to follow the evidence that the scientist reports as their basis. Sometimes the scientist's description of an experiment is so vivid and clear that you have no trouble. Sometimes illustrations and diagrams help to acquaint you with the phenomena described.

Both common and special experience are relevant to the reading of history books. This is because history partakes both of the fictional and the scientific. On the one hand, a narrative history is a story, having a plot and characters, episodes, complications of action, a climax, an aftermath. The common experience that is relevant to reading novels and plays is relevant here, too. But history is also like science, in the sense that at least some of the experience on which the historian bases his work is quite special. He may have read a document or many documents that the reader could not manage to see without great trouble. He may have done extensive research, either into the remains of past civilizations or in the form of interviews with living persons in faraway places.

How do you know whether you are making proper use of your experience to help you understand a book? The surest test is one we have already recommended as a test of understanding: ask yourself whether you can give a concrete example of a point that you feel you understand. We have many times asked students to do this, only to find that they could not. The students appeared to have understood the point, but they were completely at a loss when called upon to supply an example. Obviously, they had not really understood the book. Test yourself in this way when you are not quite sure whether you have grasped a book. Take Aristotle's discussion of virtue in the *Ethics*, for example. He says over and over that virtue is a mean between the extremes of defect and excess. He gives some concrete examples; can you supply others? If so, you have understood his general point. If not, you should go back and read his discussion again.

Other Books as Extrinsic Aids to Reading

We will have more to say later about syntopical reading, where more than one book is read on a single subject. For the moment, we want to say a few things about the desirability of reading other books as extrinsic aids to the reading of a particular work.

Our advice applies particularly to the reading of so-called great books. The enthusiasm with which people embark on a course of reading great books often gives way, fairly soon, to a feeling of hopeless inadequacy. One reason, of course, is that many readers do not know how to read a single book very well. But that is not all. There is another reason: namely, that they think they should be able to understand the first book they pick up, without having read the others to which it is closely related. They may try to read *The Federalist Papers* without having first read the Articles of Confederation and the Constitution. Or they may try all these without having read Montesquieu's *The Spirit of Laws*, Rousseau's *The Social Contract*, and Locke's second treatise *Of Civil Government*.

Not only are many of the great books related, but also they were written in a certain order that should not be ignored. A later writer has been influenced by an earlier one. If you read the earlier writer first, he may help you to understand the later one. Reading related books in relation to one another and in an order that renders the later ones more intelligible is a basic common-sense maxim of extrinsic reading.

The utility of this kind of extrinsic reading is simply an extension of the value of context in reading a book by itself. We have seen how the context must be used to interpret words and sentences to find terms and propositions. Just as the whole book is the context for any of its parts, so related books provide an even larger context that helps you interpret the book you are reading.

It has often been observed that the great books are involved in a prolonged conversation. The great authors were great readers, and one way to understand them is to read the books they read. As readers, they carried on a conversation with other authors, just as each of us carries on a conversation with the books we read, though we may not write other books.

To join this conversation, we must read the great books in relation to one another, and in an order that somehow respects chronology. The conversation of the books takes place in time. Time is of the essence here and should not be disregarded. The books can be read from the present into the past or from the past into the present. Though the order from past to present has certain advantages through being more natural, the fact of chronology can be observed in either way.

It should be noted, incidentally, that the need to read books in relation to one another applies more to history and philosophy than to science and fiction. It is most important in the case of philosophy, because philosophers are great readers of each other. It is probably least important in the case of novels or plays, which, if they are really good, can be read in isolation, although of course the literary critic will not want to confine himself to doing so.

How to Use Commentaries and Abstracts

A third category of extrinsic aids to reading includes commentaries and abstracts. The thing to emphasize here is that such works should be used wisely, which is to say sparingly. There are two reasons for this.

The first is that commentators are not always right in their comments on a book. Sometimes, of course, their works are enormously useful, but this is true less often than one could wish. The handbooks and manuals that are widely available in college bookstores and in stores frequented by high school students are often particularly misleading. These works purport to tell the student everything he has to know about a book that has been assigned by one of his teachers, but they are sometimes woefully wrong in their interpretations, and besides, as a practical matter, they irritate some teachers and professors.

In defense of handbooks, it must be conceded that they are often invaluable for passing examinations. Furthermore, to balance the fact that some teachers are irritated by the errors of handbooks, other teachers use them themselves in their teaching.

The second reason for using commentaries sparingly is that, even if they are right, they may not be exhaustive. That is, you may be able to discover important meanings in a book that the author of a commentary about it has not discovered. Reading a commentary, particularly one that seems very self-assured, thus tends to limit your understanding of a book, even if your understanding, as far as it goes, is correct.

Hence, there is one piece of advice that we want to give you about using commentaries. Indeed, this comes close to being a basic maxim of extrinsic reading. Whereas it is one of the rules of intrinsic reading that you should read an author's preface and introduction *before* reading his book, the rule in the case of extrinsic reading is that you should not read a commentary by someone else until *after* you have read the book. This applies particularly to scholarly and critical introductions. They are properly used only if you do your best to read the book first, and then and only then apply to them for answers to questions that still puzzle you. If you read them first they are likely to distort your reading of the book. You will tend to see only the points made by the scholar or critic, and fail to see other points that may be just as important.

There is considerable pleasure associated with the reading of such introductions when it is done in this way. You have read the book and understood it. The writer of the introduction has also read it, perhaps many times, and has his own understanding of it. You approach him, therefore, on essentially equal terms. If you read his introduction before reading the book, however, you are at his mercy.

Heeding this rule, that commentaries should be read after you have read the book that they expound and not before, applies also to handbooks. Such works cannot hurt you if you have already read the book and know where the handbook is wrong, if it is. But if you depend wholly on the handbook, and never read the original book, you may be in bad trouble.

And there is this further point. If you get into the habit of depending on commentaries and handbooks, you will be totally lost if you cannot find one. You may be able to understand a particular book with the help of a commentary, but in general you will be a worse reader.

The rule of extrinsic reading given here applies also to abstracts and plot digests. They are useful in two connections, but in those two only. First, they can help to jog your memory of a book's contents, if you have already read it. Ideally, you made such an abstract yourself, in reading the book analytically, but if you have not done so, an abstract or digest can be an important aid. Second, abstracts are useful when you are engaged in syntopical reading, and wish to know whether a certain work is likely to be germane to your project. An abstract can never replace the reading of a book, but it can sometimes tell you whether you want or need to read the book or not.

How to Use Reference Books

There are many kinds of reference books. In the following section we will confine ourselves mainly to the two most used kinds, dictionaries and encyclopedias.

However, many of the things we will have to say apply to other kinds of reference books as well.

It is not always realized, yet it is nevertheless true, that a good deal of knowledge is required before you can use a reference book well. Specifically, four kinds of knowledge are required. Thus a reference book is an antidote to ignorance in only a limited way. It cannot cure total ignorance. It cannot do your thinking for you.

To use a reference book well, you must, *first*, have some idea, however vague it may be, of what you want to know. Your ignorance must be like a circle of darkness surrounded by light. You want to bring light to the dark circle. You cannot do that unless light surrounds the darkness. Another way to say this is that you must be able to ask a reference book an intelligible question. It will be no help to you if you are wandering, lost, in a fog of ignorance.

Second, you must know where to find out what you want to know. You must know what kind of question you are asking, and which kinds of reference books answer that kind of question. There is no reference book that answers all questions; all such works are specialists, as it were. Practically, this comes down to the fact that you must have a fair overall knowledge of *all* of the major types of reference books before you can use *any one* type effectively.

There is a *third*, and correlative, kind of knowledge that is required before a reference book can be useful to you. You must know how the particular work is organized. It will do you no good to know what you want to know, and to know the kind of reference book to use, if you do not know how to use the particular work. Thus there is an art of reading reference books, just as there is an art to reading anything else. There is a correlative art to making reference books, by the way. The author or compiler should know what kind of information readers will seek, and arrange his book to fit their needs. He may not always be able to anticipate these, however, which is why the rule that you should read the introduction and preface to a book before reading the book itself applies particularly here. Do not try to use a reference book before getting the editor's advice on *how* to use it.

Of course, not all kinds of questions can be answered by reference books. You will not find in any reference book the answers to the three questions that God asks the angel in Tolstoy's story, *What Men Live By*—namely, "What dwells in man?" "What is not given to man?" and "What do men live by?" Nor will you find the answers to another question that is also used as the title of a Tolstoy story: "How much land does a man need?" And there are many such questions. Reference books are only useful when you know which kinds of questions can be answered by them, and which cannot. This comes down to knowing the

sorts of things that men generally agree on. Only those things about which men generally and conventionally agree are to be found in reference books. Unsupported opinions have no business there, though they sometimes creep in.

We agree that it is possible to know when a man was born, when he died, and facts about similar matters. We agree that it is possible to define words and things, and that it is possible to sketch the history of almost anything. We do not agree on moral questions or on questions about the future, and so these sorts of things are not to be found in reference books. We assume in our time that the physical world is orderable, and thus almost everything about it is to be found in reference books. This was not always so; as a result, the history of reference books is interesting in itself, for it can tell us much about changes in men's opinions as to what is knowable.

As you can see, we have just been suggesting that there is a *fourth* requirement for the intelligent use of reference books. You must know *what* you want to know; you must know *in what reference work* to find it; you must know *how* to find it in the reference work; and you must know that it is *considered knowable* by the authors or compilers of the book. All this indicates that you must know a good deal before you can use a work of reference. Reference books are useless to people who know nothing. They are not guides to the perplexed.

How to Use a Dictionary

As a reference book, the dictionary is subject to all the considerations outlined above. But the dictionary also invites a playful reading. It challenges anyone to sit down with it in an idle moment. There are worse ways to kill time.

Dictionaries are full of arcane knowledge and witty oddments. Over and above that, of course, they have their more sober employments. To make the most of these, one has to know how to read the special kind of book a dictionary is.

Santayana's remark about the Greeks—that they were the only uneducated people in European history—has a double significance. The masses were, of course, uneducated, but even the learned few—the leisure class—were not educated in the sense that they had to sit at the feet of foreign masters. Education, in that sense, begins with the Romans, who went to school to Greek pedagogues, and became cultivated through contact with the Greek culture they had conquered.

It is not surprising, therefore, that the first dictionaries were glossaries of Homeric words, intended to help Romans read the *Iliad* and *Odyssey* as well as other Greek literature employing the “archaic” Homeric vocabulary. In the same way, many of us today need a glossary to read Shakespeare, or if not Shakespeare, Chaucer.

There were dictionaries in the Middle Ages, but they were usually encyclopedias of worldly knowledge comprised of discussions of the most important technical terms employed in learned discourse. There were foreign-language dictionaries in the Renaissance (both Greek and Latin), made necessary by the fact that the works that dominated the education of the period were in the ancient languages. Even when the so-called vulgar tongues—Italian, French, English—gradually replaced Latin as the language of learning, the pursuit of learning was still the privilege of the few. Under such circumstances, dictionaries were intended for a limited audience, mainly as an aid to reading and writing worthy literature.

Thus we see that from the beginning the educational motive dominated the making of dictionaries, although there was also an interest in preserving the purity and order of the language. As contrasted with the latter purpose, the *Oxford English Dictionary* (known familiarly as the OED), begun in 1857, was a new departure, in that it did not try to dictate usage but instead to present an accurate historical record of every type of usage—the worst as well as the best, taken from popular as well as elegant writing. But this conflict between the lexicographer as self-appointed arbiter and the lexicographer as historian can be regarded as a side-issue, for the dictionary, however constructed, is primarily an educational instrument.

This fact is relevant to the rules for using a dictionary well, as an extrinsic aid to reading. The first rule of reading any book is to know what kind of book it is. That means knowing what the author's intention was and what sort of thing you can expect to find in his work. If you look upon a dictionary merely as a spelling book or guide to pronunciation, you

will use it accordingly, which is to say not well. If you realize that it contains a wealth of historical information, crystallized in the growth and development of language, you will pay attention, not merely to the variety of meanings listed under each word, but also to their order and relation.

Above all, if you are interested in advancing your own education, you will use a dictionary according to its primary intention—as a help in reading books that might otherwise be too difficult because their vocabulary includes technical words, archaic words, literary allusions, or even familiar words used in obsolete senses.

Of course, there are many problems to be solved in reading a book well other than those arising from an author's vocabulary. And we have warned against—particularly on the first reading of a difficult book—sitting with the book in one hand and the dictionary in the other. If you have to look up too many words at the beginning, you will certainly lose track of the book's unity and order. The dictionary's primary service is on those occasions when you are confronted with a technical word or with a word that is wholly new to you. Even then, we would not recommend looking up even these during your first reading of a good book unless they seem to be important to the author's general meaning.

This suggests several other negative injunctions. There is no more irritating fellow than the one who tries to settle an argument about communism, or justice, or freedom, by quoting from the dictionary. Lexicographers may be respected as authorities on word usage, but they are not the ultimate founts of wisdom. Another negative rule is: Don't swallow the dictionary. Don't try to get word-rich quick by memorizing a fancy list of words whose meanings are unconnected with any actual experience. In short, do not forget that the dictionary is a book about words, not about things.

If we remember this, we can derive from that fact all the rules for using a dictionary intelligently. Words can be looked at in four ways.

- 1. WORDS ARE PHYSICAL THINGS—writable words and speakable sounds.** There must, therefore, be uniform ways of spelling and pronouncing them, though the uniformity is often spoiled by variations, and in any event is not as eternally important as some of your teachers may have indicated.
- 2. WORDS ARE PARTS OF SPEECH.** Each single word plays a grammatical role in the more complicated structure of a phrase or sentence. The same word can vary in different usages, shifting from one part of speech to another, especially in a non-inflected language like English.
- 3. WORDS ARE SIGNS.** They have meanings, not one but many. These meanings are related in various ways. Sometimes they shade from one into another; sometimes a word will have two or more sets of totally unrelated meanings. Through their meanings, different words are related to one another—as synonyms sharing in the same meaning even though they differ in shading; or

as antonyms through opposition or contrast of meanings. Furthermore, it is in their capacity as signs that we distinguish words as proper or common names (according as they name just one thing or many that are alike in some respect); and as concrete or abstract names (according as they point to something we can sense, or refer to some aspect of things that we can understand by thought but not observe through our senses).

Finally, 4. **WORDS ARE CONVENTIONAL.** They are man-made signs. That is why every word has a history, a cultural career in the course of which it goes through certain transformations. The history of words is given by their etymological derivation from original word-roots, prefixes, and suffixes; it includes the account of their physical changes, both in spelling and pronunciation; it tells of the shifting meanings, and which among them are archaic and obsolete, which are current and regular, which are idiomatic, colloquial, or slang.

A good dictionary will answer all of these four different kinds of questions about words. The art of using a dictionary consists in knowing what questions to ask about words and how to find the answers. We have suggested the questions. The dictionary itself tells you how to find the answers.

As such, it is a perfect self-help book, because it tells you what to pay attention to and how to interpret the various abbreviations and symbols it uses in giving you the four varieties of information about words. Anyone who fails to consult the explanatory notes and the list of abbreviations at the beginning of a dictionary has only himself to blame if he is not able to use it well.

How to Use an Encyclopedia

Many of the things we have said about dictionaries apply to encyclopedias also. Like the dictionary, the encyclopedia invites a playful reading. It too is diverting, entertaining, and, for some people, soothing. But it is just as vain to try to read an encyclopedia through as a dictionary. The man who knew an encyclopedia by heart would be in grave danger of incurring the title *idiot savant*—"learned fool."

Many people use a dictionary to find out how to spell and pronounce words. The analogous employment of an encyclopedia is to use it only to look up dates and places and other such simple facts. But this is to under-use, or misuse, an encyclopedia. Like dictionaries, such works are educational as well as informational tools. A glance at their history will confirm this.

Though the word "encyclopedia" is Greek, the Greeks had no encyclopedia, and for the same reason that they had no dictionary. The word meant to them not a book about knowledge, a book in which knowledge reposed, but knowledge itself— all the knowledge that an educated man should have. It was again the Romans who first found encyclopedias necessary; the oldest extant example is that of Pliny.

Interestingly enough, the first alphabetically-arranged encyclopedia did not appear until about 1700. Most of the great encyclopedias since then have been alphabetical. It is the easiest of all arrangements, and it made possible great strides in encyclopedia-making.

Encyclopedias present a different problem from word-books. An alphabetical arrangement is natural for a dictionary. But is the world, which is the subject matter of an encyclopedia, arranged alphabetically? Obviously not. Well then, how is the world arranged and ordered? This comes down to asking how knowledge is ordered.

The ordering of knowledge has changed with the centuries. All knowledge was once ordered in relation to the seven liberal arts—grammar, rhetoric, and logic, the trivium; arithmetic, geometry, astronomy, and music, the quadrivium. Medieval encyclopedias reflected this arrangement. Since the universities were arranged according to the same system, and students studied according to it also, the arrangement was useful in education.

The modern university is very different from the medieval one, and the change is reflected in modern encyclopedias. The knowledge that they report is divided up in fiefs, or specialties, that are roughly equivalent to the various departments of the university. But this arrangement, although it forms the backbone structure of an encyclopedia, is masked by the alphabetical arrangement of the material.

It is this infra-structure—to take a term from the sociologists—that the good reader and user of an encyclopedia will seek to discover. It is true that it is primarily factual information that he wants from his set. But he should not be content with facts in isolation.

The encyclopedia presents him with an arrangement of facts— facts in relation to other facts. The understanding, as contrasted with the mere information, that an encyclopedia can provide depends on the recognition of such relations.

In an alphabetically-arranged encyclopedia, these relations are to a large extent obscured. In a topically-arranged encyclopedia, they are, of course, highlighted. But topical encyclopedias have many disadvantages, among them the fact that most readers are not accustomed to using them. Ideally, the best encyclopedia would be one that had both a topical and an alphabetical arrangement. Its presentation of material in the form of separate articles would be alphabetical, but it would also contain some kind of topical key or outline—essentially, a table of contents. (A table of contents is a topical arrangement of a book, as opposed to an index, which is an alphabetical arrangement.) As far as we know, there is no such encyclopedia on the market today, but it would be worth the effort to try to make one.

In default of the ideal, the reader must fall back on the help and advice provided him by an encyclopedia's editors. Any good encyclopedia includes directions about how to use it effectively, and these should be read and followed. Often, these directions require that the user go first to the set's index, before turning to one of the alphabetically-arranged volumes. Here, the index is serving the function of a table of contents, though not very well; for it gathers together, under one heading, references to discussions in the encyclopedia that may be widely separated in space but that are nevertheless about the same general subject. This reflects the fact that although an index is of course alphabetically arranged, its so-called analyticals—that is, the breakdowns under a main entry—are topically arranged. But the topics themselves must be in alphabetical order, which is not necessarily the best arrangement. Thus the index of a really good encyclopedia such as Britannica goes part of the way toward revealing the arrangement of knowledge that the work reflects. For this reason, any reader who fails to use the index has only himself to blame if the work does not serve his needs.

There are negative injunctions associated with the use of encyclopedias, just as there are for dictionaries. Encyclopedias, like dictionaries, are valuable adjuncts to the reading of good books—bad books do not ordinarily require their presence; but, as before, it is wise not to enslave yourself to an encyclopedia. Again, as with dictionaries, encyclopedias are not to be used for the settling of arguments where these are based on differences of opinion. Nevertheless, they *should* be used to end disputes about matters of fact as quickly and permanently as possible. Facts should never be argued about in the first place. An encyclopedia makes this vain effort unnecessary, because encyclopedias are full of facts. Ideally, they are filled with nothing else. Finally, although dictionaries usually agree in their accounts of words, encyclopedias often do not agree in their accounts of facts. Hence, if you are really interested in a subject and are depending on encyclopedic treatments of it, do not restrict yourself to just one encyclopedia. Read more than one, and preferably ones written at different times.

We noted several points about words that the user should keep in mind when he consults a dictionary. In the case of encyclopedias, the analogous points are about facts, for an encyclopedia is about facts as a dictionary is about words.

1. **FACTS ARE PROPOSITIONS.** Statements of fact employ words in combination, such as “Abraham Lincoln was born on February 12, 1809,” or “the atomic number of gold is 79.” Facts are not physical things, as words are, but they do require to be explained. For thorough knowledge, for understanding, you must also know what the significance of a fact is—how it affects the truth you are seeking. You do not know much if all you know is what the fact is.
2. **FACTS ARE “TRUE” PROPOSITIONS.** Facts are not opinions. When someone says “it is a fact that,” he means that it is generally agreed that such is the case. He never means, or never should mean, that he alone, or he together with a minority of observers, believes such and such to be the case. It is this characteristic of facts that gives the encyclopedia its tone and style. An encyclopedia that contains the unsupported opinions of its editors is dishonest; and although an encyclopedia may report opinions (for example, in a phrase like “it is held by some that this is the case, by others that that is the case”), it must clearly label them. The requirement that an encyclopedia report the facts of the case and not opinions about it (except as noted above) also limits the work’s coverage. It cannot properly deal with matters about which there is no consensus—with moral questions, for example. If it does deal with such questions, it can only properly report the disagreements among men about them.
3. **FACTS ARE REFLECTIONS OF REALITY.** Facts may be either (a) informational singulars or (b) relatively unquestioned generalizations, but in either case they are held to represent the way things really are. (The birth date of Lincoln is an informational singular; the atomic number of gold implies a relatively unquestioned generalization about matter.) Thus facts are not ideas or concepts, nor are they theories in the sense of being mere speculations about reality. Similarly, an explanation of reality (or of part of it) is not a fact until and unless there is general agreement that it is correct.

There is one exception to the last statement. An encyclopedia can properly describe a theory that is no longer held to be correct, in whole or in part, or one that has not yet been fully validated, when it is associated with a topic, person or school that is the subject of an article. Thus, for example, Aristotle’s views on the nature of celestial matter could be expounded in an article on Aristoteleanism even though we no longer believe them to be true.

Finally, 4. **FACTS ARE TO SOME EXTENT CONVENTIONAL.** Facts change, we say. We mean that some propositions that are considered to be facts in one epoch are no longer considered to be facts in another. Insofar as facts are “true” and represent reality, they cannot change, of course, because truth, strictly speaking, does not change, nor does reality. But not all propositions that we take to be true are really true; and we must concede that almost any given proposition that we take to be true can be falsified by more patient or more accurate observation and investigation. This applies particularly to the facts of science.

Facts are also—again to some extent—culturally determined. An atomic scientist, for example, maintains a complicated, hypothetical structure of reality in his mind that determines—for him—certain facts that are different from the facts that are determined for and accepted by a primitive. This does not mean that the scientist and the primitive cannot agree on any facts; they must agree, for instance, that two plus two is four, or that a physical whole is greater than any of its parts. But the primitive may not agree with the scientist’s facts about nuclear particles, just as the scientist may not agree with the primitive’s facts about ritual magic. (That was a hard sentence to write, because, being culturally determined ourselves, we tend to agree with the scientist rather than the primitive and were thus tempted to put the second “fact” in quotation marks. But that is precisely the point.)

A good encyclopedia will answer your questions about facts if you remember the points about facts that we have outlined above. The art of using an encyclopedia as an aid to reading is the art of asking the proper questions about facts. As with the dictionary, we have merely suggested the questions; the encyclopedia will supply the answers.

You should also remember that an encyclopedia is not the best place to pursue understanding. Insights may be gained from it about the order and arrangement of knowledge; but that, although an important subject, is nonetheless a limited one. There are many matters required for understanding that you will not find in an encyclopedia.

There are two particularly striking omissions. An encyclopedia, properly speaking, contains no arguments, except insofar as it reports the course of arguments that are now widely accepted as correct or at least as of historical interest. Thus a major element in expository writing is lacking. An encyclopedia also contains no poetry or imaginative literature, although it may contain facts about poetry and poets. Since both the imagination and the reason are required for understanding, this means that the encyclopedia must be a relatively unsatisfying tool in the pursuit of it.

Step 41-Commentaries On Book and What Are Other's Take on?

1. Rule 1-Use Commentaries

A. Read or listen 25min and 5min break

- Read or Listen 20 pages an Hour according Mortimer Adler.

B. Read or Listen following Tools to Use Commentaries on Books.

1. Folder Commentaries on the Book.
2. Speed of Tool Books:Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed to Find Commentaries on Books.

C. Speed of Audiobook.

- Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed to **Use Commentaries.**

1. Rule 2-What are other take on this book

D. Read or listen 25min and 5min break

- Read or Listen 20 pages an Hour according Mortimer Adler

E. Read or Listen following.

1. Books, Sermon, Journals, Newspaper, Academic Text.
2. Speed of Tool Books:Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed to Find What are other takes on this Book.

F. Speed of Audiobook.

- Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed.

Step 42 - Review Of The Book

A. Read or listen 25min and 5min break

- Read or Listen 20 pages an Hour according Mortimer Adler

B. Read or Listen between 1-50 times the book

C. Speed of Audiobook

- Analysing audiobook listen between 75 words per minute to 285 words per minute or listen between 0.5-1.9 times speed

D. What is the: title, author, publisher, date, length, and ISBN

E. Highlight any notable aspects, good or bad, of the book's design and production. Consider aesthetics, typography, cover, design, images, table of contents, notes, references, index.

F. What qualifies the author to write this book?

G. Does the book deliver on its promise? (What does it promise? What does it deliver? Cite evidence.)

H. What is the Style (casual, formal, light, humours, serious, scholarly . . .), point of view

I. What audience am I writing for? Consider where your review will be published. Who will be reading it, and what will they want to know about a book before buying it? Put yourself in the perspective of the intended audience, even if you are not a part of it.

J. Who is the audience? (i.e. age, reading level, interests, specialties...)

K. What genres/sub-genres does this fit into? Define the primary genre, then find elements of other sub-genres that may not have been immediately identifiable.

L. For nonfiction books what is your assessment of the quality of the argument, evidence, and exposition?

- Is the book intellectually honest?

M. What, if anything, is the original contribution this book makes?

N. What did you learn? What insights did you gain? Does the book make a unique contribution to knowledge or wisdom? Does it provide a new and better way to present difficult material?

O. What surprised you? Did you ever have an **ah-ha moment** while reading the book?

P. Was it easy or difficult to read? Fun and rewarding to read?

Q. For a fiction book, consider: Did you get lost in the book? What are the salient **plot points**? Did the book achieve emotional entrainment? Was the character development intriguing? Did you care about the characters?

- R. Which part attracts you most? Which ones were boring? Which chapter is the key-point of the story? Which portions did you like most? Why?
- S. Does The Book, Text, Debate, Discussion, Speech tries to use Sneaky technique to take away the audience's attention from something more important at that time?
- T. Does The Book, Text, Debate, Discussion, Speech tries to use Sneaky technique to take away the audience's attention from something more important?
- U. Does The author, Writer, Speaker tries to use Sneaky technique to take away the audience's attention from something more important?
- V. What is your favourite quote from the book? Why?
- W. What creative value does this book contribute?
- X. How does this book affect you on the whole? How does the author achieve this?
- Y. How does each role affect the story?
- Z. What is missing?
- AA. Does the book sparkle? A book that sparkles is fun to read, breaks new ground, communicates in memorable ways, uses images effectively, is accessible to a broad audience, and influences a significant readership to change their assumptions, beliefs, or ways of thinking.
- BB. Judge the book. Is it good or bad? Why?
- CC. Who are your target readers for your review? Are you writing this review to serve someone? Is your review outstanding among all the reviews of this book?
- DD. What, if anything, makes this an important work? What does the reader stand to gain by reading this book?
- EE. Book Style
- Reading level, vocabulary, sentence length.
 - **Point of view** (omniscient narrator, first person, . . .)
 - Serious, satire, humorous, academic, pedantic, frivolous
 - Comforting, call to action, alarming, disturbing,
- FF. Was I confused at any point while reading? If the writing was unclear, note this. If you didn't understand it, other readers probably won't either.
- GG. Did I care about the characters? If the characters weren't compelling in the slightest, the story likely fell flat. If you noticed this, include it in your review. (This is primarily a consideration in fiction and memoir.)
- HH. Did it have a compelling plot? Without a compelling plot, any work involving a storyline will lose the reader's attention. If you got bored, make it clear in your review.

- II. Was the dialogue believable? If it was difficult to believe anyone would talk like the characters in the book, the characters themselves were probably difficult to imagine.
- JJ. Were the events believable? At its core, a book (unless purely informational) is a story. If a story fails to be credible, the book cannot succeed at being a book.
- KK. Did any quotes strike me? Was anything said that you found interesting, thought-provoking, or tear-jerking? Note these strong moments in your review! (If this quote spoils a surprise moment in the book, include a warning at the beginning of your review.)
- LL. Was there any information I thought to be inaccurate? Credibility is important in any genre. If one piece of false information is presented, readers will lose trust in the entire book.
- MM. Are the illustrations engaging? If it includes illustrations, note if they are eye-catching or bland. Pay special attention to this if you are reviewing a children's book.
- NN. Is there any questionable/profane/graphic content? Many readers want to be aware of this kind of content before picking up a book. Even if it doesn't bother you, note anything that may be questionable to other readers.
- OO. What is the author's voice like? Describe how the author approaches the reader. Is the tone comedic, conversational, professional, or aloof?
- PP. **Tone** is the feeling that a book evokes in the reader. In many cases, this category best answers the question, "What are you in the mood for?" A more extensive list of tone descriptors and a brief definition of each is available in the above reference.
- Humorous, solemn, distant, intimate, ironic, arrogant, condescending, authoritative, scholarly, sentimental, angry, melancholy, anguished, youthful, optimistic, deadpan, satirical, maudlin, self-righteous, and so on.
- QQ. What is the author's purpose? Consider why this book was written and what the author intends to convey to the audience.
- RR. Book Semantics
- Credible, speculative, innovative, drivel, ...
 - Informative, argumentative, entertaining, ...
 - Well organised, well argued, excellent supporting evidence,
 - Muddled logic, rambling
 - Coherence, consistency, flow.
- SS. Is the author's purpose accomplished? Now consider how the answer above came across. Was it clear, or did you have to "dig" for it?

- TT. What are the author's credentials? What makes this author the only person who could write this book? Do they have a certain education or experience that makes them unique?
- UU. Is there an index or bibliography? This extra material, though not necessary, is good to know about before picking up the book.
- VV. What other books are similar to this one? What other titles have the same style as this one? Compare it to other books to give your audience a better idea of what it is like.
- WW. What did I learn while reading? Did this book make you think more deeply about any academic or moral topics?
- XX. Who would I recommend this book to? What specific audience would enjoy this book? Is it worth the time for others to read it?
- YY. **Tone** is the feeling that a book evokes in the reader. In many cases, this category best answers the question, "What are you in the mood for?" A more extensive list of tone descriptors and a brief definition of each is available in the above reference.
- Humorous, solemn, distant, intimate, ironic, arrogant, condescending, authoritative, scholarly, sentimental, angry, melancholy, anguished, youthful, optimistic, deadpan, satirical, maudlin, self-righteous, and so on.

Step 43 - Analysing Author and Publisher and Audience

Author

1. What is the author's background, Family, Family History, Every author's family what position they were in, university credentials, Ideology and worldview?
2. What credentials does s/he have?
3. What education and at what level?
4. The reason the writer wrote the text?
5. The writer's position on a particular subject?
6. How much research went into writer's own work?
7. How much experience does the author have?
8. Is the writer an expert in the topic at issue?
9. Is the author recognised by others as an authority in the field?
10. Is the author having knowledge of the field?
11. Did the author arrived to this conclusion through careful analysis?
12. Is this author the best representative for one or another side?
13. What are the author's bias and purpose?
14. Does the speaker or writer have personal or professional interest in the information they are presenting?
15. How a writer might purposely present ideas or events in ways that favour a particular political, organisational, religious?
16. Does the author present facts and explain the ideas to reader?
17. Is the author uses facts and opinions to argue for or against some idea?
18. Is the author tries to amuse or interest the reader with humour, suspense and stories?
19. Look at the language in the passage:
 - A. If it is neutral and objective, the purpose is probably simply to inform the reader
 - B. If it includes terms that are strongly positive, negative or emotional, the purpose is probably to persuade the reader
 - C. It is including situations or descriptions that are funny, surprising, or intriguing the writer probably wants to entertain the reader.
20. Is the author biased:

- A. Is the author presenting only one side of an argument?
 - B. Is it including only facts or examples that support the writer's opinion?
 - C. Is it using the language intended to influence the reader's emotions?
 - D. Is it ridicules other opinions or views
21. Does the author have contradictory information, cherry pick evidence or carefully select language in which to present information favourably?
 22. Is the author or speaker speaks/writes for the company, special interest group, an institute, a foundation think tank or a political party?
 23. Does she get paid for this endorsement or opinion?
 24. Does the person have interest on this topic or has any personal gain? If not then this writer or speaker is disinterested, impartial (unbiased) objective
 25. If the speaker/writer has interested, than why does s/he present the information/ argument/data in such a way?
 26. In surveys or studies, has the author worded the questions in such a way to ensure the sought after response?
 27. Is the company paid the author to proof that the devise or product is better than any other product in the market?
 28. Is the industry try to defend the product? Did the author put the best spin on its information?
 29. When was the survey or studies or experiment done?
 30. At what day were the tests, surveys or experiment done?
 31. Purpose of the author writing?
 32. How did the author handle the opposing view? Is the author trying to persuade the reader to some belief?
 33. Does the author fairly handled the opposing view? Or did the author dismiss opposing points without regard to their possible value?
 34. Does the writer made any straw man fallacy, misrepresenting opposing views to more easily move them down?
 35. Did the author used slanted language or commit personal attack?
 36. Does the writer make sweeping generalisations or demonstrate an either / or approach to complicated issues, thereby revealing a strong bias toward one side?
 37. Does the writer pretend to be objective?
 38. Does the writer intends to be ironic or satirical, if he or she is clearly exaggerating for effect?
 39. Does the writer admits to guesswork and speculation?

40. What are the author's sources?
41. Did the writer respond to those who have preceded them?
42. Has the writer depended on the primary source or secondary source?
43. Has the writer misquoted the primary source or has he quoted correctly the primary source?
44. Has the writer uses statistics or data, has he used primary source?
45. Has the writer interpreted the data or survey or statistics biased/unbiased?
46. Has the author correctly interpreted the information?
47. Has the author incorrectly interpreted information?

Publisher

1. Who is the publisher or sponsor?
2. Does writer use reliable publisher?
3. Does the writer use reputable publications?
4. Does the editor of the publication is respected and reputable?
5. Do the commercial interests dictate editorial policy of the publication? Or the publisher's
6. Is there periodical hoaxes or sabotage in the publication or publisher?
7. Has the editorial biased?
8. Have the editorials choose the topics and the perspective and slant of the writing?
9. Where does the editorial stand on political issues?
10. What does the table of content and ads use? And what political and cultural biases?
11. Does the scholarly presses and journals have any political or cultural stance?
12. Does the publisher protect and verify the statement they print to protect the reputation?
13. Is this article or book written by scholar? Or the books have been written by amateur or just get attention?
14. Is this book or article written with editing or review by disinterested parties?

Audience

1. Who is the intended audience?
2. Was it sponsored audience?
3. Real audience vs fake audience?
4. Who are the author's intended audience?
5. The book aimed at what audience? Uneducated, educated, experts etc? Is there any other targeted audience?
6. Is the book aimed at the readers far better versed than they are in the topic under study?
7. Is the audience familiar with the issue the author writes?
8. Is this article or book was written by the author to lead to agree with author's point of view?
9. Is the author tries to challenge the readers and the audience?
10. How has the audience Responded?
11. What has been written in response to the author's idea?
12. How the audience reviewed the book and the ideas?
13. Do the reviewers give bad or good mark to push their own agendas?
14. Is the quote from the book considered by scholars to be accurate and fair to the subject?
15. Is the biography or the quotes are based on the rumours and speculations?
16. What type of reputation does the writer has?
17. Do the other authors cite the writer?

Step 44 - How To Spot Bad Science

Unless you've studied it, most of us are never taught how to evaluate science or how to parse the good from the bad. Yet it is something that dictates every area of our lives. It is vital for helping us understand how the world works. It might be too much effort and time to appraise research for yourself, however. Often, it can be enough to consult an expert or read a trustworthy source.

But some decisions require us to understand the underlying science. There is no way around it. Many of us hear about scientific developments from news articles and blog posts. Some sources put the work into presenting useful information. Others manipulate or misinterpret results to get more clicks. So we need the thinking tools necessary to know what to listen to and what to ignore. When it comes to important decisions, like knowing what individual action to take to minimize your contribution to climate change or whether to believe the friend who cautions against vaccinating your kids, being able to assess the evidence is vital.

Much of the growing (and concerning) mistrust of scientific authority is based on a misunderstanding of how it works and a lack of awareness of how to evaluate its quality. Science is not some big immovable mass. It is not infallible. It does not pretend to be able to explain everything or to know everything. Furthermore, there is no such thing as "alternative" science. Science does involve mistakes. But we have yet to find a system of inquiry capable of achieving what it does: move us closer and closer to truths that improve our lives and understanding of the universe.

"Rather than love, than money, than fame, give me truth." Henry David Thoreau

There is a difference between bad science and pseudoscience. Bad science is a flawed version of good science, with the potential for improvement. It follows the scientific method, only with errors or biases. Often, it's produced with the best of intentions, just by researchers who are responding to skewed incentives.

Pseudoscience has no basis in the scientific method. It does not attempt to follow standard procedures for gathering evidence. The claims involved may be impossible to disprove. Pseudoscience focuses on finding evidence to confirm it, disregarding disconfirmation. Practitioners invent narratives to preemptively ignore any actual science contradicting their views. It may adopt the appearance of actual science to look more persuasive.

While the tools and pointers in this post are geared towards identifying bad science, they will also help with easily spotting pseudoscience.

Good science is science that adheres to the scientific method, a systematic method of inquiry involving making a hypothesis based on existing knowledge, gathering evidence to test if it is correct, then either disproving or building support for the hypothesis. It takes many repetitions of applying this method to build reasonable support for a hypothesis.

In order for a hypothesis to count as such, there must be evidence that, if collected, would disprove it.

In this post, we'll talk you through two examples of bad science to point out some of the common red flags. Then we'll look at some of the hallmarks of good science you can use to sort the signal from the noise. We'll focus on the type of research you're likely to encounter on a regular basis, including medicine and psychology, rather than areas less likely to be relevant to your everyday life.

[Note: we will use the terms "research" and "science" and "researcher" and "scientist" interchangeably here.]

Power Posing

"The saddest aspect of life right now is that science gathers knowledge faster than society gathers wisdom." —Isaac Asimov

First, here's an example of flawed science from psychology: power posing. A 2010 study by Dana Carney, Andy J. Yap, and Amy Cuddy entitled "Power Posing: Brief Nonverbal Displays Effects Neuroendocrine Levels and Risk Tolerance" claimed "open, expansive" poses caused participants to experience elevated testosterone levels, reduced cortisol levels, and greater risk tolerance. These are all excellent things in a high-pressure situation, like a job interview. The abstract concluded that "a person can, via a simple two-minute pose, embody power and instantly become more powerful." The idea took off. It spawned hundreds of articles, videos, and tweets espousing the benefits of including a two-minute power pose in your day.

Yet at least eleven follow up studies, many led by Joseph Cesario of Michigan State University including "'Power Poses' Don't Work, Eleven New Studies Suggest," failed to replicate the results. None found that power posing has a measurable impact on people's performance in tasks or on their physiology. While subjects did report a subjective feeling of increased powerfulness, their performance did not differ from subjects who did not strike a power pose.

One of the researchers of the original study, Carney, has since changed her mind about the effect. Carney stated she no longer believe the results of the original study.

Unfortunately, this isn't always how researchers respond when confronted with evidence discrediting their prior work. We all know how uncomfortable changing our minds is.

The notion of power posing is exactly the kind of nugget that spreads fast online. It's simple, free, promises dramatic benefits with minimal effort, and is intuitive. We all know posture is important. It has a catchy, memorable name. Yet examining the details of the original study reveals a whole parade of red flags. The study had 42 participants. That might be reasonable for preliminary or pilot studies. But is in no way sufficient to "prove" anything. It was not blinded. Feedback from participants was self-reported, which is notorious for being biased and inaccurate.

There is also a clear correlation/causation issue. Powerful, dominant animals tend to use expansive body language that exaggerates their size. Humans often do the same. But that doesn't mean it's the pose making them powerful. Being powerful could make them pose that way.

A TED Talk in which Amy Cuddy, the study's co-author, claimed power posing could "significantly change the way your life unfolds" is one of the most popular to date, with tens of millions of views. The presentation of the science in the talk is also suspect. Cuddy makes strong claims with a single, small study as justification. She portrays power posing as a panacea. Likewise, the original study's claim that a power pose makes someone "instantly become more powerful" is suspiciously strong.

This is one of the examples of psychological studies related to small tweaks in our behavior that have not stood up to scrutiny. We're not singling out the power pose study as being unusually flawed or in any way fraudulent. The researchers had clear good intentions and a sincere belief in their work. It's a strong example of why we should go straight to the source if we want to understand research. Coverage elsewhere is unlikely to even mention methodological details or acknowledge any shortcomings. It would ruin the story. We even covered power posing on Farnam Street in 2016—we're all susceptible to taking these 'scientific' results seriously, without checking on the validity of the underlying science.

It is a good idea to be skeptical of research promising anything too dramatic or extreme with minimal effort, especially without substantial evidence. If it seems too good to be true, it most likely is.

Green Coffee Beans

“An expert is a person who has made all the mistakes that can be made in a very narrow field.” —Niels Bohr

The world of weight-loss science is one where bad science is rampant. We all know, deep down, that we cannot circumnavigate the need for healthy eating and exercise. Yet the search for a magic bullet, offering results without effort or risks, continues. Let's take a look at one study that is a masterclass in bad science.

Entitled “Randomized, Double-Blind, Placebo-Controlled, Linear Dose, Crossover Study to Evaluate the Efficacy and Safety of a Green Coffee Bean Extract in Overweight Subjects,” it was published in 2012 in the journal *Diabetes, Metabolic Syndrome and Obesity: Targets and Therapy*. On the face of it, and to the untrained eye, the study may appear legitimate, but it is rife with serious problems, as Scott Gavura explained in the article “Dr. Oz and Green Coffee Beans – More Weight Loss Pseudoscience” in the publication *Science-Based Medicine*. The original paper was later retracted by its authors. The Federal Trade Commission (FTC) ordered the supplement manufacturer who funded the study to pay a \$3.5 million fine for using it in their marketing materials, describing it as “botched.”

The Food and Drug Administration (FDA) recommends studies relating to weight-loss consist of at least 3,000 participants receiving the active medication and at least 1,500 receiving a placebo, all for a minimum period of 12 months. This study used a mere 16 subjects, with no clear selection criteria or explanation. None of the researchers involved had medical experience or had published related research. They did not disclose the conflict of interest inherent in the funding source. It didn't cover efforts to avoid any confounding factors. It is vague about whether subjects changed their diet and exercise, showing inconsistencies. The study was not double-blinded, despite claiming to be. It has not been replicated.

The FTC reported that the study's lead investigator “repeatedly altered the weights and other key measurements of the subjects, changed the length of the trial, and misstated which subjects were taking the placebo or GCA during the trial.” A meta-analysis by Rachel Buchanan and Robert D. Beckett, “Green Coffee for Pharmacological Weight Loss” published in the *Journal of Evidence-Based Complementary & Alternative Medicine*, failed to find evidence for green coffee beans being safe or effective; all the available studies had serious methodological flaws, and most did not comply with FDA guidelines.

Signs of Good Science

“That which can be asserted without evidence can be dismissed without evidence.” —Christopher Hitchens

We’ve inverted the problem and considered some of the signs of bad science. Now let’s look at some of the indicators a study is likely to be trustworthy. Unfortunately, there is no single sign a piece of research is good science. None of the signs mentioned here are, alone, in any way conclusive. There are caveats and exceptions to all. These are simply factors to evaluate.

It’s Published by a Reputable Journal

“The discovery of instances which confirm a theory means very little if we have not tried, and failed, to discover refutations.” —Karl Popper

A journal, any journal, publishing a study says little about its quality. Some will publish any research they receive in return for a fee. A few so-called “vanity publishers” claim to have a peer-review process, yet they typically have a short gap between receiving a paper and publishing it. We’re talking days or weeks, not the expected months or years. Many predatory publishers do not even make any attempt to verify quality.

No journal is perfect. Even the most respected journals make mistakes and publish low-quality work sometimes. However, anything that is not published research or based on published research in a journal is not worth consideration. Not as science. A blog post saying green smoothies cured someone’s eczema is not comparable to a published study. The barrier is too low. If someone cared enough about using a hypothesis or “finding” to improve the world and educate others, they would make the effort to get it published. The system may be imperfect, but reputable researchers will generally make the effort to play within it to get their work noticed and respected.

It’s Peer Reviewed

Peer review is a standard process in academic publishing. It’s intended as an objective means of assessing the quality and accuracy of new research. Uninvolved researchers with relevant experience evaluate papers before publication. They consider factors like how well it builds upon pre-existing research or if the results are statistically significant. Peer review should be double-blinded. This means the researcher doesn’t know who is reviewing their work and the reviewer doesn’t know who the researcher is.

Publishers only perform a cursory “desk check” before moving onto peer review. This is to check for major errors, nothing more. They cannot have the expertise necessary to vet the

quality of every paper they handle—hence the need for external experts. The number of reviewers and strictness of the process depends on the journal. Reviewers either declare a paper unpublishable or suggest improvements. It is rare for them to suggest publishing without modifications.

Sometimes several rounds of modifications prove necessary. It can take years for a paper to see the light of day, which is no doubt frustrating for the researcher. But it ensures no or fewer mistakes or weak areas.

Pseudoscientific practitioners will often claim they cannot get their work published because peer reviewers suppress anything contradicting prevailing doctrines. Good researchers know having their work challenged and argued against is positive. It makes them stronger. They don't shy away from it.

Peer review is not a perfect system. Seeing as it involves humans, there is always room for bias and manipulation. In a small field, it may be easy for a reviewer to get past the double-blinding. However, as it stands, peer review seems to be the best available system. In isolation, it's not a guarantee that research is perfect, but it's one factor to consider.

The Researchers Have Relevant Experience and Qualifications

One of the red flags in the green coffee bean study was that the researchers involved had no medical background or experience publishing obesity-related research.

While outsiders can sometimes make important advances, researchers should have relevant qualifications and a history of working in that field. It is too difficult to make scientific advancements without the necessary background knowledge and expertise. If someone cares enough about advancing a given field, they will study it. If it's important, verify their backgrounds.

It's Part of a Larger Body of Work

“Science, my lad, is made up of mistakes, but they are mistakes which it is useful to make, because they lead little by little to the truth.” —Jules Verne

We all like to stand behind the maverick. But we should be cautious of doing so when it comes to evaluating the quality of science. On the whole, science does not progress in great leaps. It moves along millimeter by millimeter, gaining evidence in increments. Even if a piece of research is presented as groundbreaking, it has years of work behind it.

Researchers do not work in isolation. Good science is rarely, if ever, the result of one person or even one organization. It comes from a monumental collective effort. So when evaluating research, it is important to see if other studies point to similar results and if it is

an established field of work. For this reason, meta-analyses, which analyze the combined results of many studies on the same topic, are often far more useful to the public than individual studies. Scientists are humans and they all make mistakes. Looking at a collective body of work helps smooth out any problems. Individual studies are valuable in that they further the field as a whole, allowing for the creation of meta-studies.

Science is about evidence, not reputation. Sometimes well-respected researchers, for whatever reason, produce bad science. Sometimes outsiders produce amazing science. What matters is the evidence they have to support it. While an established researcher may have an easier time getting support for their work, the overall community accepts work on merit. When we look to examples of unknowns who made extraordinary discoveries out of the blue, they always had extraordinary evidence for it.

Questioning the existing body of research is not inherently bad science or pseudoscience. Doing so without a remarkable amount of evidence is.

It Doesn't Promise a Panacea or Miraculous Cure

Studies that promise anything a bit too amazing can be suspect. This is more common in media reporting of science or in research used for advertising.

In medicine, a panacea is something that can supposedly solve all, or many, health problems. These claims are rarely substantiated by anything even resembling evidence. The more outlandish the claim, the less likely it is to be true. Occam's razor teaches us that the simplest explanation with the fewest inherent assumptions is most likely to be true. This is a useful heuristic for evaluating potential magic bullets.

It Avoids or at Least Discloses Potential Conflicts of Interest

A conflict of interest is anything that incentivizes producing a particular result. It distorts the pursuit of truth. A government study into the health risks of recreational drug use will be biased towards finding evidence of negative risks. A study of the benefits of breakfast cereal funded by a cereal company will be biased towards finding plenty of benefits. Researchers do have to get funding from somewhere, so this does not automatically make a study bad science. But research without conflicts of interest is more likely to be good science. High-quality journals require researchers to disclose any potential conflicts of interest. But not all journals do. Media coverage of research may not mention this (another reason to go straight to the source). And people do sometimes lie. We don't always know how unconscious biases influence us.

It Doesn't Claim to Prove Anything Based on a Single Study

In the vast majority of cases, a single study is a starting point, not proof of anything. The results could be random chance, or the result of bias, or even outright fraud. Only once other researchers replicate the results can we consider a study persuasive. The more replications, the more reliable the results are. If attempts at replication fail, this can be a sign the original research was biased or incorrect.

A note on anecdotes: they're not science. Anecdotes, especially from people close to us or those who have a lot of letters behind their name, have a disproportionate clout. But hearing something from one person, no matter how persuasive, should not be enough to discredit published research. Science is about evidence, not proof. And evidence can always be discredited.

It Uses a Reasonable, Representative Sample Size

A representative sample represents the wider population, not one segment of it. If it does not, then the results may only be relevant for people in that demographic, not everyone. Bad science will often also use very small sample sizes.

There is no set target for what makes a large enough sample size; it all depends on the nature of the research. In general, the larger, the better. The exception is in studies that may put subjects at risk, which use the smallest possible sample to achieve usable results. In areas like nutrition and medicine, it's also important for a study to last a long time. A study looking at the impact of a supplement on blood pressure over a week is far less useful than one over a decade. Long-term data smooths out fluctuations and offers a more comprehensive picture.

The Results Are Statistically Significant

Statistical significance refers to the likelihood, measured in a percentage, that the results of a study were not due to pure random chance. The threshold for statistical significance varies between fields. Check if the confidence interval is in the accepted range. If it's not, it's not worth paying attention to.

It Is Well Presented and Formatted

"When my information changes, I alter my conclusions. What do you do, sir?" —John Maynard Keynes

As basic as it sounds, we can expect good science to be well presented and carefully formatted, without prominent typos or sloppy graphics.

It's not that bad presentation makes something bad science. It's more the case that researchers producing good science have an incentive to make it look good. As Michael J. I. Brown of Monash University explains in *How to Quickly Spot Dodgy Science*, this is far more than a matter of aesthetics. The way a paper looks can be a useful heuristic for assessing its quality. Researchers who are dedicated to producing good science can spend years on a study, fretting over its results and investing in gaining support from the scientific community. This means they are less likely to present work looking bad. Brown gives an example of looking at an astrophysics paper and seeing blurry graphs and misplaced image captions—then finding more serious methodological issues upon closer examination. In addition to other factors, sloppy formatting can sometimes be a red flag. At the minimum, a thorough peer-review process should eliminate glaring errors.

It Uses Control Groups and Double-Blinding

A control group serves as a point of comparison in a study. The control group should be people as similar as possible to the experimental group, except they're not subject to whatever is being tested. The control group may also receive a placebo to see how the outcome compares.

Blinding refers to the practice of obscuring which group participants are in. For a single-blind experiment, the participants do not know if they are in the control or the experimental group. In a double-blind experiment, neither the participants nor the researchers know. This is the gold standard and is essential for trustworthy results in many types of research. If people know which group they are in, the results are not trustworthy. If researchers know, they may (unintentionally or not) nudge participants towards the outcomes they want or expect. So a double-blind study with a control group is far more likely to be good science than one without.

It Doesn't Confuse Correlation and Causation

In the simplest terms, two things are correlated if they happen at the same time. Causation is when one thing causes another thing to happen. For example, one large-scale study entitled "Are Non-Smokers Smarter than Smokers?" found that people who smoke tobacco tend to have lower IQs than those who don't. Does this mean smoking lowers your IQ? It might, but there is also a strong link between socio-economic status and smoking. People of low income are, on average, likely to have lower IQ than those with higher incomes due to factors like worse nutrition, less access to education, and sleep deprivation. A study by the Centers for Disease Control and Prevention entitled "Cigarette Smoking and Tobacco

Use Among People of Low Socioeconomic Status,” people of low socio-economic status are also more likely to smoke and to do so from a young age. There might be a correlation between smoking and IQ, but that doesn’t mean causation.

Disentangling correlation and causation can be difficult, but good science will take this into account and may detail potential confounding factors of efforts made to avoid them.

Conclusion

“The scientist is not a person who gives the right answers, he’s one who asks the right questions.” —Claude Lévi-Strauss

The points raised in this article are all aimed at the linchpin of the scientific method—we cannot necessarily prove anything; we must consider the most likely outcome given the information we have. Bad science is generated by those who are willfully ignorant or are so focused on trying to “prove” their hypotheses that they fudge results and cherry-pick to shape their data to their biases. The problem with this approach is that it transforms what could be empirical and scientific into something subjective and ideological.

When we look to disprove what we know, we are able to approach the world with a more flexible way of thinking. If we are unable to defend what we know with reproducible evidence, we may need to reconsider our ideas and adjust our worldviews accordingly. Only then can we properly learn and begin to make forward steps. Through this lens, bad science and pseudoscience are simply the intellectual equivalent of treading water, or even sinking.

Article Summary

- Most of us are never taught how to evaluate science or how to parse the good from the bad. Yet it is something that dictates every area of our lives.
- Bad science is a flawed version of good science, with the potential for improvement. It follows the scientific method, only with errors or biases.
- Pseudoscience has no basis in the scientific method. It does not attempt to follow standard procedures for gathering evidence. The claims involved may be impossible to disprove.
- Good science is science that adheres to the scientific method, a systematic method of inquiry involving making a hypothesis based on existing knowledge, gathering evidence to test if it is correct, then either disproving or building support for the hypothesis.
- Science is about evidence, not proof. And evidence can always be discredited.
- In science, if it seems too good to be true, it most likely is.

Signs of good science include:

- It's Published by a Reputable Journal
- It's Peer Reviewed
- The Researchers Have Relevant Experience and Qualifications
- It's Part of a Larger Body of Work
- It Doesn't Promise a Panacea or Miraculous Cure
- It Avoids or at Least Discloses Potential Conflicts of Interest
- It Doesn't Claim to Prove Anything Based on a Single Study
- It Uses a Reasonable, Representative Sample Size
- The Results Are Statistically Significant
- It Is Well Presented and Formatted
- It Uses Control Groups and Double-Blinding
- It Doesn't Confuse Correlation and Causation

Step 45-Content Of Critical Review

Content of Critical Review

1. Always Read Both sides of the story to come to your own conclusion.
2. The researcher needs to evaluate the research that has already been undertaken in the area of your research project,
3. Show and explain the relationship between published research findings and reference the literature in which they were reported.
4. Your review will also enable the readers to see your ideas against the background of previous published research in the area.
5. The researcher needs to be highly critical of the earlier research reported in the literature. If you want to be highly.
6. Critical the research must review the literature, explain clearly why it is problematic, and justify your own idea.
7. Considering content of critical review, the research need
 - A. To include the key academic theories within chosen area of research.
 - B. To demonstrate that your knowledge of chosen area is up to date.
 - C. Through clear referencing, enable those reading your project report to find the original publications which you cite.
 - D. The research needs to avoid plagiarism.
8. Have you ensured that the literature covered relates clearly to your research question?
9. Have you covered the most relevant and significant theories of recognised experts in the area?
10. Have you covered the most relevant and significant literature or at least a representative sample?
11. Have you included up to date literature?
12. Have you referenced all the literature used in the format prescribed in the assessment criteria?
13. What is really meant by being critical about the content
14. There are 5 aspects of critical approach that should e fostered by researcher:
 - A. Critique of rhetoric-this means appraising or evaluating a problem with effective use of language. In the context of your critical literature review, this emphasises the need for you, as the reviewer to use your skills both of making reasoned judgements and of arguing effectively in writing.

- B. Critique of tradition.
 - C. Critique of authority.
 - D. Critique of objectivity.
15. Questioning everything you read, and be sceptic. This means you need to be consistently considering and justifying with clear arguments your own critical stance.
 16. Part of the researcher judgement will inevitably mean being able to identify the most relevant and significant theories and recognised experts highlighted.
 17. The researcher needs to:
 - A. Refer to and assess research by recognised experts in chosen area.
 - B. Consider and discuss research that supports and research that opposes the idea.
 - C. Make reasoned judgement regarding the value of others' research, showing clearly how it related to the topic of the research.
 - D. Justify the arguments with valid evidence in a logical manner.
 - E. Distinguish clearly between facts and opinions.
 18. The researcher needs to read widely on the research topic and have good knowledge and understanding of literature.
 19. The researcher needs to comment on merits and faults of key literature within the chosen area.
 20. Have you shown how your research question related to previous research reviewed?
 21. Have you assessed the strengths and weaknesses of the previous researched reviewed?
 22. Have you been objective in your discussion and assessment of another people's research?
 23. Have you included referenced to research that is counter to your own opinion?
 24. Have you distinguished clearly between facts and opinions?
 25. Have you make reasoned judgement about the value and relevance of others' research to your own?
 26. Have you justified clearly your own ideas?
 27. Have you highlighted those areas where new research (yours) is needed to provide fresh insights and taken these into account in your arguments? In particular:
 - A. Where there are inconsistencies in current knowledge and understanding?
 - B. Where there are omissions or bias in published research?
 - C. Where research findings need to be tested further?
 - D. Where evidence is lacking, inconclusive contradictory or limited?
 28. Have you justified your arguments by referencing correctly published research?

*Step 46 - The Funding of Book, Author,
Publisher, Speaker, Presenter, School,
Government, Politician, Companies,
Influencer, Newspaper, Journalist or Other
Person.*

Rule 0- Listen and Follow The Books in The Following Folders:

- 1. Archeology Folder**
- 2. Atlas Folder**
- 3. Concordance Folder**
- 4. Cultural practice Folder**
- 5. Dictionary Folder**
- 6. Discourse Analysis Folder**
- 7. Encyclopedia Folder**
- 8. Fake News Folder**
- 9. Figure of Speech Folder**
- 10. Geography Folder**
- 11. Handbook Folder**
- 12. Introduction to Old and New Testament Folder**
- 13. Legal analysis Folder**
- 14. Literature Review Folder**
- 15. Mathematics Folder**
- 16. Military and War Folder**
- 17. Politics Folder**
- 18. Probability and Statistics Folder**
- 19. Religious Customs Folders**

- 20. Rhetorical Review Folder**
- 21. Statistics Folder**
- 22. Survey of Old and New Testament Folder**
- 23. Symbols folder**
- 24. Systematic Theology Folder**

Rule 1-Sponsor and Follow the money.

1. Who is the sponsor?
2. Watch What Sponsors Do and Not What they talk.
3. Who gave the funds? One person or group of people?
4. Why are they have been sponsored?
5. How much were they sponsored?
6. Almost at the end ask questions about the funds provided to the author, presenter, researcher, speaker, publisher and find out about the source of the funds provided.
This is the outside research needs to be done. Follow the money
7. Who funded this whole scheme and situation?
8. Where the funds came from?
9. Where the funds where? Who received the funds?
10. Were these funds for influencing?
11. Were these funds for political reason?
12. Where these funds for legal reason?
13. Where these funds for lobbyism?
14. Does this type of funding influence research?
15. Follow the money and funding.
16. Research who is behind the funding; name, companies, politicians etc.
17. Who paid for this situation to occur?
18. Who sponsored this event. Situation? Show the diagram.
19. How much was it paid to the people for this event?
20. How did they paid this? Was it directly, indirectly or off shore companies, companies, charity, charity groups, other groups, people from the company?
21. What currency was it paid?
22. What other reward was at stake for these people? New job, some incentive?
23. Make a line of web who I sponsoring and who is gaining?
24. How these people related to the lobbyist or sponsor?
25. Was it use different?
26. How did the transaction happened?
27. What has been used to sponsor those people?
28. What did they do with the funds?
29. What people incentives were?

Rule 2-Corruption and follow the money

1. What are the corruption scheme in this situation/government, company, person or group of people?
2. Ask for the full names, job titles and locations of:
3. The persons who solicited or received the bribe and the persons or companies that paid the bribe, or offered to do so.
4. Any agents, middlemen and subcontractors involved in the payments.
5. Try to get as many details as possible of the alleged bribes, including:
6. How much money was involved in the bribe payments and the overall transactions?
7. What the bribe payments were for, for example, to be selected, to get a contract amendment, to be paid promptly, etc.?
8. How the payments were made – by cash, wire transfer or check, or in the form of goods or services – and how the payments were recorded – for example, as a “consulting fee” or commission or miscellaneous expenses. Ask who was involved in these transactions.
9. Try to identify the account (or at least the bank) or source of funds from which the payments were made, and the bank or accounts to which they were made.
10. Ask about documentation of the bribe payments and the evidence corrupt influence. This could include, of course, bank account records, wire transfer receipts, or false invoices and receipts to disguise the payments. Evidence of corrupt influence could include documentation showing inflated pricing, acceptance of poor quality work, approval of unnecessary change orders, etc. Ask who has the records and where are they? Request copies. Ask for emails or other communications regarding the scheme.
11. Get the names and location of other persons who might know of the scheme, such as former employees or competitors of the bribe payer (who also might have been approached for bribes), associates or subordinates of the bribe taker.

Rule 3-Legal VS Illegal Schemes

1. What are the corruption diagrams in this situation by government, company, person or group of people?
2. Was this legal scheme?
3. Was there any hidden in the accounting? What was hidden? What was tried to be hidden? Why was hidden?
4. What scheme did they use regarding funding?
5. Was this legal?

6. What are the schemes? Legal vs illegal? What are the evidence or proof?
7. Does this violated any law or regulations? Constitution, tax, finance economic, legal or other regulations?
8. What are the names who involved in this scheme:
 - A. Names
 - B. Addresses
 - C. Company names
 - D. Charity
 - E. Group names
 - F. Government agencies
 - G. Regulation agencies
 - H. Government bodies
 - I. Name in the government
9. How did the corruption occurred.
10. What is corruption?
11. Which countries are the most corrupt?
12. What are the common characteristics of countries with high corruption?
13. What is the magnitude of corruption? (5) Do higher wages for bureaucrats reduce corruption?
14. Can competition reduce corruption?
15. Why have there been so few (recent) successful attempts to fight corruption?
16. Does corruption adversely affect growth?
17. Do you know or suspect, or have you heard, that kickbacks are being paid?
18. Questions to identify parties and potential witnesses include:
 - Please identify all persons and organizations that might be involved in suspect transactions, including all:
 - I. Contractors
 - II. Subcontractors
 - III. Suppliers
 - IV. Agents or middlemen
 - V. Project or government officials
19. Have any bidders filed protests or complaints or voiced suspicions?
20. Are any unnecessary or questionable agents or middlemen involved in any contracts?
21. Are any agents or middlemen paid unreasonably high fees?

22. Do any project or government officials refer contractors to certain suppliers, subcontractors or agents?

23. Questions about selection and performance include:

- Are questionable selection methods, e.g., unjustified sole source awards, employed?
- Do any contractors charge unreasonably high prices, which are accepted by project or government officials?
- Do any contractors receive an unusually high volume of contracts?
- Is the quality of any contractor's work consistently unsatisfactory, but accepted by project or government officials?
- Do any contractors consistently miss delivery or completion dates without penalty?
- Do any contractors receive questionable, or an unusually high number of, change orders?

24. Questions about the behavior of the project or government officials include:

- Do any project or government officials:
 - I. Give favorable treatment to certain contractors?
 - II. Routinely ignore or excuse poor or late service by particular contractors?
 - III. Have an unusual interest in the selection or success of a particular contractor, or in a particular contract?
 - IV. Take any actions with regard to certain contractors, or contracts, that are outside, or below, their normal duties?
 - V. Routinely ignore standard policy and procedure to benefit a certain contractor?

25. Questions about the relationship between parties include:

- Is there close socialization or a "less than arm's length relationship" between any contractor and project or government officials?
- Do any project or government officials:
 - I. Accept inappropriate gifts, travel or entertainment from any contractors?
 - II. Display new or unexplained wealth?
 - III. Appear to have financial problems?
 - IV. Officials have outside business interests or companies?
- Have all project and government officials filed required conflict of interest and financial disclosure forms?

26. Questions about contract documentation include:

- Do any contractors submit inflated or questionable invoices, or fail to provide adequate documentation for them?
- Do any project or government officials routinely ignore or tolerate the submission of inadequate documentation by certain contractors?
- Are change order requests and payments adequately documented for all contractors?
- Are controls and procedures to prevent bribes and kickbacks in place and enforced?

Rule 4-Conflict of Interest

1. Was there Conflict of interest?
2. How does the Conflict of Interest occur?
3. How do we know that Conflict of Interest Occurred?

Rule 4-Trust of the Source

1. Where did the data has been found?
2. Can I trust sources of the information?

Rule 5-Who is interesting in the situation

1. Watch What They Do and Not What they talk.
2. Deep State, Who is in the deep state: Names, Ages, What are their position, Where did they study, Who are they studied with, who are their parents. Where they lived.
3. Who are the Shadow People or person who controls everything in government? Names, Ages, What are their position, Where did they study, Who are they studied with? who are their parents. Where they lived.
4. Who is the CEO, CFO, Risk managers, Board of Directors, Shareholders, stakeholders of the company, Organisation? Names, Ages, What are their position, Where did they study, Who are they studied with? who are their parents. Where they lived
5. Who are the shadow CEO, CFO, Risk manager, Board of Directors, shareholders, stakeholders of the company, organisation: Names, Ages, What are their position, Where did they study, Who are they studied with, who are their parents. Where they lived.
6. Who has interest in this situation?
7. Who is the interested group or party? Do the diagram of how they are related to this situation and how they would gain out of this situation?
8. Who lobbying this?
9. Who is the person/organisation or group that this situation is the most useful?
10. Who is the person/organisation or group that this situation is least useful?
11. Did the author used all AVAILABLE SOURCES, INFORMATION, FACTS AND ARGUMENTS TO HIM/HER?
12. Does the author trying to rewrite facts, information, history of the subject to fit his/her arguments and situation?
13. Did the author do honest analysis of all available sources, information, arguments, evidence and facts?
14. Whom this situation is the most useful?
15. Whom this situation is the least useful?
16. What Capital Group is winner in this situation?
17. What Capital Group is Loser in this situation?
18. Who is the winner of this situation?
19. Who is the loser of this situation?
20. Who is the victim in this situation?
21. Who is not the victim in this situation?
22. Who is the most likely used this situation to his/her/their advantage?

23. Who is the least likely used this situation to his/her/their advantage?
24. Who got harm in this situation?
25. Who did not get harm in this situation?
26. Almost at the end ask questions about the funds provided to the author, presenter, researcher, speaker, publisher and find out about the source of the funds provided.
This is the outside research needs to be done. Follow the money
27. Who or what is the most influenced in this situation?
28. What are the corruption scheme in this situation/government, company, person or group of people?
29. What are the corruption diagrams in this situation by government, company, person or group of people?
30. Who is at fault in this situation?
31. Who is not at fault in this situation?
32. Who funded this whole scheme and situation?
33. Where the funds came from?
34. Where the funds where? Who received the funds?
35. Was this legal scheme?
36. Is the current situation or crisis or breaking news is there to cover something bigger behind? Like trying to pass new laws or corruption or purchase which are illegal. What are these things that been tried to hid behind big news. Research everything?
37. Who losing the most in this situation?
38. Who is losing least in this situation?
39. Who is winning the most in this situation
40. Who is the winning least in this situation?
41. Does the person tried to incorrectly paraphrase the arguments or facts or evidence?
42. Is there conflict of interest between these two parties?
43. Who is the breaking conflict of interest?
44. Was there are any Break a law, code of, GDPR?
45. Was there any hidden in the accounting? What was hidden? What was tried to be hidden? Why was hidden?
46. What or who the person tried to protect?
47. Was there any motivation behind some of the actions?
48. What was the motivation behind these actions?
49. What are the mathematical formulas behind?

50. What are the flow chart of decision. What would be outcome if they would decide one way or the other?
51. Was the person who speaking, presenting, author, researcher representing other side correctly and honestly?
52. Was the speaker, presenter, author and researcher were paid by somebody to do the propaganda and throw the dirt on other people?
53. Was there any propaganda used in the speech, research, book or article so that they/ he/ she advising about other side incorrectly?
54. Did I use evidence, facts and sources for every argument, premise, conclusion and sentence?
55. Did the other side used sources, facts, evidence for every sentence, premise, argument and conclusion?
56. Did the analogies are correct?
57. Did the analogies really represent other side or my side?
58. What type of arguments presented by other side?
59. Was other side used epithets about other side? Was this is logical fallacy? Did I use the epithets? Did the other side understand this epithets? Why did they think this was appropriate way or time to say this? Was this what other person think? Was this objectively true or not? Was this breaking any law?
60. Does the other side understand the definition of this term?
61. Was this is a troll who is not looking to get the correct information, but troll others and me?
62. Is this person looking appropriate discussion?
63. Is this person trying to persuade you appropriately with full information which is correct or incorrect?
64. Would you apologise if provided facts and evidence were wrong for the arguments which were lead to wrong conclusion?
65. Does the person know or understand that he/she/they are wrong or right?
66. Why they they think they are right?
67. Why they think they are wrong?
68. How do we know that this happened exactly the way he said? Do we have facts? Evidence?
69. Use **What, who, why, when, where, how, do , did, can, may do not, did not, cannot may not, might, might not, does, does not.**
70. Does the person has the education to speak about this subject.

71. Does the person has honestly went through the criticism of the opposing ideas? Did the person found the reason he opposing to the other person?
72. Does the person have serious intention to confuse audience?
73. How well does the person do the job to confuse the audience?
74. Did the person introduced new terms or arguments.
75. Did the other person did a good job to research his her ideas and opposing person ideas?
76. What is the reason the person trying to confuse audience?
77. What propaganda tools did the author, speaker, writer used in analysing this idea and opposing person idea?
78. Did the person understood or understand that he used propaganda tools.
79. What sources did the other person used in analysing opposing person arguments?

Rule 6-Complaint

1. The full names, job titles and contact information for all persons and organizations allegedly involved.
2. The details (who, what, when, where, why and how much) of the allegations.
3. The dates or time period of the key events.
4. How much money or losses are involved.
5. Are there any records or documents that support the allegations? If so, what and who has them? Ask for electronic and paper copies.
6. The names, location and contact information of other persons who might know of the wrongdoing and be willing to discuss it.
7. Are there other similar transactions? If so, get the details, and find out who knows about them.
8. How does the complainant know about the allegations? If from other persons, who and where are they?
9. Is the scheme currently on-going? If so, do the subject(s) know of the complainant's report? (This helps to determine whether a covert investigation would be feasible.)
10. Will the complainant agree to testify or sign a statement? (Many will not, but their information is still useful to identify leads, documents and other witnesses who will testify. Assure the witness that he or she will not be compelled to testify if unwilling to do so.)
11. What is the complainant's motive to report? (In most cases, the complainant's motive is not as important as his or her credibility.)
12. Try to determine if there is any reason to suspect the complainant's credibility, such as a personal interest in the transactions, a history of disputes between the parties or a criminal record.

Rule 7-Power in Society

1. Who has the power in society?
2. Watch What Sponsors Do and Not What they talk.
3. List of the groups, companies government who has the power in society?
4. Why do I think this group has the power in the society?
5. Who is the shadow controlling?
6. Who is shadow government?
7. Who is in the control behind?
8. Make a list of the groups who control behind?
9. Why do I think this group is in control?

Rule 8-Why author choose these facts

1. Why the author choose these facts?
2. Why author choose these figures?
3. Why author choose these evidences?
4. Does these facts or facts or evidence make stronger the argument or weaken?

Rule 9-Rewrite History

1. Does the author, presenter, speaker tries to rewrite the history or story?
2. Why does the author, presenter, speaker tries to rewrite the history or story?
3. What facts does the author hides or suppress to rewrite the history?
4. What is the reason of the author, presenter, speaker tries to rewrite the history or story?

Rule 10-Dividing groups into smaller groups

1. Does the author, presenter, speaker tried to divide the nation or the group into different groups? What are the groups the author, presenter or speaker tries to divide the people? Make a list
2. How is the author, presenter and speaker tries to divide the group of people?
3. Does the author tries to set up each group against each other? Why do the author tries to set up two groups against each other?
4. Does the author or presenter or speaker tries to segregate the people? Into what groups does the author, speaker, presenter tries to segregate the people into?

5. What is the reason does the author, presenter or speaker tries to divide and segregate people into? Is there any motivation?

Rule 11-Affiliating with Political party

1. Does the presenter or speaker or author affiliate to one of the political party? What party does the author, speaker presenter belongs to?
2. Why is the author belongs to the party?
3. Why is the author not belong to the party?

Rule 12-Affiliating with organisation

1. Does the author, presenter or speaker belongs to the organisation? What organisation does the author, presenter or speaker belongs to?
2. What does the organisation doing? How they try to influence the world?

Rule 13-Influence the world

1. Does the author, presenter, speaker tries to influence the world?
2. How does the author , presenter, speaker tries to influence the world?
3. What way does the author, presenter, speaker tries to influence the world?
4. Why does the author, presenter, speaker tries to influence the world? To gain political, military, financial power? What other power does the author, presenter, speaker tries to gain?

Rule 13-Does the author tries to provoke?

1. Does the author, speaker, presenter tries to provoke some sort of disruption?
2. Why are the reason of this provoked disruption?

Rule 15-Influence with mass media

1. Does the shadow government tries to influence people through the mass media?
2. Who is sponsoring mass media?
3. How they are trying to influence through mass media?
4. What reforms does the shadow government tries to pass in order to satisfy shadow government

Rule 16-Destroy

1. Is anybody tries to destroy the foundation of the following:
 - Government
 - Mass media
 - Family
 - Nation
 - Institution
 - Education
 - Moral
 - Ethics
 - Etc
2. Who are trying to destroy the foundation?
3. Why are they trying?
4. How are they trying?
5. What are they doing to destroy?

Rule 17-Ethical vs Unethical Manner

1. Did the author used the details in ethical manner?
2. Did the author or presenter used the research in ethical manner?
3. Was there unethical behaviour with the research and the sources?

Rule 18-Impact Others

1. How does this situation impact others?
2. How does the speech, writing, presentation impact others?
3. Why is this impact others?
4. What are the reasons that this would or is impacting others?
5. Global impact of the author, presenter, speaker, writer, situation to other.
6. Geopolitical impact analysis.
7. Why is this impact on the other people.
8. Who will this be impacted?
9. How this research impact others?
10. Make a list who will be impacted
11. Make a mind map how they will be impacted.

Rule 19-Lie

1. Where does the author, researcher, writer, presenter and speaker lying ?
2. Is this intentional lying or accidental?
3. Who this lie will impact?
4. What this lie impact?
5. What are the reason of this lie?
6. Why do I think this is lie?

Rule 20-Information and knowledge Fit

1. How this piece in the world of knowledge?
2. How this will impact the world and other people?
3. How does the information fit with each other?
4. How does the information relation with each other?
5. How does the information fit with each other in the world.
6. How does the information relation with each other in the world?

Rule 21-Interested party and groups in Narrative

1. What interested party has the most interest in this narrative??
2. What interested party has the least interest in this narrative?
3. What interest party controls this narrative?
4. Is this narrative based on truth or lie?
5. Why is this narrative is based on truth?
6. Why is this narrative is based on Lie?
7. Why author, speaker, researcher, journalist, presenter lying to the audience?
8. Why author, speaker, researcher, journalist, presenter telling truth to the audience?
9. What is the reason of this lie?
10. What is the reason of this truth?
11. What narrative does the author, researcher, speaker, journalist, presenter trying to push? Why is this? What is the reason?
12. What narrative does the author, researcher speaker, journalist, presenter tries to represent? What is the reason? Why?
13. Is this narrative has strategic point, target? Why?
14. Why does the author says the truth? What is it up to? Is this strategic decision to tell a truth? Does the author tries to do moral, ethical or strategic? Is this selective or not?

15. Why does the author say the Lie? What is it up to? Is this strategic decision to tell a Lie? Does the author try to do moral, ethical or strategic? Is this selective or not?
16. What group or interested party does the author represent? What is the reason and why?
17. What worldview does the author, researcher, speaker, journalist, present try to create with this lie or truth?
18. What are they trying to achieve with this lied or truthful narrative?
19. What are they trying to achieve by lie or truth? What end of result they are trying to achieve?
20. Has the author, presenter, researcher, speaker try to wash out themselves by using lie or truth?
21. Does the author, representative, presenter, researcher, speaker try to wash out the interested group or party by showing how good is this party is?
22. Does the author use selective narrative in representation of the worldview?
23. Make a list of following"
 - I. How many truth statements made
 - II. How many truth facts made
 - III. How many lie statements made
 - IV. How many lie facts made
 - V. What conclusion can we make out of this

Rule 22-Tools author, presenter, writer, researcher, speaker representative used

1. Why do the author, presenter, researcher, speaker, representative use emotional tools to persuade audience? What emotional tools used?
2. Why do the author, presenter, researcher, speaker, representative use psychological tools to persuade audience? What tools do they use?
3. What are the performing arts tools?
4. What are the visual arts tools?
5. What are history tools?
6. What are language tools
7. What are linguistic and literature tools?
8. What are Law tools?
9. What are philosophy tools?
10. What are theology tools?
11. What are anthropology tools?
12. What are archeology tools?
13. What are economical tools?
14. what are geography tools?
15. What are political science tools?
16. What are psychology tools?
17. What are sociology tools?
18. What are social work tools?
19. What are biology tools?
20. What are chemistry tools?
21. What are earth science tools?
22. What are space science tools?
23. What are physics tools?
24. What are computer science tools?
25. What are mathematics tools?
26. What are agriculture tools?
27. What are architecture and design tools?
28. What are business tools?
29. What are divinity tools?
30. What are education tools?
31. What are engineering tools?

32. What are technological tools?
33. What are environmental and forestry tools?
34. What are family and consumer science tools?
35. What are human physical performance and recreation tools?
36. What are journalism tools?
37. What are media studies and communication tools?
38. What are library and museum studies?
39. What are medicine and health tools?
40. What are military science tools?
41. What are public administration tools?
42. What are social work tools?
43. What are transportation tools?
44. What are financial tools?
45. What are managerial tools?
46. What are the accounting tools?
47. What are financial advisor tools?
48. What are the financial analyst tools?

Rule 23-Did the author, writer, representative, speaker, researcher talked with both sides?

1. Follow the money.
2. History Tends to repeat. Always try to understand historical facts and build on that understanding of the history.
3. Do not fear objective facts and evidence, even if the facts goes against your arguments, which then you drop if goes against the facts. This helps to understand the context, narrative and see who is manipulating those facts and lying. This helps to understand how the world works and how different things has happened and what history tells you overall. When you know the truth it helps to move on. The truth shall set you free. Always investigate both sides and try to understand their facts, arguments, evidence, who is lying, manipulating, why they do this, who is behind this, what is their purpose, what are they gain from this. Check people background, family history. Do the research always yourself, listen both sides and see the objective facts, how they presenting, why they presenting. Never manipulate information, facts, evidence, and Numbers.
4. Watch What They Do and Not What they talk.
5. Do the diagram how it relates to each other
6. Why has author, presenter, researcher, speaker, representative decide to take this topic or theme to analyse, investigate, talk, write, report, present?
7. Does the author is related to one of the side? Does the author will take one side or both sides to analyse the situation?
8. Does the author talk to one side or both sides to analyse the situation?
9. Does the author, presenter, researcher, speaker, representative do this investigation to push agenda, narrative or story to one side or the other? Is the author objectively allow both sides to speak and present both sides of the story to get full picture?
10. Does the author, presenter, researcher, speaker, representative try to deceive audience? What method does she, he use to deceive?
11. Is the author, presenter, researcher, speaker, representative selective or being selective in:
 - I. Presenting sides
 - II. Presenting facts
 - III. Presenting Historical Facts
 - IV. Presenting evidence
 - V. Presenting argument.

Rule 24-Did the author, writer, representative, speaker, researcher selective and non selective information of the story?

1. Why is the author, presenter, researcher, speaker, representative is so selective or non-selective in the story?
2. Does the author, presenter, researcher, speaker, representative use propaganda in this investigation?
3. Does the author, presenter, researcher, speaker, representative break law in this investigation?
4. Does the author, presenter, researcher, speaker, representative tries to make:
 - I. Emotional conclusion
 - II. Deceiving conclusion
 - III. Not fully informative conclusion
 - IV. Informative conclusion
 - V. Truthful conclusion
 - VI. Brainwashed conclusion
 - VII. Propaganda conclusion
 - VIII. Selective conclusion
 - IX. Realistic conclusion
 - X. Wrong conclusion

Rule 25-Did the author, writer, representative, speaker, researcher manipulating information?

1. Who id manipulating information?
2. Who is manipulating facts?
3. Who is manipulating people to behave one way or the other?
4. Who is manipulating people do this is sort of things?
5. By changing the law, whom this will be most useful and valued?
6. What interested group this will be most useful and whom this will be least useful and valued?
7. By introducing new tax or add more tax and citizens needs to pay more for tax, whom this tax reform or add tax is most useful or valued?
8. Who would win in this situation?
9. What interested group this tax reform is least useful? Who will loose in this situation? What interested group this tax is least valued?
10. What interest group this politician, scientist, author, speaker, government official, military official or other group of people represent?
11. How much does get for this representation? Any gift, money other type of reward?
12. Is this politician, scientist, military official, government official or other group of people corrupt? Why do I think he, she corrupt? Why do I think he, she is not corrupt? What are the facts, evidence and arguments
13. When presented the story or narrative or article or research, does one side:
 - I. Make deceitful comments about other side? Does one side misrepresent the other side? Does both side provide full truthful, deceitful information? What was deceitful, truthful
 - II. What signs show that they told truth, deceive.
 - III. Facts
 - IV. Dates
 - V. Body language
 - VI. Eyes
 - VII.The way they said
 - VIII.Emotions
 - IX. Behavior

Rule 26-Did the author, writer, representative, speaker, researcher representing interested party or group

1. What interested party does the writer, author, researcher, speaker, representative represent
2. Does this conflict of interest?
 - I. Does the author, writer, researcher, speaker representative presents both sides?
 - II. Why they represent this specific interested party or group
 - III. Do they get paid?
 - IV. Who financed?
 - V. What figure or people behind this
 - VI. Follow the money?
 - VII. Follow the people or main player or figure behind the money
3. Follow power and the main figure or player behind all of this power? Why are they in-charge?
4. What is their end place or target and what is their end result?
5. Why are they going there?
6. What is the reason?
7. What is their psychological portrait?
8. What psychological issues do they have?

Rule 27-Who is behind the Chaos?

1. Who sponsor-what amount?
2. Why they sponsor?
3. Who are interested party or groups
4. Who are the main figure behind sponsoring?
5. Who are the minor figure behind sponsoring
6. Who are the main and minor figures in the group?
7. What end result do the sponsor wants?
8. What end result do the group wants?
9. Why is this end result?
10. Who behind those people?
11. Who is the shot caller
12. Is this group organised or not?
13. Who is the people power?
14. Do they want more power?
15. Do they do for the power grab?
16. Are they for money, power or both or good cause or greed?
17. What is in their heart
18. What is the main problem? Is it sin and depravity?

Rule 27a-Who is Shadow Government Like, Blackrock, Vanguard, State Street, other Banks, Asset Management etc?**Rule 27b-Who is the shadow person?**

Rule 28-Deceiving, truth and Lie

1. Does the author, researcher, speaker, writer, representative intentionally or unintentionally deceiving the author?
 - I. What is up to author, researcher, speaker, writer, representative and what does she, he receives?
 - II. What does she, he received? Money or other reward?
 - III. Does the author, researcher, speaker, writer, representative receives some smaller sentence?
 - IV. Does she, he believes what himself, herself saying?
 - V. Does the author, researcher, speaker, writer, representative says because of reward?
 - VI. Is thus the best what author can provide? In regard facts, arguments, dates, people, other information?
2. How do we know that this is true or lie? Based on what?
3. Do we have witness?
4. Do the witness tell a lie?
5. Do the witness tell a truth?
6. How do we know that the witness tell the truth or lie? What are evidence of lie or truth?
7. What is the reason of lie or truth?
8. What do they gain or loose by tell truth or lie?
9. Does the witness use selective info to present? Why does the witness do?
10. Does author, writer, researcher, speaker representative use selective information to present the argument case for? What info does the author did not include which would reduce strength of argument or case?
11. Does the author represent on side? Why? What are reason does the author suppress other side?
12. Does the author represent both sides equally? Why? What reason? If not, why not?

Rule 29-Definition change

1. Was there definition changed to fit the narrative of corporation, group of interested people, government, elite or somebody else?
2. When was changed?
3. Was there theory changed to fit narrative corporation, group of interested people, government, elite or somebody else?

Rule 30-Interested groups

1. How this information being used by newspaper, interested groups, oligarchs and other groups of people
2. What information is being useful for ideological, religious, political, cultural, financial or other agenda?
3. Is this information is pressure to censor freedom of speech, movement one or the other groups?
4. Who funded this person, newspaper, speaker, groups of people or interested groups?
5. What is the reason they have funded these groups?
6. What is their agenda by funded these groups?
7. At what angle the author, newspaper or interested groups showing this information? Why they have showed at this angle and why?
8. Does the author, speaker or interested group do what she, he, they talked? How did they show this? How they did not show this?
9. Does the character does what she, he, they said they will do?
10. What is the ideological, political, cultural, financial, religious agenda of the interested party or groups?
11. Did the author selected who she/they will present the information first?
12. Did the author selected newspaper, journalists or group of interested people who will be presented this information for some sort of agenda?
13. Why did she, he, they choose this group of people to reveal information? What is the person agenda? What is the group interested agenda?
14. What are the interested groups? Make a list of the interested groups? What are the signs and features of those particular groups
15. Does the author, speaker, journalist, activist, writer, academic belongs to one of the interested group?
16. Does the audience belongs to the particular groups? What are the signs and features of particular group?
17. Follow the money? Where does the money flow from? What group of interested are funding? Do the interested group hid the money and secretly funding those groups?
18. What are the list of interested groups are ruling?
19. What are the capital groups? Who do they funding? What groups do they fund? Make a list. Why do they fund these groups? Make a list of reasons

20. Is there any trolls? What are their agenda? Who do they belong to? What group do they represent? Are they paid trolls? What country, city, age, education, marital status? How much do they receive from this work?
21. Was the information manipulated or twisted to fit the narrative of one of the interested groups? What capital group this group belongs?
22. What group this situation is the most useful? Make a list of interest groups
23. What group this situation is the least useful? Make a list of interest groups

Rule 31-List of Interested groups and parties

1. Watch What They Do and Not What they talk.
2. What is the current political, government ruling? Dictatorship, democratic, communism, socialism, monarchism, authoritarian, Oligarchy, aristocracy, theocracy, colonialism, totalitarianism, military dictatorship, anarchy, confederation, unitary state, federation, autocracy, democracy, direct democracy, electoracy, liberal democracy, liquid democracy, representative democracy, social democracy, soviet democracy, totalitarian democracy
3. Abortion
4. Agriculture and Food
5. Animals and wildlife
6. Arts
7. Entertainment
8. History
9. Budget
10. Spending
11. taxes
12. Business and consumers
13. Corporations
14. Capital
15. Campaign finance
16. Civil Liberties
17. Civil Rights
18. Constitution
19. Criminal Justice and death penalty
20. Defence and military.

21. Military industry Complex
22. Biggest Companies
23. Asset Management Companies
24. Drug and cartels
25. Economy, and fiscal
26. Education
27. Election
28. Employment and affirmative action
29. Entitlement and safety net
30. Family
31. Federal relation
32. State and local relations
33. Banking and finance and wall street
34. Fiscally conservative
35. Fiscally liberal
36. Food processing and sakes
37. Financial capital
38. Wall Street
39. economic interests
40. cause groups
41. public interests
42. private and public institutional interests
43. Political power in the political system
44. Non-associational groups and interests.
45. government policy makers and well-financed as prime movers in interest-group activity
and policy making
46. Neo-corporatism
47. Corporatism and corporation
48. Lobbyist and tactics
49. Multinational corporation
50. Transnational corporation
51. Global corporation
52. Groups that have capital
53. Religious groups
54. Sects

55. Occults
56. Worship groups
57. Foreign affair
58. Foreign countries
59. Foreign aid
60. Gambling and gaming industry
61. Government budget and spending
62. Political party
63. lobbyist
64. Government operation
65. Guns
66. Health and health care
67. Big Pharma
68. Scientist
69. Insurance
70. Health insurance

81. Labor union
82. Union groups
83. legal
84. Legislative branch
85. Politician
86. Liberal
87. Marijuana
88. Marriage
89. Military and militarization groups

- 90. Minors and children
- 91. National security
- 92. Natural Resources
- 93. Oil and Gas industries
- 94. Religion
- 95. Reproduction
- 96. Science and research and academy and universities
- 97. Senior citizens
- 98. LGBT
- 99. SOCIAL
- 100. SOCIALLY CONSERVATIVE
- 101. Socially liberal
- 102. Taxes
- 103. Technology, social media communication
- 104. Mass media and communication
- 105. Taxes
- 106. Trade union
- 107. Trade
- 108. Transportation
- 109. Unemployment and low income
- 110. Veterans
- 111. Woman and man
- 112. Any other interested groups are out there?
- 113. Suppliers
- 114. Customers
- 115. Partners
- 116. Employees
- 117. Investors
- 118. Owners
- 119. Bankers
- 120. Regulatory bodies
- 121. Unions
- 122. Competitors

123.Society

124.Opposing pressure groups

125.Internal interested party examples:

- I. Management
- II. Employees
- III. Corporate
- IV. Owners

126.External interested party examples:

- I. Customers
- II. Suppliers
- III. Community
- IV. Bankers
- V. Investors
- Regulators
- VI. Unions
- VII. Trade Associations
- VIII. Utilities
- IX. Law Enforcement
- X. Society
- XI. Intellectual Property Owners
- XII. Joint Venture Partners
- XIII. Business Partners
- XIV. Emergency Responders
- XV. Industry Groups
- XVI. Special Interest Groups
- XVII. News Media
- XVIII. Competitors
- XIX. Consider these *six market categories* when identifying interested parties:

127. Customer: buyers, consumers, clients, end users, and retailers.

128. Supplier: producers, vendors, contractors, and distributors.

129. Intermediary: referral sources, connectors, agencies, and networks.

130. Influencer: financial markets, regulatory markets, and government.
131. Internal: employees, staff, managers, and business units
132. Alliance: joint ventures and business partners
133. **Responsibility** – investors, etc.
134. **Influence** – pressure groups, etc.
135. **Proximity** – neighbours, etc.
136. **Dependency** – employees, etc.
137. **Representation** – trade unions, etc.
138. **Authority** – regulators, etc
139. Foreign [governments](#) and [international organizations](#). Countries maintain a wide array of embassies and consulates in foreign countries, and they often use these and hired lobbyists to work for such benefits as [foreign aid](#) and military support, as well as to boost the country's image abroad. International organizations (e.g., [UNESCO](#), [Asia-Pacific Economic Cooperation](#), the [Arab League](#), and the [Organization of American States](#)) use their resources in manners similar to governments.
140. [Multinational corporations](#) (e.g., [McDonald's](#), [Coca-Cola](#), [Honda](#), [Volvo](#), and) and business trade associations (e.g., the International Chamber of Commerce and the European Association of Manufacturers of Business Machines and Information Technology). These often have extensive global or regional reach. Their major concerns in lobbying relate to similar issues that they have within individual countries and include ensuring favourable labour codes and tax structures, making trade as free as possible, ensuring favourable laws regarding government regulation of their product (e.g., food and drink) or service (e.g., telecommunications), and trying to minimize added costs such as those involving environmental regulations. Because of their extensive resources and the fact that the government relies on the economic advantages provided by these multinational corporations, they are often successful in achieving their lobbying goals.
141. Special interest and [cause groups](#). These include the [World Council of Churches](#), the [Baptist World Alliance](#), the [Anglican Communion](#), international networks of LGBTQ-rights groups, and the Inuit Circumpolar Conference, an organization

of indigenous peoples of the Arctic and subarctic regions of [North America](#), Europe, and Asia. Such groups and organizations are involved in international lobbying for a variety of reasons and with mixed success. Some, such as churches, often lobby simply for the right to operate in a country and on behalf of human and [civil rights](#) and the poor. Others, such as indigenous groups, lobby for the rights of their compatriots in terms of preserving their customs and language and repatriating artifacts that may have been taken to other countries and are now housed in museums around the world (particularly in countries that were former colonizers).

142. International public interest groups ([nongovernmental organizations](#) [NGOs]). NGOs embrace a wide range of groups that focus on issues of broad public concern, such as human rights, [child welfare](#), and the status of women, as opposed to the specific interests of particular businesses or sectors of society, such as automobile manufacturers and physicians. At the meeting in 1945 in [San Francisco](#) that drew up the UN charter, some 1,200 NGOs were in attendance. Though there is no current, reliable count of NGOs, they mushroomed in the period after World War II and may number as many as 10,000; in [Latin America](#) alone it is estimated that there are some 2,000 NGOs, many of which work in several countries. Significant among the multitude of NGOs operating in world politics today are [Human Rights Watch](#), [Oxfam International](#), [CARE](#), [Greenpeace](#), the [World Wide Fund for Nature](#), and the [Women's International League for Peace and Freedom](#). NGOs enjoy mixed success in their political activities, partly because governments rarely rely on these groups to maintain themselves in office. Most operate far from public view, and their successes may receive little publicity. Some, however, such as Greenpeace, receive major publicity for their campaigns.

Rule 32- Who Will Use This Situation

- A. Who is the person/organisation or group that this situation is the most useful?
- B. Who is the person/organisation or group that this situation is least useful?
- C. Did the author used all AVAILABLE SOURCES, INFORMATION, FACTS AND ARGUMENTS TO HIM/HER.
- D. Does the author trying to rewrite facts, information, history of the subject to fit his/her arguments and situation?
- E. Did the author do honest analysis of all available sources, information, arguments, evidence and facts?
- F. Whom this situation is the most useful?
- G. Whom this situation is the least useful?
- H. Who is the winner of this situation?
- I. Who is the loser of this situation?
- J. Who is the victim in this situation?
- K. Who is not the victim in this situation?
- L. Who is the most likely used this situation to his/her/their advantage?
- M. Who is the least likely used this situation to his/her/their advantage?
- N. Who got harm in this situation?
- O. Who did not get harm in this situation?
- P. Almost at the end ask questions about the funds provided to the author, presenter, researcher, speaker, publisher and find out about the source of the funds provided. This is the outside research needs to be done. Follow the money.
- Q. Who or what is the most influenced in this situation?
- R. What are the corruption scheme in this situation/government, company, person or group of people?
- S. What are the corruption diagrams in this situation by government, company, person or group of people?
- T. Who is at fault in this situation?
- U. Who is not at fault in this situation?
- V. Who funded this whole scheme and situation?
- W. Where the funds came from?
- X. Where the funds where? Who received the funds?
- Y. Was this legal scheme?

Z. Is the current situation or crisis or breaking news is there to cover something bigger behind? Like trying to pass new laws or corruption or purchase which are illegal. What are these things that been tried to hid behind big news. Research everything?

AA.Who losing the most in this situation?

BB.Who is losing least in this situation?

CC.Who is winning the most in this situation

DD.Who is the winning least in this situation?

EE.Does the person tried to incorrectly paraphrase the arguments or facts or evidence?

FF.Is there conflict of interest between these two parties?

GG.Who is the breaking conflict of interest?

HH.Was there are any Break a law, code of, GDPR?

II. Was there any hidden in the accounting? What was hidden? What was tried to be hidden? Why was hidden?

JJ. What or who the person tried to protect?

KK.Was there any motivation behind some of the actions?

LL.What was the motivation behind these actions?

MM.What are the mathematical formulas behind?

NN.What are the flow chart of decision. What would be outcome if they would decide one way or the other?

OO.Was the person who speaking, presenting, author, researcher representing other side correctly and honestly?

PP.Was the speaker, presenter, author and researcher were paid by somebody to do the propaganda and throw the dirt on other people?

QQ.Was there any propaganda used in the speech, research, book or article so that they/ he/ she advising about other side incorrectly?

RR.Did I use evidence, facts and sources for every argument, premise, conclusion and sentence?

SS.Did the other side used sources, facts, evidence for every sentence, premise, argument and conclusion?

TT.Did the analogies are correct?

UU.Did the analogies really represent other side or my side?

VV.What type of arguments presented by other side?

WW.Was other side used epithets about other side? Was this is logical fallacy? Did I use the epithets? Did the other side understand this epithets? Why did they think this was

appropriate way or time to say this? Was this what other person think? Was this objectively true or not? Was this breaking any law?

XX.Does the other side understand the definition of this term?

YY.Was this is a troll who is not looking to get the correct information, but troll others and me?

ZZ.Is this person looking appropriate discussion?

AAA.Is this person trying to persuade you appropriately with full information which is correct or incorrect?

BBB.Would you apologise if provided facts and evidence were wrong for the arguments which were lead to wrong conclusion?

CCC.Does the person know or understand that he/she/they are wrong or right?

DDD.Why they they think they are right?

EEE.Why they think they are wrong?

FFF.How do we know that this happened exactly the way he said? Do we have facts? Evidence?

GGG.Use **What, who, why, when, where, how, do , did, can, may do not, did not, cannot may not, might, might not, does, does not.**

HHH.Does the person has the education to speak about this subject?

III. Does the person has honestly went through the criticism of the opposing ideas? Did the person found the reason he opposing to the other person?

JJJ.Does the person have serious intention to confuse audience?

KKK.How well does the person do the job to confuse the audience?

LLL.Did the person introduced new terms or arguments?

MMM.Did the other person did a good job to research his her ideas and opposing person ideas?

NNN.What is the reason the person trying to confuse audience?

OOO.What propaganda tools did the author, speaker, writer used in analysing this idea and opposing person idea?

PPP.Did the person understood or understand that he used propaganda tools.

QQQ.What sources did the other person used in analysing opposing person arguments?

Rule 32- Do Research archeology on the Book.

Rule 33- Do Research Geography.

Rule 34- Cultural Practice.

Rule 35. Legal Analysis of the Book.

Rule 36- Literature Review.

Rule 37- Mathematical Analysis.

Rule 38- Statistical and Probability Analysis.

Rule 39- Religious Customs.

Rule 40- Rhetorical Analysis.

Rule 41- Engineering Analysis.

Rule 42- Audience Analysis.

Rule 43. Circle of Context analysis.

- Immediate context.
- Book Context.
- Author's Corpus of Writing Context in other books (Where Available).
- Historical Context
- Logical Context
- Rhetorical contexts

Rule 44-Analyse Semantically

Rule 45- Syntax Analysis

Rule 46 Historical Background

Rule 47 Cultural Background

Rule 48 Economic Background

Rule 49 Technological Background

Rule 50 Legal Background

Rule 51 Environmental Background

Rule 52 Social Culture

Rule 53 Philosophy Gap

Rule 54 Theology Gaps

Rule 55 Anthropology Gaps

Rule 56 Political Science Gaps

Rule 57 Psychology Gaps

Rule 58 Sociology Gap

Rule 59 Biology Gap

Rule 60 Chemistry Gaps

Rule 61 Earth Science Gaps

Rule 62 Science Gaps

Rule 63 Physics Gaps

Rule 64 Computer Science Gaps

Rule 65 Mathematical Gaps

Rule 66 Business Gaps

Rule 67 Engineering Gaps

Rule 68 Medicine and Health Gaps

Rule 69 Sociological Gap

Rule 70 Anthropological Method

Rule 71 Statistical Method

Rule 72. Who are the experts in this Area, Topic, Discipline. What do The experts say? Do they agree with the author? If yes, why, and if no Why?

Step 47-Was There Propaganda or Conspiracy Theories Or Trust In Science Theories. In the Book and Propaganda Analysis.

1. Review the Propaganda of the following:

- Text
- Writing
- Book, Journal, Article, Report.
- Bible
- Sermon
- Dissertation
- Government Documents
- Theses and Dissertation
- Newspaper, Magazines
- Audiobook
- Sermon and Preaching
- Public Speaking
- TV
- Radio
- Podcast
- Communication, Talk. Speak, Conversation, discussion, Debates

2. These are the following books to use for Review and Analysis of Propaganda:

- All Art of Propaganda by George Orwell.
- Computational Propaganda by Samuel Woolley.
- Fake News, Propaganda and plain old lies by Donald Barclay.
- How Propaganda Works by Jason Stanley.
- Propaganda and Persuasion by Garth Jowett.

- **Media, persuasion and Propaganda by Marshall Soules.**
- **Primetime Propaganda by Ben Shapiro.**
- **Propaganda Studies by Jonathan Auerbach.**

3. Do Lateral Reading:

- **Question & Research Task** We know not to believe everything we hear, but what about what we read? What about what we see? The online world is full of misinformation: false or inaccurate information, especially that which is intended to deceive. One way to avoid being fooled by misinformation is by practicing lateral reading, a tool used by professional fact checkers. Lateral reading focuses on using many sources to corroborate, or confirm, information, instead of just relying on one authentic looking source. In today's lesson you are going to learn about and practice lateral reading.
- **Information Sources** Now it's time to learn more about lateral reading and investigate some sources using this technique.
 - What is lateral reading?
 - How do we do it, and why is it important? Use paper or a word processing document to answer these questions as you review the sources below and on the right.
 - The ART of Reading Laterally
 - Stanford scholars observe 'experts' to see how they evaluate the credibility of information online
 - Students Fall for Misinformation Online. Is Teaching Them to Read Like Fact Checkers the Solution?
- **Student Activity** Use your new knowledge about reading laterally to analyze the truth and accuracy of at least three of these sources.
- **Assessment Activity.** Now that you're an expert on lateral reading, it's time to share what you've learned! Imagine your principal has asked you to prepare a brief (two paragraph) article for the school's website about lateral reading. The purpose of the article is to persuade your classmates to use lateral reading in their own research. Your article should answer our inquiry question: "How can lateral reading help you avoid being fooled by fake information online?" Use your research and analysis from class today as evidence for your article. Use the success criteria on this rubric to self-assess your work.
- 2. Don't forget to take the Lateral Reading Schoology Quiz as assigned by your teacher or librarian to show what you've learned about lateral reading.
- **Open A New Tab in Your Browser.**
- **Search The Name of the Unfamiliar Source.**
- **Check What Trustworthy Sites say about it**

- If the Source Seems Untrustworthy, Don't Waste Your Time On IT. Find A Better Source.
- **Check for previous work:** Look around to see whether someone else has already fact-checked the claim or provided a synthesis of research. [Some places to look: [Wikipedia](#), [Snopes](#), [Politifact](#) and NPR's own [Fact Check](#) website.]
- **Go upstream to the source:** Most Web content is not original. Get to the original source to understand the trustworthiness of the information. Is it a reputable scientific journal? Is there an original news media account from a well-known outlet? If that is not immediately apparent, then move to step 3.
- **Read laterally:** Once you get to the source of a claim, read what other people say about the source (publication, author, etc.). **The truth is in the network.**
- **Circle back:** If you get lost or hit dead ends or find yourself going down a rabbit hole, back up and start over.

4. Best Way Fighting with Disinformation and misinformation are the following:

A. What Does the Information Provides, Use Star Method

- Situation- What the information given?
- Task- Does the information describe the task and responsibility?
- Action-does information explains exactly the steps
- Result- What is the result?

B. Use Questions:

- Who? What? When? Where? Why?
- How?
- Can? Could?
- Would? Should?
- Do or Does
- Has or have?

C. Always question even the most obvious.

D. Has this information passed three filters?

- First Filter is that of truth. Are you completely sure that, what information is going to tell me is true in all its aspects?
- Second Filter is that of Goodness. Is what you are going to tell me something good or beneficial?
- Third filter is necessity. Is it necessary for you to tell me this about my friend?
- If it's not true, nor good, nor necessary, then it does not deserve to be heard.

- E. Was there used photoshop, Filters or any other changes?
- F. Was This AI Generated Propaganda?
- G. Always ask Questions Using Socratic Method and Questioning
- H. Understand that Facts do not care about your feeling
- I. Do the Fact Checking, Do the figure check and Verification of the Data.
- J. Is this data from reputable source? Why do you think even reputable source can be trusted and rely on?
- K. Can I check this information on another media platform?
- L. Has the information provided evidence and robust investigation rather fabricated ideas that intrigue?
- M. Was this witnessed by more than 1 person? How do you know that the witnesses are not lying, and Not CONSPIRE Against?
- N. Does the information contradict with other information? Where does the contradictory occurs? How can we know that one side and the other side is telling the truth?
- O. Was there any inconsistencies? Inconsistency is a failed argument.
- P. Has anybody verified and fact and figure checked already?
- Q. Has there been two opposite experience, and how to validate both? Why should I rely on one person experience and not on the other person experience?
- R. Do not share information without thinking
- S. Was there enough information out there to gather information to make some sort of conclusion?
- T. Was information hidden by one group of people? If yes, then why was this hidden? Why do they think, we should not have this information?
- U. Has there been debate between two side of experts who disagree on these issues? Have they had any official debate? Who provided more logical and common sensical arguments, Conclusions and evidences based on the all available information?
- V. If there was no debate, why was this? Which side did not want to participate?
- W. Was there any censorship on this information? why was this censored? Who was responsible for censorship?
- X. Does anybody trying to prevent you to make a decision for yourself? Why is that? What ways they are preventing for you to get this information?
- Y. Do the one or other side care about the truth? What is their agenda?

Z. Do One of the side wants honest conversation and debate? Use Rhetoric, William Lane Craig, Greg Koukl, Aristotle, Socratic Method, Plato dialogue And Socratic Questioning ETC. Pages 323-338 and 1423-1455 and 1599-1641

AA. Who had gain for censoring this information?

BB. Believe should be based on the objective facts, logic, Reason, Evidence. Does the Premises leads to the conclusion or not? Do the reasoning align with the reality. Does the world works and align with the reality.

CC. Add The William Lane Craig method on top regarding the Debate. William Lane Craig Debate Method is on Rules of Reading Page 323-338 and 1423-1455.

Conspiracy Theories.

1. What?
2. Who?
3. Where?
4. When?
5. Why?
6. How?
7. Analyse the Conspiracy Theory by Eric Weinstein:

A. Rule 1-One should not attempt to allege type of conspiracy that has never been encountered before. Over the years many conspiracy has been discovered.

There is a menu of proven conspiracies with which we can figured out whether this conspiracy theory is possible. Ask Yourself The following Questions:

- I. Is it possible that mainstream media can be weaponised by intelligence agency for the purpose of destroying well know or ordinary person Reputation by planting stories in mainstream media. What are examples of this type of case? Destruction of (Give the name of the Person)?
- II. Does the Governments have ability by using intelligence agency to make sure the person is gone from this earth for doing something good?
- III. Can you have a highly coordinated silent hit with tremendous complexity going off almost without a hitch?
- IV. Is it possible that a person was suicided by intelligence agency by let them know that they will turn their live into living hell, as the person thinking commuting suicide is the only way out?
- V. Was there any time when intelligence agency contemplating examine using organize crime in order to carry out act that they did not want to do themselves?
- VI. Would have every had that intelligence agency used party or honey pots and trap with elaborately constructed backstory in which an actor and the character that they played are completely different? Example of this Elis Kone.
- VII. Is there intelligence community interesting to control the media. Example mockingbird.
- VIII. Is there any attempt to gain control of innocent influencers. Are there any circumstances in which people simply have a crime by being influential used against them?

B. Rule 2- Is there a possibility of this Conspiracy theory in reality?

8. Does The Conspiracy theory Has a ground in reality?
9. Always ask central questions is there any government or intelligence agency involved in this case or situation?
10. Who pulling the strings?
11. Was there any documents that are important in this situation or Case? Are those documents are classified or open source, like trading documents, invoices, emails, contracts or any other important documents.
12. What is the structure in this situation and case?
13. What is the time line of this situation or case?
14. Was the person/people or the company or government has spending like billionaire? Do they have a mean to do it?
15. What is behaviour pattern of the person, people or company, government or any other entity in one group or other group.
16. Was there any media interest in this case? If yes or No, then why was or was not?
17. Have these groups somehow connected to each other?
18. Have one of the person, people group gave interview? What has been said and why this been said this way but not the other way in this situation or case or for this situation or for those case?
19. What does the person, company, corporation group of people wanted message to be in the interview?

Trust In Science Theories.

1. What?
2. Who?
3. Where?
4. When?
5. Why?
6. How?
7. Does the claim made by author suggest the trust in science that is called scientism?
8. Does the author states that science is only way to truth or only option for rational thinking person and everything is fairy stories?
9. Was there push to believe that Science is only answer to everything without providing any evidence?
10. Are the person who says trust in science thinks that the one who does not trust are unreasonable morally deficient?
11. Does the person think that the science is a new saviour?
12. Does the person understand limitation of Science?
13. Can the person that trust fully in science answer the following questions?
 - A. Who Am I?
 - B. Where Do I come From?
 - C. Where am I going to?
 - D. What is the meaning of life?
 - E. Where do I get moral Compass
14. What are the science limitation?
15. Where does the Scientism leads to?
16. Does the person promotes Naturalism? The nature that it is?

Step 48-What Did I take From the Book.

A. Read or listen 25min and 5min break

- Read or Listen 20 pages an Hour according Mortimer Adler

B. Read or Listen between 1-50 times the book

C. Speed of Audiobook

- Analysing audiobook listen between 75 words per minute to 285 words per minute
or listen between 0.5-1.9 times speed

D. What did I read?

E. What did it mean to me?

F. What characters, stories or ideas from this book most stood out to you?

G. What character can you connect with the most in the book? Why?

H. Does this character reminds me of somebody I know?

I. Which part of the book am I having the most difficult understanding or connect with?
Why do I think this is?

J. What was most surprising, intriguing or challenging to you about this book?

K. What are the next steps for you after reading this book? What would you like to do,
read, or learn more about?

L. What were some of the differences between this book and the books you typically
read?

M. What did I learn from this book? What will you take from this book moving forward?

N. How do themes and ideas from this book relate to things you are learning in and out of
the classroom?

O. What questions do I have about the book I read?

P. What event did I attend and why did I choose it?

Q. Describe the event. What did you learn from it? What was most surprising or interesting
to you about the event?

R. What are the next steps for you after attending this event? What would you like to do,
read, or learn more about?

S. Non-Fiction Reflection questions

1. While you were reading today, describe what you pictured in your mind about the story.
2. Which character can you connect with the most in your book? Why?

3. This character reminds me of somebody I know.
4. Which part of your book are you having the most difficulty understanding or connecting with? Why do you think this is?
5. What have you done that is similar to what the characters experience in your book
6. How does the part that you read today fit together with the parts that you read earlier?
7. Predict what will happen in the next few chapters/remainder of the book. Support your prediction with facts/quotes from the story.
8. Based on what the characters say or do, what can you infer about their attributes/personalities?
9. Describe the setting. What is its significance to the story? How would the story be different in a different time or place?
10. What motivates the protagonist (main character)? How do you know? Use evidence from the book to support your answer.
11. What are the major obstacles that your protagonist faces? Explain why you think these are most important.
12. Write a letter from one character to another. Be sure to use two quotes from the text within the letter.
13. Create a diary entry in the voice of a character. Be sure to use two quotes from the text within your entry.
14. Find a quote that stands out to you and explain why you chose it.
15. Choose a character from this chapter. What do you like the most or the least about them? Why?
16. How realistic is the plot of your book?
17. Find some interesting dialogue. Explain what is happening between the characters involved.
18. If you could "jump" into your book right now, what would you do in the story and why?
19. Which character would you like to have as a friend and why?
20. Which part of the story caused the strongest feelings in you? Why?
21. I wonder what this part means
22. This part is very realistic/unrealistic because.
23. The character I most admire is....because
24. I love the way

25. I can't believe that
26. If I were, I would
27. I'm not sure that ...
28. I like the way the author
29. I felt sad/elated/apprehensive when
30. My favourite part of the book so far is
31. This part of the story reminds me of (another title) because
32. What were your feelings after reading the opening chapter of this book?
33. Did this book make you laugh? Cry? Cringe? Smile? Cheer? Explain.
34. What connections are there between the book and your life? Explain.
35. What is the most important event in the book? Explain.
36. Who should or shouldn't read this book? Why?
37. What are the best parts of the book? Why?
38. What are the worst parts? Why?
39. Do you like the ending of the book? Why or why not? Do you think there is more to tell? What do you think should happen next?
40. What came as a surprise in the book? Why?
41. What parts of the book seem most believable or unbelievable? Why?
42. What makes you wonder in this book?
43. What confuses you in the book?
44. In what ways are you like any of the characters? Explain.
45. Do any of the characters remind you of friends, family members, or classmates? Explain.
46. Which character would you like to be in this book? Why?
47. What would you and your favourite character talk about in a conversation? Begin the conversation.
48. Do you think the title fits the book? Why or why not?
49. What do you know now that you didn't know before?
50. What questions in this book would you like answered?
51. What do I think will happen next?
52. What are some words I don't know or questions I have?
53. What does the writer's purpose seem to be?
54. My favourite character is because....
55. I can relate to....
56. If I were the author, I'd change....

57. Something that doesn't make sense about this story is...
58. What I think will happen next is....
59. If I were (character in story), I'd....
60. I believe the author wants the reader to....
61. Something unrealistic or too coincidental in the story is....
62. My favourite sentence so far is because....
63. The most important character is because...
64. Write a poem from a character's viewpoint
65. Write a poem about the setting.
66. Write a poem about a character.
67. If you could be related to a character, who would it be and why?
68. Write a solution for a problem a character has that is different from anything suggested in the book.
69. In the sequel to this book, the following should happen....
70. Choose a food that represents this book and explain why.
71. Create a theme song with lyrics for the book.
72. Write a letter to the author of your book.
73. Choose a character and decide what would be two appropriate birthday presents for that character and explain why.
74. What type of reader would enjoy this book and why?
75. This book has made me reconsider or think twice about ... because....
76. Discuss a conflict in the book that is "timeless" and "universal."
77. If I could step into the book, the first thing I would do is....
78. I can't understand why (character) doesn't just
79. I laughed aloud when....
80. I felt like crying when....
81. I was furious when....
82. I was surprised when.....
83. This book reminds me of the fairy tale _____because...
84. If I were making this book into a movie, the part(s) I would cut out or change would be...because...
85. Create a cluster showing the interrelationships of the characters.
86. Discuss how (character) shows his/her personality through the dialogue in the story.
87. Discuss how (character) shows his/her personality by the actions he/she takes.

88. Discuss how (character) shows his/her personality by what other characters say or do toward this character.
89. Create an award for this book. Explain the award and why this book received it

T. Non Fiction questions

1. Which part of the book are you having the most difficulty understanding or connecting with? Why do you think this is?
2. How does the part you read today connect with what you already knew about the topic?
3. Find a quote that is interesting to you and explain why you chose it.
4. I can't believe that
5. My favourite part of the book so far is
6. Who should or shouldn't read this book and why?
7. What do you know now that you didn't know before?
8. What are some words I don't know or some questions I have?
9. I believe that the author wants the reader to
10. Write a letter to the author of this book.
11. This book has made me think twice about
12. Create an award for this book. Explain the award and why this book received it.
13. Now that I've read this book, I want to learn more about
14. I used to think, but now I know
15. I got off track in reading whenbecause
16. Describe a part you had to read twice and why.
17. I've always wanted to learn more about
18. A career in which I could use this information would be
19. Does the content in the book affect your life? How so?
20. What solutions does the author propose? Do you agree with them and why?
21. What text features does the author include? Which ones were of particular help to you in reading the book?
22. Of the information you learned, what would you like to share with someone else?
23. What kind of research do you think this author had to do in order to write this book?
24. Which questions would you ask the author if you had the chance to meet him/her?
25. Would the book be different if it had been written 10 years ago? Why or why not?

26. Did you discover anything that may help you outside of school?
27. Who is the author? What are the author's credentials and how reputable is the author?
28. What inferences are you expected to make when you read this book?
29. What are the implications of this issue?
30. Is there a call to action or a caution within this book?
31. What is the author's intent in writing the book?
32. What are some interesting vocabulary words that you have learned from this book?
33. This book reminded me of
34. If I wrote a book about this topic, I would include
35. The most exciting thing I learned from this book is
36. I would recommend this book tobecause
37. The part of this book I had difficulty understanding is

Step 49-Implication of The Book.

A. Implication

- **What are implication of this?**
- **Implication-process in min implication of the text.**

Step 50-My Arguments For Or Against The Author, Writer, Speaker, Debater.

Rule 1 What Is Your Opinion, Arguments About:

- A. Logic.
- B. Grammar.
- C. hermeneutic.
- D. Book.
- E. Topic.
- F. Authors arguments.
- G. Authors opinion.
- H. Facts.
- I. Evidence.

Rule 2 My analysis and arguments and Objections

- A. Re-read 5 times, my objections to review if I been honest and did not make the following
- B. Think very careful how to answer these objections? Did I correctly understood these objections?
- C. Did I carefully reviewed the arguments and objections
- D. When I criticised the book, topic, authors arguments, authors opinion, facts, logic, grammar hermeneutic. Did I make any Logical fallacies and did I take all things into account?
- E. Did I try my best to criticise fairly the topic or Book or article or speech or Comment by author
- F. Think very careful how to answer these objections? Did I correctly understood these objections?
- G. Did I carefully reviewed the arguments and objections
- H. What is the best way to prepare for response to the objections? Did I checked all my sources and facts that these facts would not be incorrect?
- I. Write the objections which would be very well researched.
- J. Where did the author used incorrect information, statistics, facts or made logical fallacy in presentation, writing, speech, talk, discussion, debate etc.
- K. Did I take the best arguments from opposing side on the topic, book, argument, facts from opposite side
- L. Did I PROVIDE THE BEST arguments against the opposing side and provide: best analysis, did not make any fallacies, honest and in the context analysis, provide correct facts, statistics.
- M. Did I provide date in my arguments?
- N. Were they truthful and honest?
- O. Am I data driven person in providing the arguments?
- P. Am I data driven person in providing and analysing opposite arguments and my own arguments
- Q. Was my arguments were strong or weak?
- R. Did I try my best to be honest with the other opposing side arguments and data? out what ideologies behind these arguments?
- S. Arrange nicely all book
- T. Does the author, presenter, speaker, writer calling opposing person by name to discredit him/her/ them?

- U. Why do they want to discredit?
- V. Did the author used all AVAILABLE SOURCES, INFORMATION, FACTS AND ARGUMENTS TO HIM/HER
- W. Does the author trying to rewrite facts, information, history of the subject to fit his/her arguments and situation?
- X. Do The author provides alternative Worldview to my arguments?
- Y. Do I provide Alternative Worldview to The author arguments?
- Z. Did the author do honest analysis of all available sources, information, arguments, evidence and facts?

Rule 3 Evidence and lead

- 1. Did I allow the evidence to lead whatever it takes?
- 2. Why I have not allowed?
- 3. How do I allow the evidence to lead whatever it takes?

Rule 4 Fit to my Knowledge

- 1. Where does this fit in my knowledge about the topic and the world?
- 2. Where does this fit?
- 3. Does this fill the gap in my knowledge? Or deepen the gap in the knowledge about topic or the world?
- 4. Make a Mind map how this fit to my personal knowledge.
- 5. Make a mind map how this fit to the world knowledge.

Rule 5 Did I Follow the Evidence

- A. Did I follow the evidence where it leads to?
- B. How did I follow the evidence?
- C. Did I Push the goalpost for acceptability farther than at the beginning of the analysis of the topic?

Rule 6 Was there any prediction of the future

- A. Was there any prediction of the future by author, writer, presenter, speaker?
- B. What are the predictions?

Step 51-Improve My Arguments and I would Have Another Chance, how would I Approach.

Where Do I need to Improve on my argumentation

- A. Read More sources?
- B. Listen more different perspectives on the same subject?
- C. Improve my grammar
- D. Improve my logical analysis
- E. Improve my hermeneutical analysis
- F. Improve mathematical logic
- G. Improve mathematical facts
- H. Improve statistical facts
- I. Provide more facts
- J. Provide more evidence
- K. Ask more questions
- L. Use socratic method and questions and tactics in my approach?
- M. Did I represent other side honestly
- N. Did I represent other side argument in full and without any omit information?
- O. Be better in my presentation?
- P. Be better in my body language
- Q. Be better in controlling emotions?
- R. What is the best approach in this situation?
- S. Was I honest in the whole approach?
- T. Was I HONEST IN My analysis?
- U. Did I use all available information, facts and arguments to me, when responding to the objections?

If I WOULD ANOTHER CHANCE, HOW WOULD I Approach

- A. Analyse the argument
- B. Analyse information
- C. Analyse facts
- D. Analyse Evidence
- E. Analyse my arguments to response to the other party
- F. Would there be any change in my response?
- G. What would be differently?
- H. How differently?
- I. How would I approach? Body language, tone, argumentation, facts provision, evidence provision, research tactic- asking questions, Socratic method and questions

Step 52 - Basic Exploration, Experimentation and Practice.

1. Step 1-Basic Exploration, Experimentation and Practice.

- I. The primary goal here is to simply explore based on your instincts without attempting to achieve any particular purpose. The experimentation is obviously with respect to the particular module you are focusing.
- II. If your modules focus on some technology-orientated topic, then in this step you play around with different software to familiarise yourself with these different tools to understand ways in which they functions.
- III. If your topic is something more theoretical, then you would need to ponder what exactly you want to learn about and then form some hypotheses about how those concepts or process manifest themselves, and the best way you can start learning them.
- IV. The goal of this step is to stipulate (demand) our mind to start asking the right questions about our modules. These questions will be most important outcome of this step.
- V. This step entails answering the questions you came up with in the previous step.
- VI. In this steps you will attempt to answer at least some of these questions if not all of them. For this, you would need to revisit the various resources you aggregated earlier and use them to first, answer all the questions you came up. Second to acquire as much knowledge as you can. Continue this process until you believe you have learned enough about this specific module.
- VII. You would need to go back and forth between learning new things and applying them practically to reinforce your newfound knowledge.
- VIII. Split time between learning and practical application.
- IX. Experiment on trial and error.

Step 53 - Note Taking

1. The Blank Sheet

The single biggest change you can make to getting more out of the books you read is using the blank sheet method.

Over the years I've tested multiple approaches and this one works best for simplicity and effectiveness — it will 10x your comprehension overnight.

The blank sheet primes your brain for what you're about to read and shows you what you're learning.

Here's how it works:

1. Before you start reading a new book, take out a blank sheet of paper. Write down what you know about the book / subject you're about to read — a mind map if you will.
2. After you finish a reading session, spend a few minutes adding to the map with a different color.
3. Before you start your next reading session, review the page.
4. When you're done reading, put these 'blank sheets' into a binder that you periodically review.

2. Conventional Notes

Forget the teacher that yelled at you for writing in your book when you were a kid. You bought this thing. It's your property. You need to [write in the margins](#).

Here is a very [simple process to take notes while reading](#):

- At the end of each chapter write a few bullet points that summarize the main idea or specific points. Use your own words and not the authors. Try and connect it to something in your life — a memory or another idea. Also, make note any unanswered questions you had while reading.
- When you're done the book, put it down for a week.
- Pick up the book again and go through all your notes. In a lot of cases, reading your notes will be as good as reading the book again.
- On the inside cover write out the main idea of the book using your own words. If you find yourself stuck, review your notes. (This is called [the Feynman Technique](#)). Writing is the process by which we often discover we don't know what we are talking about.
- You can even make a custom index on the back cover with themes or topics.
- (Optional) Copy out the excerpts by hand and put them on the back of your blank sheet from above or type them out and put them into Evernote. Tag accordingly.

3. Note Taking

- I. Normal note-taking with as much detail as you can.
 - Copy down the information you ordinarily you need to know as you encounter the material.
- II. Summarising the information in your own words, clarifying the significance and noting question.
 - Do not repeat the initial note, even if you took your notes in complete sentences.
 - Converting the note to language that helps you understand the meaning is essential.
 - Try to make connection and find relationship within the information.
 - List any questions you have about the notes you have took in step 1.
- III. Connecting this particular piece of information to the lesson at large.
 - State any connection you can find between the subject of that note and the broader topic you are studying.
 - Is there any cause and effect relationship with broader topic.
- IV. Answering remaining questions and then summarising each distinct page or section again.
 - Revisit, synthesise and transform the information you have learned.

4. Cornell Note Taking

This method of note taking is useful because it enables you to keep track of questions or thoughts that occur to you while making notes. It also allows you to go back and add comments to a page of notes or connect ideas from one source to another.

The Cornell note taking method serves multiple purposes:

- Notes from the lecture or readings, so that you have a record of information you may have forgotten (Details section).
- Summary of what was covered in the lecture or reading which you can easily look through (Summary section).
- A set of key points and/or questions that serve as a mini study guide (Main Ideas section).

Method

During class

- o take down information in largest area of the page.
- o when instructor moves to new point, skip a few lines.

After class

- o complete phrases & sentences as much as possible.
- o for all significant information, write cue in left margin.

After writing the notes in the main space, use the left-hand space to label each idea and detail with a key word or "cue"

An example of Cornell Note taking form is below – blank sample follows.

DATE:

IDEA/ Name of the lecture:

Main Ideas and Questions

Details

Summary of Notes After Class

Homework For Next Week or Months

Important Information For assignment, Exam or Other

5. Richard Feynman Note Talking Technique

- I. Choose a concept and Write At the TOP Page. Select a topic you're interested in learning about and write it at the top of a blank page in a notebook.**
 - A. Write What You do Know About The Topic or Concept. Write what you know, as if you were explaining to yourself.**
 - B. Write What you Do not Know About The Topic or Concept. You need to be specific. Given the accumulated knowledge in the universe, most of us know nothing about most things! Writing down explicitly what you don't know provides you with a starting point.**
 - C. What Book Explains the Best About This Topic.**
 - D. You have to start small. You really only have a page (or a few) to fill up with information. You can't fit everything there is to know about "Evolutionary Science" or "Microeconomics" or "Psychology" on a page. Instead work on smaller more defined concepts or what might reliably be found on a midterm or final exam.**
 - E. Fully understand the complex topic first: Don't begin the learning process by explaining it before you actually understand it. Retention methods such as Feynman technique, active-recall and spaced repetition are for solidifying information that you already understand. Trying to solidify an information before you understand it might end up encoding wrong interpretation of a topic.**
 - F. Actually put the time and effort: Once you have selected the correct set of topics, make sure you actually spend the time and effort to go through the entirety of the techniques. Feynman technique is great for having a basic framework of the topic inside your head with the details chopped off. It's important to get a very clear picture of the basics in your head right - the details can be filled in later.**

G. Make it your own.

- Start with not knowing.
- Ask 'why?'. ask why $x=y$. or why does music has 12 notes and not 14.
- Study the story of what you are studying. E.g. study what was physics before Quantum theory. Why QT was needed, who were the people involved in developing the QT and how it changed the world.

H. Take Notes On the Topic From Study.

- I. Consolidate the information concisely onto a flashcard or some other place for long term retention: Once we really understand a topic to be able to explain the core principles without having to use jargon, we should hold onto that understanding. Unfortunately, a large portion of that information that we just gathered is lost within first 48 hours after learning. So note it down somewhere before you lose it. Optimise for spaced-repetition for next sessions.

J. Don't write notes on notes: Life is short.

II. Simplify The Topic For Myself First.

- A. Simplify your explanation so that YOU understand it. As long as the explanation is not simple enough for YOU to understand, spend more hours to break it down to basic, bare-bone, core ideas.
- B. Avoid jargon and complexity. The simpler the explanation, the more likely you are to remember it.
- C. Only Use Simple Words. The words a child would understand.
- D. Anyone can make a subject complicated but only someone who understands can make it simple. Jargon hides our lack of understanding. When forced to write out an idea from start to finish in simple language, you discover where you struggle, where it doesn't quite make sense, where you get frustrated, where you don't really understand as well as you thought. Only by identifying gaps in your knowledge can you fill them.
- E. But true understanding requires a more active process like *teaching*. Start out by formally teaching yourself. Write out a summary in your own words without looking at your notes. Or explain it to yourself out loud. Then take it to the next level by teaching other people. Teaching also initiates a feedback loop, where critique or questions can help us learn and sharpen our thinking.
- F. **It makes it harder to trick yourself.** When you have to truly explain something, whether through writing or aloud, you encounter the holes in your reasoning and the white spaces in your knowledge. Think of writing and teaching as a process to *obtain understanding*, not something you do once you already understand.

III. Reflect, Refine, and Simplify

- A. Only when you can explain the subject in simple terms do you understand it.
- B. Simple is beautiful.
- C. Review your notes to make sure you didn't mistakenly borrow any jargon or gloss over anything complicated.
- D. Read it out loud as if to a child. If the explanation isn't simple enough or sounds confusing, that's a good indication that you need to reflect and refine.
- E. Go back to the source material, reviewing the parts you don't quite understand yet.
- F. Repeat until you have a simple explanation.

- IV. Teach it to yourself or someone else. Write everything you know about a topic out as if you were explaining it to yourself. Alternately, actually teach it to someone else.**
- V. Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, podcast – and fill the gaps in your knowledge.**
- VI. Simplify your explanations and create analogies. Streamline your notes and explanation, further clarifying the topic until it seems obvious. Additionally, think of analogies that feel intuitive.**
 - A. Every field of study has its own specialised terms. While it may be important to know them, it's also important to not confuse knowing jargon with knowing concepts. The Feynman Technique involves simplifying our initial explanations and refining our understanding through simple analogies..Why this step works:
 - B. Simplicity is a proxy for understanding. It's easy enough to commit terms to memory, and repeat them back when prompted. But memorisation is not understanding. When we can't rely on big words that make us sound smart, we have to distill what we truly know to the most basic form. This is where true understanding takes place.
 - C. Analogies are easier to recall and explain. When you understand a challenging concept, analogies allow you to create a short-hand for recalling it quickly and explaining it to others clearly. Learning material often provides ready-made analogies for us. For example, we all probably have "the mitochondria are the powerhouse of the cell" burned into our collective memories. However, pushing ourselves to create our own analogies is even more powerful than regurgitating a borrowed one that we may not actually understand.

VII. each it to yourself or someone else. Write everything you know about a topic out as if you were explaining it to yourself. Alternately, actually teach it to someone else.

- A. Classic learning mistake is reading an article or textbook and considering our learning complete. In reality, reading is not understanding. We might even take notes, essentially transcribing a resource's sentences into our notebooks. We often nod to ourselves, thinking we've grasped a subject. After all, *we've taken notes*.
- B. Remove any jargon or complexity.
- C. Only Use Simple Words. The words a child would understand.
- D. Anyone can make a subject complicated but only someone who understands can make it simple. Jargon hides our lack of understanding. When forced to write out an idea from start to finish in simple language, you discover where you struggle ... where it doesn't quite make sense ... where you get frustrated ... where you don't really understand as well as you thought. Only by identifying gaps in your knowledge can you fill them.
- E. But true understanding requires a more active process like *teaching*. Start out by formally teaching yourself. Write out a summary in your own words without looking at your notes. Or explain it to yourself out loud. Then take it to the next level by teaching other people. Teaching also initiates a feedback loop, where critique or questions can help us learn and sharpen our thinking.
- F. **It makes it harder to trick yourself.** When you have to truly explain something, whether through writing or aloud, you encounter the holes in your reasoning and the white spaces in your knowledge. Think of writing and teaching as a process to *obtain understanding*, not something you do once you already understand.
- G. **It's even harder to trick others.** If an explanation you're providing doesn't make sense, they'll often tell you or you can pick up cues like blank stares. As a test, ask them to repeat what you taught them in their own words. If they can't do this, your explanation is too complex — simplify it and use plain language.
- H. **You build confidence.** When you truly understand something, it clicks. You can explain it forward and backwards, pointing out exceptions and spotting logical inconsistencies. When this happens, it builds confidence and pushes

you to tackle even more challenging subjects knowing you have a solid framework for learning.

VIII. Reflect, Refine, and Simplify.

- A. Only when you can explain the subject in simple terms do you understand it.**
- B. Simple is beautiful.**
- C. Review your notes to make sure you didn't mistakenly borrow any jargon or gloss over anything complicated.**
- D. Read it out loud as if to a child. If the explanation isn't simple enough or sounds confusing, that's a good indication that you need to reflect and refine.**
- E. Go back to the source material, reviewing the parts you don't quite understand yet.**
- F. Repeat until you have a simple explanation.**

IX. Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, Journal, Newspaper, podcast or any other resource and source – and fill the gaps in your knowledge.

X. Simplify your explanations and create analogies. Streamline your notes and explanation, further clarifying the topic until it seems obvious. Additionally, think of analogies that feel intuitive.

- A. Every field of study has its own specialised terms. While it may be important to know them, it's also important to not confuse knowing jargon with knowing concepts. The Feynman Technique involves simplifying our initial explanations and refining our understanding through simple analogies..Why this step works:
- B. Simplicity is a proxy for understanding. It's easy enough to commit terms to memory, and repeat them back when prompted. But memorisation is not understanding. When we can't rely on big words that make us sound smart, we have to distill what we truly know to the most basic form. This is where true understanding takes place.
- C. Analogies are easier to recall and explain. When you understand a challenging concept, analogies allow you to create a short-hand for recalling it quickly and explaining it to others clearly. Learning material often provides ready-made analogies for us. For example, we all probably have "the mitochondria are the powerhouse of the cell" burned into our collective memories. However, pushing ourselves to create our own analogies is even more powerful than regurgitating a borrowed one that we may not actually understand.

XI. Organize and Review

- A. To test your understanding in the real world, run it by someone else. How effective was your explanation? What questions did they ask? What parts did they get confused about?
- B. When you're happy with your understanding, take the page you created with a simple explanation and put it into a binder. Following this technique for everything you learn gives you a binder full of learning that you can review a couple of times a year.

6. Flow Chart (More for the Debate, Discussion, Dialogue, Conversation and Communication)

A. Take Notes While the Opposition is speaking In Debate, Dialogue, Conversation and Communication:

- How To Take Notes- Flow Chart. By Taking Notes, I am sure that I am responding to my opponent's arguments and everything he brings up.

I. Make 11-12 Columns on the Pad. Prepare the left column in advance of the communication, debate. The Left Column needs to be filled in, if you starting first. If not, then leave left column as blank.

II. First Left Hand Column Are My Arguments.

III. Second Left Hand Column are Opposition Arguments and Responses to My arguments.

IV. Third Left Column are My Responses to the Opponent responses.

V. Fourth Left Hand Column are My Rebuttal.

VI. Fifth Left Hand Column are Opponent Rebuttal.

VII. Sixth Left Hand Column are my Responses to the Opponent rebuttal.

VIII. Seventh Left Hand Column is the Final My Rebuttal.

IX. Eight Left Hand Column is The opponent Rebuttal.

X. Ninth Left Hand Column is my closing statements.

XI. Tenth Left Hand Column is the opponent closing statements.

XII. Eleventh Left Hand Column is the Cross Examination.

- My Answer.
- Opponent Answer.
- My response to the response of the opponent.

7. Use Cornell Note Taking.

- A. Name.**
- B. Date.**
- C. Class and Period.**
- D. Topic.**
- E. Essential Question at the Top of Page.**
- F. Questions and Main Ideas on the Left Page of the Blank Page.**
- G. Notes On the Right Page of the Blank Page.**
- H. Summary at the bottom of the page.**

8. **Analytical Learners: Outline/ List.** Good Works well for recording terms, definitions, facts and sequences.
9. **Sentence Method:** The goal is to jot down your thoughts as quickly as possible. Works well in meetings or lectures that lack organization. Use when information is being presented very quickly.
10. **SQ3R (Survey, Question, Read, Recite, Review).** Use for dense readings (like business books, text books, white papers, etc.). You start the process by skimming the material for bolded text, images, diagrams and summaries in order to produce a list of headlines or main topics.
11. **Mapping.** Mapping is a nonlinear system of note-taking that resembles a tree and root structure. Ideas stem from one major concept and are connected by lines (or “branches”). As a note-taking system, mapping works particularly well for visual learners, but it can also be a great tool for analytical-thinkers who have trouble brainstorming because it allows you to make connections you’d otherwise miss with a linear format. Works well for planning essays, recording meetings. Use for big-picture brainstorming sessions.
12. **Smart Wisdom.** It’s a tool optimised for active listening in lecture situations. Instead of taking notes in full sentences, you record only keywords and place them in a chain that maps the thought process.
13. **Diagram And Processes.** Diagrams help visually represent content. However they are not always versatile. A diagram usually serves one purpose best, so selecting the right diagram will make your notes more meaningful.
14. **Diagram And Processes.** Diagrams help visually represent content. However they are not always versatile. A diagram usually serves one purpose best, so selecting the right diagram will make your notes more meaningful.
15. **Charting.** Charting is a great note-taking strategies when you need to compare and contrast ideas. The most widely used charting method is the Pro and Con list.

16. CERC.

- A. Claim.**
- B. Evidence.**
- C. Reasoning.**
- D. Conclusion.**

17. Use Smart Notes.

- A. What is big Idea.**
- B. Question.**
- C. Evidence.**
- D. Conclusion.**

Step 54-Simplify The Topic For Myself

First

I. Simplify The Topic For Myself First.

- A. Simplify your explanation so that YOU understand it. As long as the explanation is not simple enough for YOU to understand, spend more hours to break it down to basic, bare-bone, core ideas.
- B. Avoid jargon and complexity. The simpler the explanation, the more likely you are to remember it.
- C. Only Use Simple Words. The words a child would understand.
- D. Anyone can make a subject complicated but only someone who understands can make it simple. Jargon hides our lack of understanding. When forced to write out an idea from start to finish in simple language, you discover where you struggle, where it doesn't quite make sense, where you get frustrated, where you don't really understand as well as you thought. Only by identifying gaps in your knowledge can you fill them.
- E. But true understanding requires a more active process like *teaching*. Start out by formally teaching yourself. Write out a summary in your own words without looking at your notes. Or explain it to yourself out loud. Then take it to the next level by teaching other people. Teaching also initiates a feedback loop, where critique or questions can help us learn and sharpen our thinking.
- F. **It makes it harder to trick yourself.** When you have to truly explain something, whether through writing or aloud, you encounter the holes in your reasoning and the white spaces in your knowledge. Think of writing and teaching as a process to *obtain understanding*, not something you do once you already understand.

Step 55-Reflect, Refine And Simplify

I. Reflect, Refine, and Simplify

- A. Only when you can explain the subject in simple terms do you understand it.
- B. Simple is beautiful.
- C. Review your notes to make sure you didn't mistakenly borrow any jargon or gloss over anything complicated.
- D. Read it out loud as if to a child. If the explanation isn't simple enough or sounds confusing, that's a good indication that you need to reflect and refine.
- E. Go back to the source material, reviewing the parts you don't quite understand yet.
- F. Repeat until you have a simple explanation.

Step 56-Return to the source material if you get stuck. Go back to whatever you're learning from – a book, lecture notes, Journal, Newspaper, podcast or any other resource and source – and fill the gaps in your knowledge.

- 1. Use The Chosen Rules of Reading Method For Analysis, Syntopicon, Research, Investigative Journalism or Mixed Method and Follow Each Steps Of The Method Until Finish All Steps, While Re-listen Lectures, Read Books or Lecture Notes 1-100 Times For Each Step.**
- 2. Following Rules of Reading Methods:**
- 3. Choose One of the Method of Rules of Reading For Following:.**
 - A. VERY VERY FAST Reading- Skimming. Pages 47-51.**
 - B. VERY FAST READING- Entertainment.**
 - II. Method 1-Speed Reading. FAST Reading. Pages 59-64.**
 - C. FAST READING: Methods for Basic Knowledge For Deep Work or Bible Study.**
 - I. Method 1-Survey, Question, Read, Recite, Record, Reflect (SQR4). Pages 66-67.**
 - II. Method 2-Use 80/20 Principle For Reading. Pages 68.**

- III. Method 3-Preview, Question, Read, Summary,Test (PQRST). Page 69.
 - IV. Method 4-Flip Through Pages and Analyse. Page 70.
 - V. Method 5-Devotional Bible Study by Using Devotional Books. Pages 71-72.
 - VI. Method 6-Devotional Bible Read. Pages 73-74.
- D. Deep Work, Deep Study, Bible Study or Any Book- SLOW Reading-Complex Text.
- I. Method 1-Chapter Summary Method. Pages 143-147.
 - II. Method 2-Character Quality Method. Pages 148-160.
 - III. Method 3-Thematic Method. Pages 161-163.
 - IV. Method 4-Biographical Method. Pages 164-176.
 - V. Method 5-Topical Method. Pages 177-180.
 - VI. Method 6-Word Study Method. Pages 181-189.
 - VII. Method 7-Book Background Method. Pages 190-194.
 - VIII. Method 8-Book Survey Method. Pages 195-205.
 - IX. Method 9-Chapter Analysis Method. Pages 206-215.
 - X. Method 10-Paragraph Study. Pages 216-229.
 - XI. Method 11-Verse by Verse Analysis Method. Pages 230-234.
 - XII. Method 12-Book Synthesis Method. Pages 235-238.
 - XIII. Method 13-Theological Study Method of Bible Study. Pages 239-245.
 - XIV. Method 14-Studying Bible Prophecy. Pages 246-259.
 - XV. Method 15-Typological Study Method. Pages 260-262.
 - XVI. Method 16- John MacArthur Way Bible Study. Pages 263-268.
 - XVII. Method 17-Inductive Bible Study Method. Pages 269-296.
 - XVIII. Method 18-BIBLICAL HERMENEUTICS. Pages 297-302.
 - XIX. Method 19-Theological Group of Principles. Pages 303-306.
 - XX. Method 20- How To Read A Book Pages 307.

E. VERY VERY SLOW READING- COMPLEX TEXT. Deep Work, Shallow Work, Bible Study, Analysis of Text, Research, Investigative Journalism, Investigation and Syntopicon, Mixed Method.

I. Method 21- How To Read A Book By Mortimer Adler Various edition Pages 341.

II. Method 22-How To Read A Book For Various Books. Pages 342-600.

III. Method 23- Syntopicon Pages 601-642.

IV. Method 24-The Craft of Research. Pages 644-882.

V. Method 25-Research Books can Be Used. Pages 883-897.

VI. Method 26-Investigative Journalism. Pages 898-923.

VII. Method 27-Mixed Methods of Rules of Reading. Pages 924-942.

4. Learning should be iterative. More often than not, learning something challenging takes several attempts. With the Feynman Technique, returning to the source material is an explicit part of the learning process. When gaps in our knowledge arise and our explanations aren't quite right, revisiting our primary and secondary sources can help solidify what we're learning.
5. Getting it right will likely take several iterations. That's a good thing; the more you refine your explanations, the more your understanding will deepen. Learning becomes an iterative process. Rather than viewing learning as one-and-done, this step gives you permission to continuously refresh your knowledge.
6. You're actively engaged. Using sources to polish our own explanations and models is an active process. When we learn passively, committing details to memory is more challenging. When we're actively part of creating our own summaries and reasoning, drawing intentionally from original information to fill our blind spots, we can more readily commit knowledge to our long-term memory.
7. You expand your knowledge base. Paradoxically, the more we learn, the more *our capacity* to learn increases. Looking through a chapter of a textbook might feel like a different language the first time around. The second time it becomes more clear. The third time, with a strong base already, we pick up nuances we couldn't have possibly seen before.

*PART 7: Thinking, Logic and
Mental Model For Deep Work or
Deep Study, Or Bible Study*

Step 57-Slow Down

- 1. Do Not Rush Any Tasks I will do At Any Time.**
- 2. Listen and Apply Book “The Slow Fix Solve Problems, Work Smarter, and Live Better in a World Addicted to Speed”**
- 3. Listen and Apply Book *In Praise Of Slowness Challenging the Cult of Speed BY Carl Honore.**

- I. We live in a world scarce of understanding and abundant with information. We complain that we never have any free time yet we seek distraction. If work can't distract us, we distract ourselves. We crave perpetual stimulation and motion. We're so busy that our free time comes in 20 second bursts, just long enough for us to read the gist and assume we understand. If we are to synthesize learning and understanding we need time to think.
- II. The modern storm of bits and stimulation, relents only when we sleep. (And then only if we remember to turn off the phone.) Lost in all of this is the art of stillness. We live in a world with more information than ever and yet we understand less. We have come into the belief that the simple act of reading confers understanding. Worse, most of our reading is elementary reading, or skimming — a far cry from syntopical reading, which seems more fertile for the mind willing to do the work.
- III. But that's just it. We don't want, or can't find the time, to do the work that's required to hold an opinion. It's much easier to simply read the opinions of another and let them think for us.
- IV. Understanding comes from focusing, chewing, and relentlessly ragging on a problem. It comes with false starts, dead ends, and frustration. Thinking requires time and space. It's slow. It means saying I don't know. In short, thinking is everything the modern workplace is designed to eradicate.
- V. We're expected to have an opinion about everything and yet our time to think is near zero. We hold more opinions than ever but have less understanding. We don't even understand ourselves. How could it be otherwise?
- VI. As Milan Kundera wrote in his 1996 novella Slowness, “When things happen too fast, nobody can be certain about anything, about anything at all, not even about himself. “In our fast-moving modern world, it always seems that the time-train is

pulling out of the station just as we reach the platform. No matter how fast we go, no matter how cleverly we schedule, there are never enough hours in the day.”

VII. Carl Honore, wrote a book, In Praise of Slowness: Challenging the Cult of Speed, to explore why we’re always in such a rush, what if anything is the cure for time-sickness, and whether it’s desirable to slow down. The book is not an all-out declaration of war against speed. Speed has helped to remake our world in ways that are wonderful and liberating. Who wants to live without the Internet or jet travel? The problem is that our love of speed, our obsession with doing more and more in less and less time, has gone too far; it has turned into an addiction, a kind of idolatry. Even when speed starts to backfire, we invoke the go-faster gospel.

VIII. When we rush, we skim the surface, and fail to make real connections with the world or other people.” Moreover we don’t make connections with ideas. We don’t synthesize. We don’t test theories over time. We don’t play with ideas.

IX. The implications on thinking are fascinating. We are all fast-thinkers now. We have forgotten how to look forward to things, and how to enjoy the moment when they arrive. Restaurants report that hurried diners increasingly pay the bill and order a taxi while eating dessert. Many fans leave sporting events early, no matter how close the score is, simply to steal a march on the traffic. Then there is the curse of multi-tasking. Doing two things at once seems so clever, so efficient, so modern. And yet what it often means is doing two things not very well. Like many people, I read the paper while watching TV— and find that I get less out of both. In this media-drenched, data-rich, channel-surfing, computer-gaming age, we have lost the art of doing nothing, of shutting out the background noise and distractions, of slowing down and simply being alone with our thoughts. Boredom — the word itself hardly existed 150 years ago— is a modern invention. Remove all stimulation, and we fidget, panic and look for something, anything, to do to make use of the time. When did you last see someone just gazing out the window on a train? Everyone is too busy reading the paper, playing video games, listening to iPods, working on the laptop, yammering into mobile phones. Instead of thinking deeply, or letting an idea simmer in the back of the mind, our instinct now is to reach for the nearest sound bite. In modern warfare, correspondents in the field and pundits in the studio spew out instant analyses of events as they occur. Often their insights turn out to be wrong. But that hardly matters nowadays: in the land of speed, the man with the instant response is king. With satellite feeds and twenty-four-hour news channels, the electronic media is dominated by what one

French sociologist dubbed “le fast thinker”— a person who can, without skipping a beat, summon up a glib answer to any question.

- X. Fast eats time. One consequence of fast is that we make poor decision after poor decision. Those decisions don't go away never to be seen again. It's not like we make a bad decision and we're done with it. No, the consequences are much worse. Poor decisions eat time. They come back to haunt you. They create issue after issue. They feed into the perpetual motion machine of busyness. And in a culture where people wear busyness as a badge of honor bad decisions actually lead us to think that we're doing more.

4. Do The Tasks Slowly, and Step By Step.

5. The Art of Slowing down and Do Not Rush Anything.

- I. The Art of Stillness is a persuasively argued case for the pleasures of slowing down and being in one place. Today we're going faster and faster in search of contentment and meaning. This is largely a recipe for ensuring we will never be happy. We have the sense, too often, of running at top speed and never being able to catch up.
- II. Too many of us see going nowhere as turning away from something rather than turning towards something.
- III. Going nowhere isn't about turning your back on the world; it's about stepping away now and then so that you can see the world more clearly and love it more deeply. “There is nothing either good or bad, but thinking makes it so.”
- IV. The idea behind choosing to sit still long enough to learn about yourself is simple and has been around for ages. Marcus Aurelius and Epictetus reminded us many millennia ago that it's how we respond to our experiences, not the experiences themselves, which shape us.
- V. The greatest weapon against stress is our ability to choose one thought over another. Part of making better decisions is making time to think. Something that few of us are able to do.
- VI. “Our creations come not when we're out in the world, gathering impressions, but when we're sitting still, turning those impressions into sentences.

Step 58 - NOT MULTITASK.

1. Of course you can do more than one thing at once. The catch is you can't do more than one thing at once that requires concentration. You can walk and chew gum, but you can't write an email and a report at the same time. When you're doing two things at once that are cognitively demanding, what you're really doing is switching back and forth very quickly from one task to another.
2. There is a mental cost—called a switching cost—to all of this multitasking. But that's not all it makes deep thinking impossible.
3. I think people that multitask pay a huge price. They think they're being extra productive, and I think they're (out of their mind). I use the metaphor of the one-legged man in the ass-kicking contest. I think when you multi-task so much, you don't have time to think about anything deeply. You're giving the world an advantage you shouldn't do. Practically everybody is drifting into that mistake. Concentrating hard on something that is important is. I can't succeed at all without doing it. I did not succeed in life by intelligence. I succeeded because I have a long attention span.
4. It sounds counter-intuitive but if you want to increase discretionary time and reduce stress you need to schedule time to think. The tiny fragments of time many of us find ourselves with have a negative effect on our ability to think deeply about a problem. Furthermore they impede our ability to learn — we stay at a surface level and never move into a deep understanding. Deresiewicz warns: "You simply cannot (think) in bursts of 20 seconds at a time, constantly interrupted by Facebook messages or Twitter tweets, or fiddling with your iPod, or watching something on YouTube."
5. The opposite approach is to focus on a problem or subject and try to achieve a deep fluency. How many of us, however, have time? We don't do the work required to have an opinion. Instead we operate with surface knowledge. We tackle problems with the first thought that comes to mind. Because we make a poor initial decision, we spend countless hours attempting to correct it. No wonder we have no time to think. We're not heeding the advice of Joseph Tussman and letting the world do the work for us.
6. Listen and Apply The Following Books:

A. The Multitasking Mind By Dario Saliveci

Step 59-You Are Required To Do The Work For Thinking and Applying Mental Tool Models.

1. I will Always observe people and their behavior and their argument from aside. Do not tell my arguments, when nobody asked me to tell.
2. Never talk about other people behind their back.
3. Never backstabbing other people for my own gain.
4. Always Listen other people side of story, even I know this is completely lie and fabrication. This allows me to see how far person goes to cover their lies.
5. When Give Opinion on Anything, Do Not Be so Angry and Mean to Others.
6. People Need To Stop Doing By Coming Unprepared To Give Opinion On Any Subject, Without Having Good Idea Of The Literature, and Arguments Written on Topic and Theme Available To Them. The people coming unprepared and not doing any Hard Work To Have an Opinion On The Subject or Topic. When People Coming Overconfidence, which could be resulting in Lack of Preparation, Which Could Lead That Your Position can be Destroyed with Ease. They simply won't do the work required. It's easy to come home, sit on the couch, watch TV, and zone out until bedtime rolls around. But that's not going to help you get smarter.
 - A. People Who Do Not Put The Required Work: The first thing they always do is tell you what they think. When someone has an opinion about everything, they want to share it with you. They often tout stats and research as if they had an imaginary checklist of facts they need to be able to rattle off to establish themselves as an expert in a field they actually know very little about. Because they have an opinion on everything, they are quick to judge others – for their lack of opinions, for their lack of knowledge, for their lack of outrage, and the list goes on.
 - B. People who have opinions about everything barf so much noise that it's hard to find the signal. Your brain has to work overtime to figure out if they did the work to come up with their opinions themselves or if they're simply regurgitating some

oped in a newspaper. Over time, opinionated people also end up in their own prisons and they try to take you with them.

- C. The problem comes from how we see the world. Our opinions are often rooted in how we think the world should work, according to our morals, values, and principles. If we see the world through the lens of our opinions, much of what happens will not agree with us. This is feedback, and how we respond to this feedback is key.

- 7. How to Get Smarter Read. A lot. Warren Buffett says, "I just sit in my office and read all day." What does that mean? He estimates that he spends 80% of his working day reading and thinking. When asked how to get smarter, Buffett once held up stacks of paper and said, "Read 500 pages like this every week. That's how knowledge builds up, like compound interest." All of us can build our knowledge, but most of us won't put in the effort. "Go to bed smarter than when you woke up."

- 8. How Long Does it Take To Prepare:

- A. Depend on the topic and opponent, and how much he's written.
- B. If the opponent nothing published, then there was very little preparation to be made because I simply didn't know what to expect.
- C. On the other hand, if the opponent has published lots of written work and have some videos. Read and what his written and videos and prepare the summaries articles, videos, and have sense where he is coming from. This can take Weeks or Months.

9. Before Preparation. The difference between the people who do the work and the people who just reel off memorized opinions is huge. When you do the work, you can answer the next question. You know when to follow the rules and when they'll get you in trouble. When I did my postgraduate I was surrounded by people who could answer the test questions. They got good grades — actually, they got *great* grades but an odd thing happened after school: a lot of those people couldn't apply their knowledge to problems they hadn't seen before. They were chauffeurs — they knew the memorized answer. They couldn't answer the next question. We're all chauffeurs in some aspects of our lives. This is why understanding your circle of competence is so critical to living a rational life.

I. Circle of Competence:

A. **Circle Of Competence**-Understanding my Circle of Competence helps to avoid problems, identify opportunities for improvement and learn from Others. Circle of Competence is simple: Each of us, through experience or study, has built up useful knowledge on certain areas of the world. Some areas are understood by most of us, while some areas require a lot more specialty to evaluate. For example, most of us have a basic understanding of the economics of a restaurant: You rent or buy space, spend money to outfit the place and then hire employees to seat, serve, cook, and clean. (And, if you don't want to do it yourself, manage.) From there, it's a matter of generating enough traffic and setting the appropriate prices to generate a profit on the food and drinks you serve—after all of your operating expenses have been paid. Though the cuisine, atmosphere, and price points will vary by restaurant, they all have to follow the same economic formula. That basic knowledge, along with some understanding of accounting and a little bit of study, would enable one to evaluate and invest in any number of restaurants and restaurant chains, public or private. It's not all that complicated. Far more important is to honestly define what we do know and stick to those areas. Our circle of competence can be widened, but only slowly and over time. Mistakes are most often made when straying from this discipline. Where should we devote our limited time in life, to achieve the most success? So, the simple takeaway here is clear. If you want to improve your odds of success in life and business, then define the perimeter of your circle of competence, and operate inside. Over time, work to expand that circle

but never fool yourself about where it stands today, and never be afraid to say “I don’t know.”

II. Two Type of Knowledge: The Max Planck and Chauffeur Test

A. The Two Types of Knowledge: The Max Planck and Chauffeur Test: How to distinguish between the two types of knowledge: real knowledge and pretend knowledge.

- The first type of knowledge is real. It can’t be bought. It can’t be copied. If you want real knowledge you need to earn it. One is Planck knowledge, the people who really know. They’ve paid the dues, they have the aptitude. You are going to have the problem in your life of getting the responsibility into the people with the Planck knowledge and away from the people with the chauffeur knowledge. Real knowledge comes when people do the work. The problem is that it’s difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.
- The second type of knowledge is copied. On the surface you know the answer but you lack the understanding to show your work. Then we’ve got chauffeur knowledge. They’ve learned the talk. They may have a big head of hair, they may have fine temper in the voice, they’ll make a hell of an impression. But in the end, all they have is chauffeur knowledge. I think I’ve just described practically every politician in the United States. We have the people who don’t do the work — they pretend. While they’ve learned to put on a good show, they lack understanding. They can’t answer questions that don’t rely on memorization. They can’t explain things without using jargon or vague terms. They have no idea how things interact. They can’t predict the consequences. The problem is that it’s difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.

- How To Distinguish Real Knowledge and Fake Knowledge. With journalists, it is more difficult. Some have acquired true knowledge. Often they are veteran reporters who have specialized for years in a clearly defined area. They make a serious effort to understand the complexity of a subject and to communicate it. They tend to write long articles that highlight a variety of cases and exceptions. The majority of journalists, however, fall into the category of chauffeur. They conjure up articles off the tops of their heads or, rather, from Google searches. Their texts are one-sided, short, and— often as compensation for their patchy knowledge. The same superficiality is present in business. The larger a company, the more the CEO is expected to possess “star quality.” Dedication, solemnity, and reliability are undervalued, at least at the top. Too often shareholders and business journalists seem to believe that showmanship will deliver better results, which is obviously not the case. One way to guard against this is to understand your circle of competence. Dobelli concludes with some advice worth taking to heart. Be on the lookout for chauffeur knowledge. Do not confuse the company spokesperson, the ringmaster, the newscaster, the schmoozer, the verbiage vendor, or the cliché generator with those who possess true knowledge. How do you recognize the difference? There is a clear indicator: True experts recognize the limits of what they know and what they do not know. If they find themselves outside their circle of competence, they keep quiet or simply say, “I don’t know.” This they utter unapologetically, even with a certain pride. From chauffeurs, we hear every line except this.

III. Batesian Mimicry Problem. Batesian Mimicry: Why Copycats Are Successful.

Mimic and the Real Thing:

- A. "There's two kinds of snakes you come across. There's the Texas Coral Snake, and the Mexican Milk Snake, and they both look exactly alike. The Texas Coral Snake is dangerous, it's venomous, it can kill you in a minute. The Mexican Milk Snake can't do anything to you; it's an impostor." How is it that these two look alike? It's due to a phenomenon called Batesian Mimicry.
- B. In the 1850s, the naturalist Henry Walter Bates found a certain set of butterflies who were clearly *not* of the same species but whose wings looked almost the same to the naked eye. After thinking it over, Bates eventually figured out what was going on: While the butterflies which were toxic to potential predators (the "models") were able to operate freely and relatively unmolested, there had also developed a "mimic" population of butterflies which wasn't toxic at all, yet still went untouched! In fact, biologists eventually figured out that the more toxic and dangerous the "model" was and the more frequently they appeared in the local population, the easier it was for its "mimics" to get by! Predators simply wouldn't take the risk of mixing up the two. If there aren't as many "models" around or they aren't that dangerous, the mimics have a harder time.
- C. This is a wonderful model, and in the practical world we live in, a similar phenomenon abounds: Copycats or "pretenders to the throne" are often very effective, very convincing "mimics" of the true champions. They dress the part, they talk the talk, and they know what buttons to push. But in the end, they are merely chauffeurs. We see a very Batesian effect at work: The more impressive the "model," the more effective its mimics can be in convincing people they too are impressive, and in all the same ways. But for every Warren Buffett (just one by our count), there has been many "future" Warren Buffett's. For every Steve Jobs, there have been many "next" Steve Jobs'. In fact, sometimes even just *appearances* can be quite convincing: now-disgraced Theranos founder Elizabeth Holmes was very fond of wearing a very Steve Jobsian black turtleneck outfit. Because they can be very convincing, we must be wise enough to watch out for Batesian mimicry

— even in ourselves. This brings up an interesting, at times paradoxical, question: Who can best tell the difference between a Coral Snake and its Mimics? The Coral Snake itself. The real thing knows a fake. It's worth taking the time to work on learning all the big ideas you can find, not just the ones you want to learn. In that search, you'll find a host of big winners you didn't even know existed.

10. Preparation:

- A. While we all hold an opinion on almost everything. Have I do the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it?
 - I. I have to do the reading.
 - II. I have to talk to competent people and understand their arguments.
 - III. Never try to be biased toward any of the side, but question both side of the argument.
 - IV. Do not support any side, until all the facts are put out there, clear and obvious.
 - V. Once known all the facts then analyse both sides of the argument like William Lane Craig.
 - VI. I have to think about the key variables and how they interact over time.
 - VII. I have to listen and chase down arguments that run counter to your views.
 - VIII. I have to think about how you might be fooling yourself.
 - IX. I have to see the issue from multiple perspectives.
 - X. I have to think.
 - XI. I need to become your most intelligent critic and have the intellectual honesty to kill some of your best-loved ideas.
 - XII. I need to become your most intelligent critic and have the intellectual honesty to kill some of your best-loved ideas.
 - XIII. Be honest with yourself and open minded. ANALYSE both side of the argument logically and see which is true logically. Means has the clear terms, premises are true, and conclusion follows from premises.
 - XIV. Never say your opinion about anything that requires the analysis of the arguments and facts. Work very very hard to have an opinion about anything.

XV.Listen very carefully other side and use ancient method *state the opposition argument in my own words and ask him/her if the argument I stated in my own words represents correctly their argument and if I UNDERSTOOD Correctly their arguments.

XVI.Never use cheap shots to win argument, like logical fallacies.

XVII.Debate and discussion is not about just win at any cost, but let other person to think about your arguments and engage with them. Second reason never use in discussion cheap shots toward other person, but be civil. Third reason is win the debate and discussion. Fourth is find the truth.

B. For Affirmative and Negative Case:

- I. Read, analyse, Research, Syntopicon and Investigate Published Work.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading Deductive and Inductive Methodology.
 - Investigate Line of logic of My own Arguments
- II. Read Opponents Books, Articles, Newspapers, Blogs. Reading Published work. What objections he would raise against the topic and prepare the responses for each of these points.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of opponent Arguments.
- III. Watch Video. Watching Videos of the opponent. What objections he would raise against the topic and prepare the responses for each of these points.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of My own Arguments.
- IV. Listen The recording that the opposition made, in which he addresses these issues.
 - Listen, Use And Apply Rules of Reading Methods Every Steps.
 - Use Grammar in Rules of Reading.
 - Use Logic In Rules of Reading.
 - Investigate Line of logic of My own Arguments.
- V. Talk with People who are students in his class, who can tell me, privately, insights into his thinking and character.
- VI. If that sounds like a lot of work, just say, “I don’t have an opinion on that; why don’t you tell me how you got to have such a firm one? It sounds like I could learn something.”
- VII. Another way to get smarter, outside of reading, is to surround yourself with people who are not afraid to challenge your ideas. “Develop into a lifelong self-learner through voracious reading; cultivate curiosity and strive to become a little wiser every day.”

11. Compound Knowledge- Are The Resources I will Choose Concentrating On the Expiring Information or Compound Knowledge?

- I. Are on the Resources providing expiring information?
 - A. Will you care about what you're reading in a month? In a year? In five years?
 - B. Are you focused enough on the same thing to build cumulative knowledge or are you too spread out?
 - C. What do you spend time on that's likely to change in the next few years? What's not likely to change?
 - D. What would need to happen for you to stop outsourcing organisation of information to the computer?
- II. Signs of The Information in the resources are expiring
 - A. First, it's marketed to you.
 - B. Second, lacking details and nuance, it's easily digestible. This is why it's commonly telling you what happened, not why it happened or under what conditions it might happen again
 - C. Third, it won't be relevant in a month or a year. Expiring information is one reason I stopped reading most news. It's a false map.
- III. While most of us focus on consuming information that we won't care about next month, let alone next year, focus on knowledge and companies that change very, very slowly or not at all. And because the information he was learning changed slowly he could compound his knowledge over time.
- IV. Doing his own thinking and vacuums up the details. When we don't think for ourselves it's easy to put the blame on someone else, to "pass the buck" so to speak.
- V. When we consume information that doesn't expire or expires slowly; is very detailed; and we spend time thinking about it not passing the buck, we can match patterns. This is how you learn to see what other people are missing. The longer you do this, the more advantage you get.
- VI. Just like the rest of us, Buffett's dependent on information and knowledge to make great decisions. Unlike most of us, he has a great memory—perhaps because he's not trying to outsource his memory or thinking to others.
- VII. A lot of what the snowball is about the concept of learning, and creating, and the advantage of having the information and knowing it. When I came here today one

of the things that I was thinking is that what you do is so much at the intersection, because retrieving information is different from having it already in your head.

VIII. What you do is different. You work on manipulating how you use the information.

In fact, Warren Buffett and Charlie Munger have the files in their head. That's why they aren't really out there googling all the time looking for, trying to look stuff up, because they already know it.

IX. I think a lot of the work that you do here is helpful to the ordinary person, but Warren Buffett or Charlie Munger don't need it. At the same time, the lesson that they have, which is that learning yourself, making yourself as smart as you can is extremely valid, and not just relying on a library where you can look something up all the time, because a lot of times when you need to make a decision, and you need 50 pieces of information, you need to know it then.

12. The Art of Anticipation of Objections.

- A. Analyse My Arguments, and Scrutinise The arguments by using Rules of Reading.
- B. Analyse the arguments of the opponent. Scrutinise Their arguments by using Rules of Reading.
- C. Analyse My own arguments. Scrutinise My own arguments, and the potential Loopholes in the argument by Use Rules of Reading.
- D. Use Think, Logic, Stratagem, Thinking models.
- E. Write.
- F. Prepare The responses to anticipated objections that, I think the opponent will bring up.
- G. Be intellectually Prepared. This means That I need to know my arguments, so well, that nothing new can surprise me. I would also invest lots of time in knowing and know better opposite side arguments. I would read both side of the arguments, and work Hard on analysing the arguments and evidence of both sides. Doing the work required to hold an opinion means you can argue against yourself better than others can. Only then can you say, "I can hold this view because I can't find anyone else who can argue better against my view." Great thinkers, like Charles Darwin, did the work. And it's one of the biggest reasons he's buried at Westminster Abbey. While we all hold an opinion on almost everything. Have I do the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it? If that sounds like a lot of work, just say, "I don't have an opinion on that; why don't you tell me how you got to have such a firm one? It sounds like I could learn something."
- H. Doing the work required to hold an opinion means you can argue against yourself better than others can. Only then can you say, "I can hold this view because I can't find anyone else who can argue better against my view." Great thinkers, like Charles Darwin, did the work. And it's one of the biggest reasons he's buried at Westminster Abbey.
- I. Doing the work counteracts our natural desire to seek out only information that confirms what we believe we know. When Darwin encountered opinions or facts that ran contrary to his ideas, he endeavored not only to listen but also not to rest

until he could either argue better than his challengers or understand how the fact fit. Darwin did the work. It's wasn't easy, but that's the point.

- J. Have the best work ethic on daily basis. This is everyday process, and try to figure it out, the strengths and weaknesses of my position and opposing person position, This leads to the True Confidence.
- K. As Per Kobe Bryant statement: Trivial things should not be taken your attention. The attentions should be focused on things that is very important. Anything outside of the most important things in life, you should not have time for. You Should love the challenge in life, and always be curious, if you can be at the top , as these greats in that area. Always focus on one thing and not multiple things, this gives an edge and advantage over other people, who focusing on multiple things in life. The World Becomes a library to you, to be better at your craft.: Everything you see whether TV show I saw, Books, Journals, I read, whether discussion, debate I listen, people I talk to. Everything was done to try to learn to become better at the craft your focusing. When you have this point of view, then the world becomes your library to help you to become better at the craft.
- L. I Always need to ask myself: Have I done the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it? If that sounds like a lot of work, just say, "I don't have an opinion on that; why don't you tell me how you got to have such a firm one? It sounds like I could learn something."
- M. I might need to Suspend my judgement and tell them that I do not have an opinion on this specific Topic.
- N. Never Under Prepare, but Vastly Over Prepare for the Opponent and their arguments and responses
- O. Spend years in preparation, take debate class at the college or university. You need to participate in debates. You need to have mock debates, where someone play role of your opponent, and then you respond to them. You need to do reading and learn how to flow the debates. How to construct affirmative case and negative case. You need to take time to prepare and have enormous preparation.
- P. Memorize the arguments for my case

13. When Dialogue, Discussion, Debate Takes A Place.

A. As Affirmative Speaker, you need to present Prima Facie Case for proposition that is under debate. Prima Facie Case will be one that will establish the truth of proposition you are defending. If I am defending proposition that God Exist, I will want to give 3-5 arguments leading to that Conclusion, that God Exists, and then I will lay those out with great clarity in my opening speech, and say this is the groundwork for the debate. I am not interested in talking about other issues for example if Christianity bad for society Then, I come back to those in every speech over and over again. The goal is to make opponent argue on your grounds. You do not go over to his grounds, and let your audience forget, your affirmative case, rather you reorganise opponent speech, so that you answer his objections in so far as they reply to your arguments, so you may answer them in a very different order than he gave them, because you will be seeing for example: now what answer or response did he have to the cosmological argument, I see two basic responses and then you deal with them.

- Make Briefs, where I have suitable objection, and then have two or three responses to those objections.
- Use The Brief During Exchange with the Opponent. File these Briefs into Folders, and spread These Manila Folders out in front of me on Desk, When I am interacting with the Opponent. Once the opponent Rises his point I just pull These briefs from these folders and never have to think on my feet because I am completely prepared. Key is never have to think on the feet to be so well prepared, that I would have my responses ready for anything he brings up.
- Quote Peer Review Scientific Articles on the topic in support the conclusions.

B. Take Notes While the Opposition is speaking:

- How To Take Notes- Flow Chart. By Taking Notes, I am sure that I am responding to my opponent's arguments and everything he brings up.

- I. Make 11-12 Columns on the Pad. Prepare the left column in advance of the communication, debate. The Left Column needs to be filled in, if you starting first. If not, then leave left column as blank.
- II. First Left Hand Column Are My Arguments.
- III. Second Left Hand Column are Opposition Arguments and Responses to My arguments.
- IV. Third Left Column are My Responses to the Opponent responses.
- V. Fourth Left Hand Column are My Rebuttal.
- VI. Fifth Left Hand Column are Opponent Rebuttal.
- VII. Sixth Left Hand Column are my Responses to the Opponent rebuttal.
- VIII. Seventh Left Hand Column is the Final My Rebuttal.
- IX. Eight Left Hand Column is The opponent Rebuttal.
- X. Ninth Left Hand Column is my closing statements.
- XI. Tenth Left Hand Column is the opponent closing statements.
- XII. Eleventh Left Hand Column is the Cross Examination.
 - My Answer.
 - Opponent Answer.
 - My response to the response of the opponent.

- C. Always Remind the audience what are your three to five arguments and what are the responses of the opponent, if any to your arguments.
- D. Always allow the opponent allow to lay out his argument without interruption.
- E. Take the opponent arguments and put in my own words and correctly represent their argument carefully without misrepresentation.
- F. Be Honest.
- G. Be Open Minded.
- H. Always from Your side be honest and rigorous exchange of arguments and counter Arguments from which me and opponent would benefit.
- I. One of good technique is whenever you can quote an opponent against himself, this is powerful device. Have the manuscript, point to the footnote, cite the book, and the quotation and have the page number.
- J. Never Take Cheap Shots at the Opponent.

- K. Encourage not just trust someone say so, but demand published peer reviewed articles in support of the positions that one take
- L. Always look at the reality of the situation, and do not let the emotion cloud the situation and the execution. Always be in the present and the moment.

Step 60-Why Critical Thinking, Logic, Thinking and Mental Tools Are Important?

1. After Reading, Analyse, Research and Arguing with the text, then I need to Decide and apply the Logic, Mental Models and thinking model that helps to understand the complexity of the world.
2. If you can think through things better than others, you'll have fewer problems and more free time. If you can't, you're going to spend a lot of time fixing your mistakes. Good decisions make the future easier, bad ones make it harder.
3. The investigators wanted to figure out how today's college students were able to multitask so much more effectively than adults. How do they manage to do it, the researchers asked? The answer, they discovered—and this is by no means what they expected—is that they don't. The enhanced cognitive abilities the investigators expected to find, the mental faculties that enable people to multitask effectively, were simply not there. In other words, people do not multitask effectively. And here's the really surprising finding: the more people multitask, the worse they are, not just at other mental abilities, but at multitasking itself.
4. Multitasking, in short, is not only not thinking, it impairs your ability to think. Thinking means concentrating on one thing long enough to develop an idea about it. Not learning other people's ideas, or memorizing a body of information, however much those may sometimes be useful. Developing your own ideas.
5. The best way to improve your ability to think is to spend large chunks of time thinking. Immersing ourselves in the problem offers insights that can't be gained otherwise. One way to force yourself to slow down and think is to write. Good writing requires good thinking.
6. Good writing, like good thinking, takes time.

7. One heuristic to tell how good someone is at making decisions is by how much time they have. The busiest people are often the ones who make the worst decisions. Not only do they have less time to dedicate to thinking about the problem, but they are often busy correcting poor decisions from the past.
8. Good thinking is expensive. Bad thinking costs a fortune. Rather than accept that good thinking requires time, most people try to bargain with reality. Unfortunately, that is not how the world works. If you want to think better, schedule time to write out your thoughts.
9. Why is important Different type of Thinking to the reality:
 - I. Using Multidisciplinary Thinking to Approach Problems in a Complex World. Complex outcomes in human systems are a tough nut to crack when it comes to deciding what's really true. Any phenomena we might try to explain will have a host of competing theories, many of them seemingly plausible.
 - II. Cross-checks" from a variety of sources of data, developing a 3D view of the landscape he's trying to assess
 - III. So why is it important to be a multidisciplinary thinker? The answer comes from the Austrian philosopher Ludwig Wittgenstein, who said, "To understand is to know what to do." Could there be anything that sounds simpler than that? And yet it's a genius line—"to understand is to know what to do." How many mistakes do you make when you understand something? You don't make any mistakes. Where do mistakes come from? They come from blind spots, a lack of understanding. Why do you need to be multidisciplinary in your thinking? Because as the Japanese proverb says, "The frog in the well knows nothing of the mighty ocean."
 - IV. You may know everything there is to know about your specialty, your silo, your "well," but how are you going to make any good decisions in life—the complex systems of life, the dynamic system of life—if all you know is one well?
 - V. We observe an interesting phenomenon in need of explanation, one we feel capable of exploring. So out of necessity, we must approach the problem in a different way
 - VI. We propose and examine competing hypotheses that would explain the phenomena (set up in a falsifiable way, in harmony with the divide between science and pseudoscience laid out for us by the great Karl Popper).

- VII. Cross-checks” from a variety of sources of data, developing a 3D view of the landscape he’s trying to assess.
- VIII. *Look* we can’t just rely on “plausible narratives” generated by folks like the historians. There are too many possibilities that could be correct. Nor can we rely purely on correlations (i.e., the rise in literacy statistically tracking the decline in violence) — they don’t necessarily offer us a causative explanation. (Does the rise in literacy *cause* less violence, or is it vice versa? Or, does a third factor cause both?) However, if we layer in some other known facts from areas we can experiment on — say, psychology or cognitive neuroscience — we can sometimes establish the causal link we need or, at worst, a better hypothesis of reality.
- IX. We examine a cross-section of: Empirical data relating to the phenomena; sensible qualitative inference (from multiple fields/disciplines, the more fundamental the better), and finally; “Demonstrable” aspects of nature we are nearly certain about, arising from controlled experiment or other rigorous sources of knowledge ranging from engineering to biology to cognitive neuroscience.
- X. What we end up with is not necessarily a bulletproof explanation, but probably the best we can do if we think carefully. A good cross-disciplinary examination with quantitative and qualitative sources coming into equal play, and a good dose of judgment, can be far more rigorous than the gut instinct or plausible nonsense type stories that many of us lazily spout.
- XI. A Word of Caution: Although Pinker’s “multiple vertices” approach to problem solving in complex domains can be powerful, we always have to be on guard for phenomena that we simply cannot explain at our current level of competence: We must have a “too hard” pile when competing explanations come out “too close to call” or we otherwise feel we’re outside of our circle of competence. Always tread carefully and be sure to follow Darwin’s Golden Rule: Contrary facts are more important than confirming ones. Be ready to change your mind, like Darwin, when the facts don’t go your way.
- XII. Using a true multidisciplinary understanding of things, Peter identifies two often overlooked, parabolic “Big Ideas”: 1) Mirrored Reciprocation (go positive and go first) and 2) Compound Interest (being constant). A great “Life Hack” is to simply combine these two into one basic approach to living your life: “Go positive and go first, and be constant in doing it.” There may be no better formula for living the best life you could possibly live.

Step 61-Intradisciplinary Thinking

1. Step 1 Define Intradisciplinary Thinking-Intradisciplinary Thinking. Intradisciplinary Thinking is within a single academic discipline. This is simply thinking within a scope of one academic discipline. Intradisciplinary working is within one discipline. Like a single ingredient, clearly distinguishable. Let's review the process that Pinker has laid out, one that we might think about emulating as we examine the causes of complex phenomena in human systems:

- I. We observe an interesting phenomenon in need of explanation, one we feel capable of exploring.
- II. We propose and examine competing hypotheses that would explain the phenomena (set up in a falsifiable way, in harmony with the divide between science and pseudoscience laid out for us by the great Karl Popper).
- III. We examine a cross-section of: Empirical data relating to the phenomena; sensible qualitative inference (from multiple fields/disciplines, the more fundamental the better), and finally; "Demonstrable" aspects of nature we are nearly certain about, arising from controlled experiment or other rigorous sources of knowledge ranging from engineering to biology to cognitive neuroscience.

IV. Listen and Apply The Following Books:

- **How we can Assess the Level of Interdisciplinarity and Transdisciplinarity of Academic Institutions? By Mahmood Ramezanzade**
- **Detection of Distributed Denial of Service (DDoS) Attacks in IOT Based Monitoring System of Banking Sector Using Machine Learning Models By Muhsmmsf Shafiq**

2. Step 2-Do Work Required to Have an Opinion on Any Topic and Anything.

- I. Most people go through life not really getting any smarter. Why? They simply won't do the work required. It's easy to come home, sit on the couch, watch TV, and zone out until bedtime rolls around. But that's not going to help you get smarter.
- II. You can acquire knowledge if you want it. In fact, there is a simple formula, which if followed is almost certain to make you smarter over time. Simple but not easy. It involves a lot of hard work. "The best thing a human being can do is to help another human being know more."
- III. How to Get Smarter Read. A lot. Warren Buffett says, "I just sit in my office and read all day." What does that mean? He estimates that he spends 80% of his working day reading and thinking. When asked how to get smarter, Buffett once held up stacks of paper and said, "Read 500 pages like this every week. That's how knowledge builds up, like compound interest." All of us can build our knowledge, but most of us won't put in the effort. "Go to bed smarter than when you woke up."
- IV. Knowledge accumulation as an acquired, rather than natural, genius. And he'd give all the credit to the studying;.
- V. The first thing they always do is tell you what they think. When someone has an opinion about everything, they want to share it with you. They often tout stats and research as if they had an imaginary checklist of facts they need to be able to rattle off to establish themselves as an expert in a field they actually know very little about. Because they have an opinion on everything, they are quick to judge others – for their lack of opinions, for their lack of knowledge, for their lack of outrage ... the list goes on.
- VI. People who have opinions about everything barf so much noise that it's hard to find the signal. Your brain has to work overtime to figure out if they did the work to come up with their opinions themselves or if they're simply regurgitating some op-ed in a newspaper. Over time, opinionated people also end up in their own prisons and they try to take you with them.
- VII. The problem comes from how we see the world. Our opinions are often rooted in how we think the world should work, according to our morals, values, and principles. If we see the world through the lens of our opinions, much of what happens will not agree with us. This is feedback, and how we respond to this feedback is key.

VIII. While we all hold an opinion on almost everything. Have I do the work required to have an opinion on any Subject? Never allow myself to have an opinion on anything that I don't know the other side's argument better than they do. The work required to have an opinion is very hard part, have I avoid it?

- I have to do the reading.
- I have to do Thinking and mental model.
- I have to talk to competent people and understand their arguments.
- I have to think about the key variables and how they interact over time.
- I have to listen and chase down arguments that run counter to your views.
- I have to think about how you might be fooling yourself.
- I have to see the issue from multiple perspectives.
- I have to think.
- I need to become your most intelligent critic and have the intellectual honesty to kill some of your best-loved ideas.

IX. If that sounds like a lot of work, just say, "I don't have an opinion on that; why don't you tell me how you got to have such a firm one? It sounds like I could learn something."

X. We all are learning, modifying, or destroying ideas all the time. Rapid destruction of your ideas when the time is right is one of the most valuable qualities you can acquire. You must force yourself to consider arguments on the other side. As Rabbi Moses ben Maimon (1135–1204), commonly known as Maimonides, said: "Teach thy tongue to say I do not know, and thou shalt progress."

XI. Doing the work required to hold an opinion means you can argue against yourself better than others can. Only then can you say, "I can hold this view because I can't find anyone else who can argue better against my view." Great thinkers, like Charles Darwin, did the work. And it's one of the biggest reasons he's buried at Westminster Abbey.

XII. Doing the work counteracts our natural desire to seek out only information that confirms what we believe we know. When Darwin encountered opinions or facts that ran contrary to his ideas, he endeavored not only to listen but also not to rest until he could either argue better than his challengers or understand how the fact fit. Darwin did the work. It's wasn't easy, but that's the point.

XIII. The difference between the people who do the work and the people who just reel off memorized opinions is huge. When you do the work, you can answer the next

question. You know when to follow the rules and when they'll get you in trouble. When I did my postgraduate I was surrounded by people who could answer the test questions. They got good grades — actually, they got *great* grades but an odd thing happened after school: a lot of those people couldn't apply their knowledge to problems they hadn't seen before. They were chauffeurs — they knew the memorized answer. They couldn't answer the next question. We're all chauffeurs in some aspects of our lives. This is why understanding your circle of competence is so critical to living a rational life.

- Circle of Competence:

- **Circle Of Competence**-Understanding my Circle of Competence helps to avoid problems, identify opportunities for improvement and learn from Others. Circle of Competence is simple: Each of us, through experience or study, has built up useful knowledge on certain areas of the world. Some areas are understood by most of us, while some areas require a lot more specialty to evaluate. For example, most of us have a basic understanding of the economics of a restaurant: You rent or buy space, spend money to outfit the place and then hire employees to seat, serve, cook, and clean. (And, if you don't want to do it yourself, manage.) From there, it's a matter of generating enough traffic and setting the appropriate prices to generate a profit on the food and drinks you serve —after all of your operating expenses have been paid. Though the cuisine, atmosphere, and price points will vary by restaurant, they all have to follow the same economic formula. That basic knowledge, along with some understanding of accounting and a little bit of study, would enable one to evaluate and invest in any number of restaurants and restaurant chains, public or private. It's not all that complicated. Far more important is to honestly define what we do know and stick to those areas. Our circle of competence can be widened, but only slowly and over time. Mistakes are most often made when straying from this discipline. Where should we devote our limited time in life, to achieve the most success? So, the simple takeaway here is clear. If you want to improve your odds of success in life and business, then define the perimeter of your circle of competence, and operate inside. Over time, work to expand that circle but never fool yourself about where it stands today, and never be afraid to say "I don't know."

- The Two Types of Knowledge: The Max Planck and Chauffeur Test: How to distinguish between the two types of knowledge: real knowledge and pretend knowledge.
 - The first type of knowledge is real. It can't be bought. It can't be copied. If you want real knowledge you need to earn it. One is Planck knowledge, the people who really know. They've paid the dues, they have the aptitude. You are going to have the problem in your life of getting the responsibility into the people with the Planck knowledge and away from the people with the chauffeur knowledge. Real knowledge comes when people do the work. The problem is that it's difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.
 - The second type of knowledge is copied. On the surface you know the answer but you lack the understanding to show your work. Then we've got chauffeur knowledge. They've learned the talk. They may have a big head of hair, they may have fine temper in the voice, they'll make a hell of an impression. But in the end, all they have is chauffeur knowledge. I think I've just described practically every politician in the United States. We have the people who don't do the work — they pretend. While they've learned to put on a good show, they lack understanding. They can't answer questions that don't rely on memorization. They can't explain things without using jargon or vague terms. They have no idea how things interact. They can't predict the consequences. The problem is that it's difficult to separate the two. This is the Batesian Mimicry problem. One way to tease out the difference between Planck and chauffeur knowledge is to ask them why.
 - How To Distinguish Real Knowledge and Fake Knowledge. With journalists, it is more difficult. Some have acquired true knowledge. Often they are veteran reporters who have specialized for years in a clearly defined area. They make a serious effort to understand the complexity of a subject and to communicate it. They tend to write long articles that highlight a variety of cases and exceptions. The majority of journalists, however, fall into the category of chauffeur. They conjure up

articles off the tops of their heads or, rather, from Google searches. Their texts are one-sided, short, and— often as compensation for their patchy knowledge. The same superficiality is present in business. The larger a company, the more the CEO is expected to possess “star quality.” Dedication, solemnity, and reliability are undervalued, at least at the top. Too often shareholders and business journalists seem to believe that showmanship will deliver better results, which is obviously not the case. One way to guard against this is to understand your circle of competence. Dobelli concludes with some advice worth taking to heart. Be on the lookout for chauffeur knowledge. Do not confuse the company spokesperson, the ringmaster, the newscaster, the schmoozer, the verbiage vendor, or the cliché generator with those who possess true knowledge. How do you recognize the difference? There is a clear indicator: True experts recognize the limits of what they know and what they do not know. If they find themselves outside their circle of competence, they keep quiet or simply say, “I don’t know.” This they utter unapologetically, even with a certain pride. From chauffeurs, we hear every line except this.

- Batesian Mimicry Problem. Batesian Mimicry: Why Copycats Are Successful. Mimic and the Real Thing:
 - “There’s two kinds of snakes you come across. There’s the Texas Coral Snake, and the Mexican Milk Snake, and they both look exactly alike. The Texas Coral Snake is dangerous, it’s venomous, it can kill you in a minute. The Mexican Milk Snake can’t do anything to you; it’s an impostor.”How is it that these two look alike? It’s due to a phenomenon called Batesian Mimicry.
 - In the 1850s, the naturalist Henry Walter Bates found a certain set of butterflies who were clearly *not* of the same species but whose wings looked almost the same to the naked eye. After thinking it over, Bates eventually figured out what was going on: While the butterflies which were toxic to potential predators (the “models”) were able to operate freely and relatively unmolested, there had also developed a “mimic” population of butterflies which wasn’t toxic at all, yet still went untouched! In fact, biologists eventually figured out that the more toxic and dangerous the “model” was and the more frequently they appeared in the local population, the easier it was for its “mimics” to get by! Predators simply wouldn’t take the risk of mixing up the two. If there aren’t as many “models” around or they aren’t that dangerous, the mimics have a harder time.
 - This is a wonderful model, and in the practical world we live in, a similar phenomenon abounds: Copycats or “pretenders to the throne” are often very effective, very convincing “mimics” of the true champions. They dress the part, they talk the talk, and they know what buttons to push. But in the end, they are merely chauffeurs. We see a very Batesian effect at work: The more impressive the “model,” the more effective its mimics can be in convincing people they too are impressive, and in all the same ways. But for every Warren Buffett (just one by our count), there has been many “future” Warren Buffett’s. For every Steve Jobs, there have been many “next” Steve Jobs’. In fact, sometimes even just *appearances* can be quite convincing: now-disgraced Theranos founder Elizabeth Holmes was very fond of wearing a very Steve Jobsian black turtleneck outfit. Because they can be very convincing, we must be wise enough to watch out for Batesian mimicry

— even in ourselves. This brings up an interesting, at times paradoxical, question: Who can best tell the difference between a Coral Snake and its Mimics? The Coral Snake itself. The real thing knows a fake. It's worth taking the time to work on learning all the big ideas you can find, not just the ones you want to learn. In that search, you'll find a host of big winners you didn't even know existed.

XIV. The ability to destroy your ideas rapidly instead of slowly when the occasion is right is one of the most valuable things. You have to work hard on it. Ask yourself what are the arguments on the other side. It's bad to have an opinion you're proud of if you can't state the arguments for the other side better than your opponents. This is a great mental discipline.

XV. Doing the work means you can't make up your mind with a high degree of confidence right away. Doing the work forces you to challenge your beliefs because you have to argue from both sides. You become the somewhat impartial judge. What's on trial is your opinion. If you want to work with the world rather than against it, one of the major leverage points you can put effort into is how to distinguish between the people who've done the work and those who haven't. The ones who have will pass the Batesian Mimicry Test.

XVI. As Per Kobe Bryant statement: Trivial things should not be taken your attention. The attentions should be focused on things that is very important. Anything outside of the most important things in life, you should not have time for. You Should love the challenge in life, and always be curious, if you can be at the top , as these greats in that area. Always focus on one thing and not multiple things, this gives an edge and advantage over other people, who focusing on multiple things in life. The World Becomes a library to you, to be better at your craft.: Everything you see whether TV show I saw, Books, Journals, I read, whether discussion, debate I listen, people I talk to. Everything was done to try to learn to become better at the craft your focusing. When you have this point of you, then the world becomes your library to help you to become better at the craft.

XVII. Have the best work ethic on daily basis. This is everyday process, and try to figure it out, the strengths and weaknesses of my position and opposing person position.

XVIII. Always look at the reality of the situation, and do not let the emotion cloud the situation and the execution. Always be in the present and the moment.

XIX. We read a lot. I don't know anyone who's wise who doesn't read a lot. But that's not enough: You have to have a temperament to grab ideas and do sensible things. Most people don't grab the right ideas or don't know what to do with them.

XX. Another way to get smarter, outside of reading, is to surround yourself with people who are not afraid to challenge your ideas. "Develop into a lifelong self-learner through voracious reading; cultivate curiosity and strive to become a little wiser every day."

3. Step 3- Slow Down

I. Do Not Rush Thinking Process, and Do it Very Slow.

II. Do Not Rush Any Task I will do At Any Time.

III. Listen and Apply Book “The Slow Fix Solve Problems, Work Smarter, and Live Better in a World Addicted to Speed”

IV. Listen and Apply Book *In Praise Of Slowness Challenging the Cult of Speed BY Carl Honore.

- We live in a world scarce of understanding and abundant with information. We complain that we never have any free time yet we seek distraction. If work can't distract us, we distract ourselves. We crave perpetual stimulation and motion. We're so busy that our free time comes in 20 second bursts, just long enough for us to read the gist and assume we understand. If we are to synthesize learning and understanding we need time to think.
- The modern storm of bits and stimulation, relents only when we sleep. (And then only if we remember to turn off the phone.) Lost in all of this is the art of stillness. We live in a world with more information than ever and yet we understand less. We have come into the belief that the simple act of reading confers understanding. Worse, most of our reading is elementary reading, or skimming — a far cry from syntopical reading, which seems more fertile for the mind willing to do the work.
- But that's just it. We don't want, or can't find the time, to do the work that's required to hold an opinion. It's much easier to simply read the opinions of another and let them think for us.
- Understanding comes from focusing, chewing, and relentlessly ragging on a problem. It comes with false starts, dead ends, and frustration. Thinking requires time and space. It's slow. It means saying I don't know. In short, thinking is everything the modern workplace is designed to eradicate.
- We're expected to have an opinion about everything and yet our time to think is near zero. We hold more opinions than ever but have less understanding. We don't even understand ourselves. How could it be otherwise?
- As Milan Kundera wrote in his 1996 novella Slowness, “When things happen too fast, nobody can be certain about anything, about anything at all, not even about himself. “In our fast-moving modern world, it always

seems that the time-train is pulling out of the station just as we reach the platform. No matter how fast we go, no matter how cleverly we schedule, there are never enough hours in the day.”

- Carl Honore, wrote a book, In Praise of Slowness: Challenging the Cult of Speed, to explore why we’re always in such a rush, what if anything is the cure for time-sickness, and whether it’s desirable to slow down. The book is not an all-out declaration of war against speed. Speed has helped to remake our world in ways that are wonderful and liberating. Who wants to live without the Internet or jet travel? The problem is that our love of speed, our obsession with doing more and more in less and less time, has gone too far; it has turned into an addiction, a kind of idolatry. Even when speed starts to backfire, we invoke the go-faster gospel.
- When we rush, we skim the surface, and fail to make real connections with the world or other people.” Moreover we don’t make connections with ideas. We don’t synthesize. We don’t test theories over time. We don’t play with ideas.
- The implications on thinking are fascinating. We are all fast-thinkers now. We have forgotten how to look forward to things, and how to enjoy the moment when they arrive. Restaurants report that hurried diners increasingly pay the bill and order a taxi while eating dessert. Many fans leave sporting events early, no matter how close the score is, simply to steal a march on the traffic. Then there is the curse of multi-tasking. Doing two things at once seems so clever, so efficient, so modern. And yet what it often means is doing two things not very well. Like many people, I read the paper while watching TV— and find that I get less out of both. In this media-drenched, data-rich, channel-surfing, computer-gaming age, we have lost the art of doing nothing, of shutting out the background noise and distractions, of slowing down and simply being alone with our thoughts. Boredom— the word itself hardly existed 150 years ago— is a modern invention. Remove all stimulation, and we fidget, panic and look for something, anything, to do to make use of the time. When did you last see someone just gazing out the window on a train? Everyone is too busy reading the paper, playing video games, listening to iPods, working on the laptop, yammering into mobile phones. Instead of thinking deeply, or letting an idea simmer in the back of the mind, our instinct now is to reach for the

nearest sound bite. In modern warfare, correspondents in the field and pundits in the studio spew out instant analyses of events as they occur. Often their insights turn out to be wrong. But that hardly matters nowadays: in the land of speed, the man with the instant response is king. With satellite feeds and twenty-four-hour news channels, the electronic media is dominated by what one French sociologist dubbed “le fast thinker”— a person who can, without skipping a beat, summon up a glib answer to any question.

- Fast eats time. One consequence of fast is that we make poor decision after poor decision. Those decisions don’t go away never to be seen again. It’s not like we make a bad decision and we’re done with it. No, the consequences are much worse. Poor decisions eat time. They come back to haunt you. They create issue after issue. They feed into the perpetual motion machine of busyness. And in a culture where people wear busyness as a badge of honor bad decisions actually lead us to think that we’re doing more.

V. Do The Tasks Slowly, and Step By Step.

VI. The Art of Slowing down and Do Not Rush Anything.

- The Art of Stillness is a persuasively argued case for the pleasures of slowing down and being in one place. Today we’re going faster and faster in search of contentment and meaning. This is largely a recipe for ensuring we will never be happy. We have the sense, too often, of running at top speed and never being able to catch up.
- Too many of us see going nowhere as turning away from something rather than turning towards something.
- Going nowhere isn’t about turning your back on the world; it’s about stepping away now and then so that you can see the world more clearly and love it more deeply. “There is nothing either good or bad, but thinking makes it so.”
- The idea behind choosing to sit still long enough to learn about yourself is simple and has been around for ages. Marcus Aurelius and Epictetus reminded us many millennia ago that it’s how we respond to our experiences, not the experiences themselves, which shape us.

- The greatest weapon against stress is our ability to choose one thought over another. Part of making better decisions is making time to think. Something that few of us are able to do.
- “Our creations come not when we’re out in the world, gathering impressions, but when we’re sitting still, turning those impressions into sentences.

4. Step 4- Do not Multitask.

- I. Of course you can do more than one thing at once. The catch is you can’t do more more than one thing at once that requires concentration. You can walk and chew gum, but you can’t write an email and a report at the same time. When you’re doing two things at once that are cognitively demanding, what you’re really doing is switching back and forth very quickly from one task to another.
- II. There is a mental cost—called a switching cost—to all of this multitasking. But that’s not all it makes deep thinking impossible.
- III. I think people that multitask pay a huge price. They think they’re being extra productive, and I think they’re (out of their mind). I use the metaphor of the one-legged man in the ass-kicking contest. I think when you multi-task so much, you don’t have time to think about anything deeply. You’re giving the world an advantage you shouldn’t do. Practically everybody is drifting into that mistake. Concentrating hard on something that is important is. I can’t succeed at all without doing it. I did not succeed in life by intelligence. I succeeded because I have a long attention span.
- IV. It sounds counter-intuitive but if you want to increase discretionary time and reduce stress you need to schedule time to think. The tiny fragments of time many of us find ourselves with have a negative effect on our ability to think deeply about a problem. Furthermore they impede our ability to learn — we stay at a surface level and never move into a deep understanding. Deresiewicz warns: “You simply cannot (think) in bursts of 20 seconds at a time, constantly interrupted by Facebook messages or Twitter tweets, or fiddling with your iPod, or watching something on YouTube.”
- V. The opposite approach is to focus on a problem or subject and try to achieve a deep fluency. How many of us, however, have time? We don’t do the work required to have an opinion. Instead we operate with surface knowledge. We tackle problems with the first thought that comes to mind. Because we make a

poor initial decision, we spend countless hours attempting to correct it. No wonder we have no time to think. We're not heeding the advice of Joseph Tussman and letting the world do the work for us.

VI. Listen and Apply The Following Books:

- **The Multitasking Mind By Dario Saliveci**

5. Step 5-What is Thinking.

I. Thinking Rate.

- **You can't force yourself to think faster. If you try, you're likely to end up making much worse decisions. Here's how to improve the actual quality of your decisions instead of chasing hacks to speed them up.**
- **When the product of your job is your decisions, you might find yourself wanting to be able to make more decisions more quickly so you can be more productive overall.**
- **Chasing speed is a flawed approach. Because decisions—at least good ones—don't come out of thin air. They're supported by a lot of thinking.**

II. Beyond The Hurry Culture

- **Everyone is trying to work faster at all times, and they pressure everyone around them to work faster, too.**
- **All of these things increase pressure in the work environment and repeatedly reinforce the “hurry up!” message. They make managers feel like they're moving things along faster. That way if work isn't getting done, it's not their fault. But, DeMarco writes, they don't lead to meaningful changes in behavior that make the whole organization more productive. Speeding up often results in poor decisions that create future problems.**
- **The reason more pressure doesn't mean better productivity is that the rate at which we think is fixed. We can't force ourselves to start making faster decisions right now just because we're faced with an unrealistic deadline. DeMarco writes, “*Think rate is fixed. No matter what you do, no matter how hard you try, you can't pick up the pace of thinking.*”**

III. Elements of Effective Thinking.

- **Understand Deeply.** Don't face complex issues head-on; first understand simple ideas deeply. Clear the clutter and expose what is really important. Be brutally honest about what you know and don't know. Then see what's missing, identify the gaps, and fill them in. Let go of bias, prejudice, and preconceived notions. There are degrees to understanding (it's not just a yes-or-no proposition) and you can always heighten yours. Rock-solid understanding is the foundation for success.
- **Make Mistakes.** Fail to succeed. Intentionally get it wrong to inevitably get it even more right. Mistakes are great teachers — they highlight unforeseen opportunities and holes in your understanding. They also show you which way to turn next, and they ignite your imagination.
- **Raise Questions.** Constantly create questions to clarify and extend your understanding. What's the real question? Working on the wrong questions can waste a lifetime. Ideas are in the air — the right questions will bring them out and help you see connections that otherwise would have been invisible.
- **Follow the Flow of Ideas.** Look back to see where ideas came from and then look ahead to discover where those ideas may lead. A new idea is a beginning, not an end. Ideas are rare— milk them. Following the consequences of small ideas can result in big payoffs. These are the four basic building blocks for effective thinking. The fifth is Change.
- **Change.** The unchanging element is change— by mastering the first four elements, you can change the way you think and learn. You can always improve, grow, and extract more out of your education, yourself, and the way you live your life. Change is the universal constant that allows you to get the most out of living and learning.

6. Step 6-Collect As Many mental models as Possible from diverse domains and academic disciplines That I think is suitable for my situation or Information provided by the Text, Book, Speech etc. Research a broad range of industries to identify mental models that can be integrated and Most Suitable into area of work or focus. In identifying the Great Mental Models we have to look for elementary principles, the ideas from multiple disciplines that form a time tested foundation, these mental models would be from Elementary Mental Models to most Advanced Mental Models. It may seem counterintuitive, to work on developing knowledge that is available to everyone, but the universe works in the same way no matter where you are in it or how you think the universe should be working. What you need is to understand the principles, so that when the details change you are still able to identify what is really going on. Listen and Follow Every Book on Each Mental models.

A. General Mental Models For Thinking.

I. The Great Mental Models Volume 1 By Fs Blog.

- The Map is Not The Territory.
- Circle of Competence.
- The first Principles Thinking.
- Though Experiment.
- Second Order Thinking.
- Probabilistic Thinking.
- Inversion.
- Occam's Razor.
- Hanlon's Razor.
- Supporting Ideas.
- Falsifiability.
- Necessity and Sufficiency.
- Causation vs Correlation.
- The 48 Laws of Power By Robert Greene
- How to Think By John Dewey

II. The Great Mental Models Volume 2 By Fs Blog.

- Physics.
 - Relativity.
 - Reciprocity.

- Thermodynamics.
- Inertia.
- Friction and Viscosity.
- Velocity
- Leverage.

- Chemistry.
 - Activation Energy.
 - Catalysts.
 - Alloying,

- Biology.
 - Evolution Part One: Natural Selection and Extinction.
 - Evolution Part two: Adaptation Rate and The Red Queen Effect.
 - Supporting Idea: Competition.
 - Ecosystem.
 - Niche.
 - Self Preservation.
 - Replication.
 - Cooperation.
 - Supporting Idea: Dunbar's Number.
 - Hierarchical Organisation.
 - Incentives.
 - Tendency to Minimize energy Output.

III. The Great Mental Models Volume 3 By Fs Blog.

- Systems.
 - Feedback Loops.
 - Equilibrium.
 - Bottlenecks.
 - Scale.
 - Margin of Safety.
 - Churn.
 - Algorithms.

- Supporting Idea: Complex Adaptive Systems.
- Critical mass.
- Emergence.
- Supporting Idea: Chaos Dynamics.
- Irreducibility.
- Law of Diminishing Returns.
- Mathematics.
 - Supporting Idea: Distribution.
 - Compounding.
 - Supporting Idea; Network Effect.
 - Sampling.
 - Randomness.
 - Supporting idea: Pareto Principle.
 - Regression to the mean.
 - Multiplying by ZERO.
 - Equivalence.
 - Supporting idea: order of Magnitude.
 - Surface Area.
 - Global and local Maxima.

IV. The Great Mental Models By Tommy Tedford.

- First Principles Mental model.
- Classical Condition.
- Cognitive Biases.
- Circle Of Competence Mental Model.
- Eisenhower Matrix.

V. 100 Mental Models- Be Rational by Wisdom Theory.
